

APPENDIX D – HAZARDOUS MATERIALS EVALUATION

Compensatory Stormwater Management Sites for the I-495 and I-270 Managed Lanes Study

APPENDIX D: Hazardous Materials Desktop Evaluations

1. Background

Hazardous Materials Evaluations were conducted at each of the compensatory Stormwater Management (SWM) facility Limit of Disturbances (LODs) and larger stream restoration LODs. Seven hundred and thirty-nine (739) SWM facility LODs and fifteen (15) stream restoration LODs have been reviewed and are included in this document. The goal of each evaluation was to identify potential soil, groundwater, soil vapor, or debris-impacted potential sites of concern (PSOCs) or Recognized Environmental Conditions (RECs) such as a chemical/petroleum storage tank on or in close proximity to the LOD that could create an unsafe or hazardous situation during any intrusive groundwork. The evaluations were conducted in modified/limited accordance with Environmental Protection Agency (EPA) Standards and Practices for All Appropriate Inquiries as required under Section 101(35)(B) of the federal Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) or Superfund Law as specified in Title 40 Code of Federal Regulations (CFR) Part 312; and the ASTM International (ASTM) Standard for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM E 1527-13).

PSOCs on or in close proximity to the LOD were identified through an LOD-specific environmental regulatory database search, as well as review of historical information such as aerial photographs, topographic maps and regulatory files via Public Information Act (PIA) requests. Taking into account the local topographic/hydraulic gradient around each LOD, the LODs were assigned an overall risk classification of “high”, “moderate” or “low.” Brief summaries of each LOD grouped by classification are provided in Attachment 1 - High Risk LODs, Attachment 2 - Moderate Risk LODs, and Attachment 3 - Low Risk LODs. A summary of the risk classification is provided in Section 3.1, below.

2. Methodology and Assumptions

2.1 Environmental Database Records Review

WSP retained Environmental Risk Information Services, Inc. (ERIS) to search federal, state and tribal regulatory databases to identify environmental issues that have been reported for each LOD within the study area. PSOCs that have the greatest potential to have caused environmental contamination are those that have had releases or spills of hazardous substances or petroleum products located upgradient, adjacent to, or within the LOD. Regional topography and proximity to water resources (e.g., streams/rivers and ponds) were taken into account to determine local groundwater flow in the vicinity of each LOD.

For this limited hazardous materials evaluation, a modified search distance of 1/8th mile was used instead of the standard ASTM E 1527-13 and AAI Standard (40 CFR 312.26(c)) search radii distances for the initial hazardous materials screen of each LOD, as PSOCs with environmental impacts (e.g., leaking underground storage tanks [LUSTs] and known petroleum/hazardous material releases within 1/8th mile of the LOD) are believed to pose the greatest risk to the LODs. Additionally, with the use of watershed-wide database searches, additional screening of PSOCs beyond 1/8th mile of the LOD was conducted to identify Resource Conservation and Recovery Act (RCRA)-Corrective Action sites, CERCLA Superfund sites, federal/state/Department of Defense (DoD) Facilities, Maryland Department of Environment (MDE) Land Restoration Program (LRP) sites, MDE Voluntary Cleanup Program (VCP) sites, and Brownfields sites, as well as gas stations and industrial facilities with known releases that would not have

been identified in the initial database search. A summary of PSOCs identified on or near each LOD is provided in the LOD-specific Project Area Site Descriptions screening reports for each LOD in Attachment 4.

2.2 Regulatory File Review

A PIA was submitted to MDE for additional records on PSOCs believed to have a high to moderate risk of impacting one of the LODs. Examples of PSOCs for which additional environmental regulatory documentation was requested include gas stations, properties with closed and/or open underground storage tanks (USTs)/aboveground storage tanks (ASTs), MDE Oil Control Program (OCP) sites, reported hazardous materials/petroleum spills, MDE LRP sites, MDE VCP sites, Brownfield sites, drycleaners, and industrial properties that currently store or historically stored substantial amounts of hazardous materials/wastes.

PIA requests for PSOC-specific regulatory information included, but were not limited to, soil and groundwater investigation summary reports, spill incident reports, tank removal closure reports, and storage tank registration information. PIA requests were submitted to MDE through multiple rounds of requests throughout the span of this project. Regulatory documentation that was subsequently provided by MDE and reviewed as part of this project is disseminated throughout this report and its attachments.

In addition to reviewing historical regulatory documentation and case files provided by MDE, available information on the MDE OCP's Case Information and Underground Storage Tank Facility Summary websites were reviewed for supplementary information on petroleum releases and USTs, and MDE's LRP Project Site Mapping online database was also reviewed in regard to any sites enrolled in MDE State Brownfield and VCP. Pertinent PSOC-specific information identified from MDE's online data sources is disseminated throughout this report and attachments.

2.3 Historical Imagery Review

Historical imagery sources, including aerial photographs, topographic maps, and Fire Insurance Maps (when available) were used to evaluate past and present land use activities within and in the vicinity of each LOD within the study area project corridor. Selected images, as well as summaries of the historical imagery review, are included in each LOD-specific Project Area Site Descriptions summary sheet in Attachment 4, as well as incorporated into the risk ranking rationale summaries for each LOD, provided in Section 3.2 - Evaluations of the Limit of Disturbances

2.4 Limitations

WSP identified the following limitations during this hazardous materials evaluation:

- The site reconnaissance of the LODs was not conducted during these hazardous materials evaluations; however, photographs and site reconnaissance summaries provided by other disciplines were reviewed to assist in understanding current conditions of the LODs.
- In some instances, historical resources (e.g., fire insurance maps) were unavailable for the LOD and surrounding area due to lack of coverage. Additionally, some of the aerial photographs were of poor quality. Based on these types of insufficient historical records, it may be difficult to determine an adequate history of the LOD and surrounding area.
- Regulatory documents that have been provided thus far by MDE were provided electronically, which left the decision on what was relevant to MDE personnel.
- Title records and environmental lien searches for the properties that the LODs were situated on were not reviewed.

3. Results

3.1 Ranking System

Based on the ranking system criteria provided below, all the identified LODs included in the I-495/I-270 Managed Lane Study (MLS) project are to be assigned a risk classification (i.e., high, moderate or low) based on the potential of environmental impacts being present within or in close proximity to the LOD.

High Risk:

- A REC is present within the LOD (e.g., USTs, ASTs, historical uses, etc.);
- Historical aerial imagery and maps indicate that ground-disturbing activities (e.g., excavations, landfilling) has occurred within the LOD (note: ground-disturbing activities associated with construction of roadways/sidewalks or residential/commercial structures is not considered a concern);
- The LOD is located on or within 300 feet hydraulically downgradient or less than 100 feet upgradient/cross-gradient of the following PSOCs:
 - An open or closed MDE OCP case(s) that has a documented release and cleanup associated with the case, but no other information available (requires a PIA request) or regulatory information indicates that the LOD has been impacted;
 - A closed VCP, LRP, or Superfund site; or Land-Use Controls (LUCs) have been imposed on the PSOC, but no other information available (requires a PIA request) or regulatory information indicates that the LOD has been impacted; or
 - The PSOC has multiple historical or active USTs with documented releases, but no other information available (requires a PIA request) or regulatory information indicates that the LOD has been impacted.
- A Hazardous Materials Information Resource System (HMIRS)/Maryland Spills Database (MDE SPILLS) incident involving a hazardous material/petroleum occurring within the LOD without information summarizing remediation efforts or clean-up or available information states that residual contamination is still present or could be potentially present within the LOD (requires a PIA request) or regulatory information indicates that the LOD has been impacted;
- The LOD is located on or abuts a PSOC that manages or disposes of regulated/hazardous waste/materials onsite with documented violations and has a high potential of impacting area within the LOD or regulatory information indicates that the LOD has been impacted.

Following review of MDE files obtained via a PIA request, if sufficient documentation was provided that confirms the LOD was either not impacted or impacts were addressed to regulatory standards, the LOD was reclassified to a low ranking. However, if the provided information was insufficient, the LOD remained classified at the high ranking.

Moderate Risk:

- Historical aerial imagery and maps indicate that ground-disturbing activities (e.g., excavations, landfilling) has occurred on land abutting the LOD (note: ground-disturbing activities associated with construction of roadways/sidewalks or residential/commercial structures is not considered a concern);
- The LOD is between 300 feet to 500 feet hydraulically downgradient or 100 feet to 200 feet hydraulically upgradient/cross-gradient of the following PSOCs:
 - An open or closed MDE OCP case(s) that has a documented release and cleanup associated with the case, but no other information available (requires a PIA request);
 - A closed VCP, LRP, or Superfund site; LUCs have been imposed on the PSOC, but no other information available (requires a PIA request); or

- The PSOC has multiple historical or active USTs with documented releases, but no other information available (requires a PIA request).
- A PSOC adjacent to the LOD has an active or closed AST or UST less than 550 gallons with no documented releases;
- The LOD is located within 100 feet of a PSOC that has multiple historical or operable USTs, but no records of spills or OCP cases;
- A HMIRS/MDE SPILLS incident involving hazardous material/petroleum product greater than 25 gallons occurred on the abutting property or within 50 feet of the LOD, without information summarizing remediation efforts or clean-up (requires a PIA request);
- The LOD is located on or abuts a RCRA-large quantity generator (LQG), small quantity generator (SQG) or conditionally exempt small quantity generator (CESQG) and/or very small quantity generator (VSQG) with documented violation notices (requires a PIA request).

Following review of MDE files obtained via a PIA request, if sufficient documentation was provided to support that impacts to the LOD do not exist, the LOD was reclassified to a low ranking. However, if the provided information was insufficient, the LOD remained classified at the moderate ranking.

Low Risk:

- The LOD and/or abutting properties have no history of contamination or spills;
- The LOD is less than 500 feet hydraulically downgradient or greater than 200 feet hydraulically upgradient/cross-gradient of a PSOC; however, substantial documentation on remedial efforts and effectiveness have determined the LOD was not impacted;
- The LOD is greater than 500 feet hydraulically downgradient or greater than 200 feet hydraulically upgradient/cross-gradient from any identified PSOCs;
- A HMIRS/MDE SPILLS incident involving hazardous material/petroleum product less than 25 gallons occurred greater than 50 feet of the LOD, without information summarizing remediation efforts or clean-up;
- Any REC or PSOC that would in any other instance be categorized as a high/moderate concern that is separated from the LOD by a body of water or stream;
- The LOD/abutting properties are currently or historically listed as a RCRA LQG, SQG, CESQG/VSQG, Non Generator (NON GEN) without documented violations or releases;
- A property is listed in a database that most likely would have no environmental impact on the LOD (e.g., national pollution discharge elimination system [NPDES], air permit [AIRS]);
- The LOD has undergone significant redevelopment as a non-petroleum/hazardous waste handling site;
- PSOC was found to be erroneously mislabeled or mapped.

When discernable, the distance from a REC (e.g., USTs) within a PSOC to the LOD was used in lieu of the distance from the PSOC boundary to the LOD.

Potential Sites of Concern (PSOCs):

- Industrial facilities;
- Service stations;
- Auto repair facilities;
- Commercial/State/County facilities maintenance yards;
- Automotive pools;
- Manufacturing facilities;
- Sites with petroleum/regulated substance-containing ASTs and USTs;
- Landfills (active/inactive);
- Sites with active/inactive remediation systems;

- Disposal pits and lagoons;
- Dry cleaners;
- Federal/State/County/Department of Defense (DoD) facilities; or
- PSOCs with documented land-use, engineering, or administrative controls.

3.2 Evaluations of the Limit of Disturbances

To document all the information gathered on each LOD, an LOD-specific Project Area Site Description summary sheet was created (Attachment 4). The LOD-specific summary sheet provides brief summaries of the current and historical uses of the surrounding area, and brief summaries of PSOCs identified in the environmental database records, as well as any regulatory information received and reviewed from MDE. Based on the probability of each PSOC to have impacted soil and groundwater within the boundaries of the LOD, each PSOC was then given a ranking of high, moderate, or low risk using the ranking system provided in Section 3.1. An overall ranking for each LOD of high, moderate, or low risk was then selected based on the highest ranking/rankings given to PSOCs within the vicinity of the LOD. Of the 739 SWM facility LOD sites evaluated, 640 LODs were classified as low risk, 71 as moderate risk, and 28 as high risk. All 15 stream restoration LODs were ranked as low risk.

3.2.1 High Risk Limit of Disturbances

Based on the review of available information for the LODs, 28 compensatory SWM facility LODs were categorized as having a high risk of impacted soil and/or groundwater within the limits of the LOD. LODs that are classified as high risk either have documented releases within their boundaries or are located within or adjacent to PSOCs with known environmental impacts and thus, have the greatest potential to be impacted by petroleum or other hazardous/regulated materials.

To further determine the impact of PSOCs which resulted in an LOD being categorized as having a high risk for environmental impacts, additional regulatory documentation on specific incidents/cases were requested from MDE. If an LOD is still categorized as high risk after a review of all pertinent information has been conducted, environmental investigations of subsurface materials, including, but not limited to, soil and groundwater sample collection and/or geophysical surveys, within the potential areas of disturbance may be required to characterize and quantify the impacts, to assist developing plans and protocols to protect worker safety, as well as the surrounding environment. See Attachment 1 for a table that lists all LODs categorized as high risk, along with a ranking rationale summary for each high risk LOD.

3.2.2 Moderate Risk Limit of Disturbances

Based on the review of available information for the LODs, 71 compensatory SWM facility LODs were categorized as having a moderate risk of impacted soil and/or groundwater within the limits of the LOD. An LOD was categorized as moderate risk when insufficient information was obtained to-date to make a clear risk determination of environmental impacts with that LOD, and environmental impacts cannot be completely ruled out.

For sites that were believed to have moderate to high probability of impacting the LOD, additional regulatory documentation on specific PSOCs was requested from MDE through PIA requests; however, in some cases, the requested files were not available for further review, as they either could not be located by MDE personnel or had been destroyed per MDE's file retention policy.

In certain cases, a precise LOD risk determination can only be made through field sampling. As an example, an underground petroleum pipeline is running north to south directly west of LOD WAS-4606. Sampling of subsurface material along the western boundary of the LOD is the only feasible option to determine whether or not the pipeline has impacted subsurface soils and/or groundwater within the

boundary of the LOD. See Attachment 2 for a table that lists all LODs categorized as moderate risk, along with a ranking rationale summary for each moderate risk LOD.

3.2.3 Low Risk Limit of Disturbances

Based on the review of available information for the LODs, 640 compensatory SWM facility LODs and all 15 of the stream restoration LODs were categorized as low risk. This low risk ranking means that it is unlikely that environmental impacts will be encountered within the LOD's limits. Low risk LODs are sites that either had no documented releases or prior releases at PSOCs within or in close proximity to the LOD were documented to be adequately remediated. See Attachment 3 for a table that lists all LODs categorized as low risk, along with a ranking rationale summary for each low risk LOD.

4. Conclusions

A total of 739 SWM facility LODs and 15 stream restoration LODs within the study area were reviewed from a hazardous materials standpoint and categorized as having either a high, moderate, or low risk of potential environmental impacts being encountered within the LOD. The ranking classifications were based on a review of an environmental database report, historical aerial/topographic maps, review of other disciplines' site reconnaissance findings, and a review of regulatory information and documents provided by regulatory agencies through PIA requests and their managed websites/online databases (when available).

Through this evaluation, 28 of the 739 SWM facility LODs were categorized as high risk. High Risk LODs are defined as LODs where releases have been documented within their boundaries or are located within or adjacent to PSOCs with known environmental impacts and thus, have the greatest potential to be impacted by petroleum or other hazardous/regulated materials.

A total of 71 SWM facility LODs within the study area have been categorized as moderate risk. Moderate risk sites are defined as sites where insufficient information has been obtained to-date to make a clear risk determination of environmental impacts within that LOD or site, and environmental impacts cannot be completely ruled out.

The remaining 640 SWM facility LODs and all 15 stream restoration LODs were categorized as low risk, meaning that either no PSOCs were identified in the vicinity of the LOD or PSOCs identified within the vicinity of the LOD either had no documented releases or prior releases were documented to be adequately remediated and/or were located a significant distance from the LOD where impacts to the LOD are unlikely.

Based on these findings, additional investigations are recommended to characterize soil and groundwater conditions within the LODs ranked as high or moderate risk. Proposed investigation should adequately characterize surficial and subsurface soils, as well as groundwater, if anticipated to be encountered. Sample locations should take into account locations of previous releases, former/current/ abandoned storage tanks, and inferred groundwater flow, as well as proposed soil/groundwater disturbance during construction. The laboratory analytical suite should be tailored to the contaminant(s) potentially present. Should contaminants be present at levels potentially indicative of hazardous waste, subsequent sampling utilizing Toxicity Characteristic Leaching Procedure (TCLP) is recommended.

ATTACHMENT D-1
High Risk LOD Table

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
PAX-0030	<p>The LOD is located along the south side of Central Avenue (MD 214), west of Campus Way, in Upper Marlboro, Maryland. A shopping center and active gas station are located to the south (upgradient) of the LOD and have been present since at least 1973. Residential neighborhoods are located to the north and east. Based on database report findings and information provided by MDE through a PIA request, known releases have occurred at the gas station that required, free product recovery, source removal actions, and active remediation both onsite, as well as on the eastern portion of the LOD. No analytical data associated with the concentrations of petroleum constituents identified within the boundaries of the LOD; however, it is possible that residual contamination is still present. A shopping center directly to the south (upgradient) previously had a dry cleaner that conducted dry cleaning onsite. A 1,000-gallon heating oil UST was removed from the dry cleaning facility in May 2000 that was found to have not impacted soil or groundwater; however, impacts to the LOD from the dry cleaning operations conducted at the site cannot be fully ruled out. Several other facilities were listed as having RCRA permits, and a 1,000-gallon heating oil UST was removed from the site in 2000 (no contamination found). Based on the documented releases associated with the gas station that is believed to have impacted the eastern portion of the LOD, as well as the potential for impacts from the former dry-cleaner south (upgradient) of the central portion of the LOD, further investigations are warranted to determine whether or not impacts from these two sites have impacted environmental media within the LOD.</p>
PAX-2017	<p>The LOD is located between Annapolis Road and the offramp from Annapolis Road (MD 45) onto Cipriano Road, in Lanham, Maryland. The surrounding area is primarily commercial developments with some residential complexes. Commercial and residential development is observed to begin prior to 1964. The surrounding area is observed in its current configuration by 1988. A site located approximately 85 feet north of the LOD formerly had a dry cleaning operation located onsite, as well as a gas station located directly northwest. Subsurface investigations identified elevated levels of chlorinated solvents and petroleum constituents/additives in soil and groundwater onsite. PCE was detected as high as 640 ug/l, TCE at 270 ug/l, cis-1,2-DCE at 98 ug/l, Vinyl Chloride at 140 ug/l. The site received NFRD in 2003, with land-use restrictions including use of groundwater onsite. Based on the local topography, groundwater is believed to flow to the southwest, potentially towards the LOD; therefore, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
PAX-2529	<p>The LOD is located along the south side of Laurel Fort Meade Road (MD 198), west of Red Clay Road, in Laurel, Maryland. The surrounding area is primarily developed with commercial properties with residential properties located further to the north and south. The area surrounding the LOD was primarily forested land up until 1970, when much of the area was cleared for commercial development. Commercial development and residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. There is a gas approximately 330 feet northeast of the LOD, as well as a second gas station approximately 425 feet to the east of the LOD. Both gas stations have reported releases to either soil and/or groundwater; however, based on the local topography, the facilities are believed to be either downgradient or crossgradient of the LOD. A shopping center, known as the Maryland City Plaza Shopping Center, is directly to the south of the LOD and portion of its parking lot is within the boundaries of the LOD. The shopping center previously had a drycleaner. Groundwater samples collected were found to have detected concentrations of chlorinated solvents that exceeded their respective MDE cleanup standards. Additional subsurface investigations performed at the property in 2004 indicated that the groundwater contamination plume did not impact off-site properties. In August 2004, the owners of the shopping center submitted a VCP application for the property seeking a NFRD as a responsible person. The NFRD issued on February 7, 2007 authorized use of the property for commercial/industrial purposes, imposed a groundwater use prohibition, required groundwater characterization prior to disposal, and use of a vapor barrier or additional subsurface testing for new building construction. Based on the local topography, the former drycleaner business is believed to be approximately 125 feet south (upgradient) of the western portion of the LOD; however, the land-use control area appears to either overlap or abut the entire southern third of the LOD. Thus, impacts to the LOD cannot be ruled out. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
PAX-2530	<p>The LOD is located along the south side of Laurel Fort Meade Road (MD 198), east of Old Annapolis Road, in Laurel, Maryland. The surrounding area is primarily developed with commercial properties with residential properties located further to the north and south. Commercial development, as well as residential development further to the north and south continued through 2005, when the surrounding area was observed to be developed in its current configuration. There is a gas approximately 395 feet northwest (downgradient) of the LOD. Four OCP cases have been opened at the site; however only one OCP case, opened in 2001 had a documented released and cleanup/ remediation was required. The case was closed approximately a year and a half later. A shopping center, known as the Maryland City Plaza Shopping Center, is directly to the south of the LOD and portion of its parking lot is within the boundaries of the LOD. The shopping center previously had a drycleaner. Groundwater samples collected were found to have detected concentrations of chlorinated solvents that exceeded their respective MDE cleanup standards. Additional subsurface investigations performed at the property in 2004 indicated that the groundwater contamination plume did not impact off-site properties. In August 2004, the owners of the shopping center submitted a VCP application for the property seeking a NFRD as a responsible person. The NFRD issued on February 7, 2007 authorized use of the property for commercial/industrial purposes, imposed a groundwater use prohibition, required groundwater characterization prior to disposal, and use of a vapor barrier or additional subsurface testing for new building construction. Based on the local topography, the former drycleaner business is believed to be approximately 85 feet south (upgradient) of the western portion of the LOD; however, the land-use control area appears to either overlap or abut the entire southern third of the LOD. Thus, impacts to the LOD cannot be ruled out. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
PAX-2531	<p>The LOD is located along the south side of Fort Meade Road (MD 198), west of Red Clay Road, in Laurel, Maryland. The surrounding area is primarily commercial properties, with residential properties further to the north and south. The area surrounding the LOD was primarily forested land up until 1970, when much of the area was cleared for commercial development. Commercial development, as well as residential development further to the north and south continued through 2005, when the surrounding area was observed to be developed in its current configuration. There is a gas approximately 85 feet southeast of the LOD, as well as a second gas station approximately 165 feet to the north of the LOD. Both gas stations have reported releases to either soil and/or groundwater. The gas station to the southeast is potentially upgradient of the eastern portion of the LOD. A shopping center, known as the Maryland City Plaza Shopping Center, is directly to the south of the LOD and portion of its parking lot is within the boundaries of the LOD. The shopping center previously had a drycleaner. Groundwater samples collected detected concentrations of chlorinated solvents that exceeded the MDE cleanup standards. Additional subsurface investigations performed at the property in 2004 indicated that the groundwater contamination plume did not impact off-site properties. In August 2004, the owners of the shopping center submitted a VCP application for the property seeking a NFRD as a responsible person. The NFRD issued on February 7, 2007 authorized use of the property for commercial/industrial purposes, imposed a groundwater use prohibition, required groundwater characterization prior to disposal, and use of a vapor barrier or additional subsurface testing for new building construction. Based on the local topography, the former drycleaner business is approximately 525 feet southwest (crossgradient) of the western portion of the LOD; however, the land-use control area appears to either overlap or abut the entire southern third of the LOD. Thus, impacts to the LOD cannot be ruled out. Further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>
PAX-2537	<p>The LOD is located in the central median of Patuxent Freeway (MD 32), east of Midway Branch overpass, in Fort Meade, Maryland. The surrounding area is undeveloped forested area to the south and military developments to the north. US Army Garrison Fort George G. Meade to the north has been a permanent Army installation since 1917. The area surrounding the LOD was previously forested land until 1993 when construction of Patuxent Highway was completed. The area surrounding the LOD has been observed in its current configuration since 2005. The LOD is located adjacent to the Fort George G. Meade Superfund site, which includes 24 Operable Units (OUs) where remedial investigations and remedy construction are currently underway. The LOD is located between the Patuxent Research Refuge – North Tract (PRR-NT) OU21 to the south and the Fort Meade Installation Area to the north. The portion of Fort Meade, directly north of the of the LOD includes the former salvage yard portion of the former Defense Property Disposal Office (DRMO OU5). This area was mainly used for storage and disposal of automobiles, drums, water heaters, heating units, dry cleaning machines, spent batteries transformers, pipe, and scrap metal. Soil tests conducted in 1995 found VOCs and SVOCs, PCBs, and metals were present. The site is contaminated with a large deep diffuse plume of PCE that extends for over 1 mile to the southeast. Based on the proximity of the site to the LOD, impacts to the LOD are considered to be high. Thus, further investigation may be warranted and/or coordination with Fort Meade DPW personnel prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
PAX-2538	<p>The LOD is located in the central median of Patuxent Freeway (MD 32), west of intersection of Pepper Road, in Fort Meade, Maryland. The surrounding area is undeveloped forested area to the south and military developments to the north. US Army Garrison Fort George G. Meade to the north has been a permanent Army installation onsite since 1917. The area surrounding the LOD was previously forested land until 1993 when construction of Patuxent Highway was completed. LOD ID	<p style="text-align: center;">High Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0319	<p>The LOD is located along the eastern side of Indian Head Highway (MD 210), in a median formed by the Indian Head Highway, Livingston Road and Indian Head Highway Service Road, in Oxon Hill, Maryland. The surrounding area is primarily commercial properties, which begin prior to 1959. The surrounding area is observed to be in its current configuration by 1988. The surrounding area includes two gas stations and several autobody shops. Several records of concern were identified in the surrounding area including OCP cases, USTs, and SPILLS. A former gas station is located approximately 70 feet southeast of the LOD. A PIA request was submitted to MDE for further information; however, no files related to the removal of the USTs was provided, only a summary of the USTs and their status. Two other gas stations are located approximately 225 feet northeast and northwest of the LOD. Both sites have had reported releases to soil and groundwater, as well as free product was identified at the gas station to the northwest. Based on the proximity of the current and former gas to stations with respect to the LOD, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-0328	<p>The LOD is located in the ROWs along Indian Head Highway (MD 210), between Southern Avenue SE and Audrey Lane, in Oxon Hill, Maryland. The surrounding area is a mix of residential and commercial developments. Commercial and residential development begin prior to 1949, and is observed in its current configuration by 2005. The surrounding area consists of two gas stations, two drycleaners and additional commercial buildings. Seventeen records of concern, all within 555 feet of the LOD, were listed on one or more environmental database. The facility with the greatest concern, a gas station located along the eastern side of the LOD, has documented petroleum impacts present in soil and groundwater beneath the site. Analytical data from investigations conducted in 2002 and 2003 indicate that most of the impacts are present in the north-central portion of the site; however, it is possible that impacts have migrated beneath the LOD. Another facility of concern, a former drycleaner located adjacent to the southern LOD extent, was listed as a RCRA-CESGQ database. No releases were reported, and a request for available records submitted to MDE was returned stating no files available. The remaining 15 sites are not expected to have impacted the LOD. Based on the documented releases associated with the gas station, and potential impacts from the former dry-cleaner, further investigation is warranted to determine whether or not impacts from these two sites have impacted environmental media within the LOD.</p>
WAS-2016	<p>The LOD is located in the center median of Greenbelt Road (MD 193), immediately west of the I-495 overpass, in Greenbelt, Maryland. The LOD is immediately surrounded by forest, with commercial and multifamily residential developments beyond. Several database listings at Greenbelt Road and I-495 were noted on the ERNS, OCP and RCRA LQG databases. The ERNS record, from 1992, was related to a discovery of oil in a drainage ditch, impacting water. The OCP case, opened in 1987 for unspecified purposes, but has since been closed. A PIA request was submitted to MDE for both the ERNS and OCP cases. Unfortunately, MDE stated that no files were available. Due to lack of information relating to these records, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-2032	<p>The LOD is located along the northern side of Queens Chapel Road (MD 500), northeast of Ager Road, in Hyattsville, Maryland. The surrounding area is primarily commercial developments. The Anacostia River runs east/west, south of the LOD. Development of the surrounding area is observed to begin prior to 1963, and is observed in its current configuration by 2005. Two gas stations were identified in close proximity to the LOD. One gas station, Mobil, is located within the southern portion of the LOD. The facility has four active and four historical USTs registered to it. A small release from a product line was discovered and addressed in 1981, as well as 550-gallon used oil UST was excavated and removed from the site in 1999. The site currently has one open OCP case. According to available information provided by MDE through a PIA request, in May 2019, an MDE inspector discovered gasoline in the sump system. The gasoline overflowed the sump and had impacted the subsurface material. Product thicknesses of 0.10 feet were identified in several of the tank field monitoring wells. MDE requested that a site investigation be conducted to determine the extent of the impacts. A proposed work plan was submitted in September 2020 that includes soil boring and groundwater sampling. The case is still pending and extent of the impacts are unknown at this point. The second gas station, Shell, is approximately 325 feet northeast of the LOD and is believed to slightly hydraulically crossgradient of the LOD. Currently, the site operates three USTs, ranging in size from 12,000 to 15,000 gallons. In 1998, Three monitoring wells were installed and sampled along with two existing monitoring wells in the tank field to determine if groundwater was impacted after a leak was detected in a dispenser and product drained through gravel trenches to the tank field and over 7,000-gallons of impacted water had been pumped out. The wells were sampled biannually. Analytical results from the last round of groundwater sampling, conducted in July 1998, detected concentrations of MTBE, TPH-GRO and total BTEX. Groundwater was determined to flow towards the southeast. In 2017, three 10,000-gallon USTs along with product lines and dispensers were excavated and removed from the site. Field screening from the tank field soil material using a photo-ionization detector (PID) recorded a maximum of 120 ppm in soils approximately 8 feet below grade surface (bgs). Impacted soils were removed from the tank field to a depth of approximately 16 feet bgs for the installation of new USTs. A total of 1,806.51 tons of petroleum impacted soil and 17,072 gallons of petroleum impacted water were removed for proper off-site disposal. Twenty soil samples were collected to evaluate the presence/absence of residual petroleum impact. The soil samples were analyzed for VOCs, naphthalene, and TPH-DRO/GRO. All soil sampling results were non-detect or below MDE's non-residential soil action levels. The case received closure from MDE approximately 3 months later. Based on the historical environmental issues at both of these gas stations, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">High Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2034	<p>The LOD is located along the southern side of Queens Chapel Road (MD 500), southwest of Hamilton Street, in Hyattsville, Maryland. The surrounding area is primarily commercial properties north of Queens Chapel Road, and forested land and the Anacostia River south of Queens Chapel Road. Development of the surrounding area began prior to 1963, and is observed in its current configuration by 2005. The area surrounding the LOD includes two dry cleaners, two gas stations and two former gas stations, two auto shops and several other commercial buildings with database listings. All but one listing either do not involve a release or were located at a sufficient distance from the LOD where impacts are unlikely. The lone exception is a Shell gas station located 70 feet northeast of the LOD and believed to upgradient of the LOD. Currently, the site operates three USTs, ranging in size from 12,000 to 15,000 gallons. In 1998, Three monitoring wells were installed and sampled along with two existing monitoring wells in the tank field to determine if groundwater was impacted after a leak was detected in a dispenser and product drained through gravel trenches to the tank field and over 7,000-gallons of impacted water had been pumped out. The wells were sampled biannually. Analytical results from the last round of groundwater sampling, conducted in July 1998, detected concentrations of MTBE, TPH-GRO and total BTEX. Groundwater was determined to flow towards the southeast. In 2017, three 10,000-gallon USTs along with product lines and dispensers were excavated and removed from the site. Field screening from the tank field soil material using a photo-ionization detector (PID) recorded a maximum of 120 ppm in soils approximately 8 feet below grade surface (bgs). Impacted soils were removed from the tank field to a depth of approximately 16 feet bgs for the installation of new USTs. A total of 1,806.51 tons of petroleum impacted soil and 17,072 gallons of petroleum impacted water were removed for proper off-site disposal. Twenty soil samples were collected to evaluate the presence/absence of residual petroleum impact. The soil samples were analyzed for VOCs, naphthalene, and TPH-DRO/GRO. All soil sampling results were non-detect or below MDE's non-residential soil action levels. The case received closure from MDE approximately 3 months later. Based on the proximity of this Shell gas station with known historical releases, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>
WAS-2039	<p>The LOD is located along Queens Chapel Road (MD 500), south of Manorwood Drive, in Hyattsville, Maryland. The western side of the LOD at the southern end extends further south along the western side of Queens Chapel Road. The surrounding area is primarily residential, which began prior to 1963. The surrounding area is observed to be in its current configuration by 1994. Two records of concern were identified that warrant further investigation prior to intrusive groundwater to determine if environmental media within the LOD have been impacted. The first record is an OCP case associated with a vehicle accident potentially occurring within the northern end of the LOD, which resulted in a release and subsequent cleanup. Additional records regarding this case were requested from MDE; however, MDE replied stating no records were available. The second record is an ERNS case, located 370 feet hydraulically upgradient from the LOD, where a heating oil AST leaked and impacted an area of soil approximately 5'x5' in size. The remaining fuel in the AST was pumped out, but no information was available regarding if or how the impacted soils were addressed. Additional records regarding this case were requested from MDE; however, MDE replied stating no records were available. Thus, impacts to the LOD cannot be ruled out. Further investigations are warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">High Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2059	<p>The LOD is located along the southern side of Chillum Drive (MD 501), east of Sargent Road, in Hyattsville, Maryland. The surrounding area is observed to be a mix of commercial and residential properties. Residential development began in the 1940s, and the surrounding area is observed in its current configuration by 2005. A former Voluntary Cleanup Program (VCP) site known as Sargent Road Shopping Center that formerly had a dry-cleaning company situated in the central portion of the shopping center is approximately 130 feet to the north/northwest of the LOD. According to available information found on MDE's LRP website, environmental investigations were conducted at the property 2006. The reports identified tetrachloroethene (PCE) in the soil and groundwater beneath the property, which may have resulted from dry cleaning operations, which occurred on site from 1963 to 2004. Woodmont Properties, Inc. submitted a VCP application package in June 2006 seeking a No Further Requirements Determination (NFRD), which MDE issued in December 2006, but with stipulations on use of the property, prohibition on the use of groundwater beneath the property, and requirements for a health and safety plan during future construction-related activities on the property. According to the environmental reports, groundwater flow direction beneath the property is to the south and southeast, towards the LOD. Thus, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-2067	<p>The LOD is located along the east side of Rhode Island Avenue (US Route 1), across from Braxton Place, in Hyattsville, Maryland. To the east of the LOD are railroad tracks and an industrial area dating from the 1960's. The general area consists of many automotive services, including body shops, repair shops and car sales. Outside the industrial area is residential development, some developed before 1900. To the south is undeveloped land surrounding the Northwest Branch of the Anacostia River. Nine sites had former and/or active USTs/ASTs, OCP cases or reported spill associated with them. Of these, the Koch Auto Radiator Service, located approximately 60 feet north (upgradient) of the LOD, had a 2,000-gallon gasoline UST installed in 1971 and removed at an unknown date. An OCP associated with the UST removal, and the site is also a RCRA small quantity generator with no record of violations. Based on the local topography, the site is believed to be upgradient of the LOD. A request for additional information was submitted to MDE, but MDE responded stating no files were available. Based on the limited information available on this site, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">High Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2068	<p>The LOD is located along the east side of Rhode Island Avenue, east of Braxton Place in Hyattsville, Maryland. To the east of the LOD are railroad tracks and an industrial area dating from the 1960's. The general area consists of many automotive services, including body shops, repair shops and car sales. Outside the industrial area is residential development, some developed before 1900. To the south is undeveloped land surrounding the Northwest Branch of the Anacostia River. Twenty-five sites were identified in the environmental database report around the LOD. Thirteen of the sites had former and/or active USTs/ASTs, OCP cases, or reported spill associated with them. Three sites with a total of five OCP cases associated with the removal of over 15 USTs are located within 150 feet upgradient of the LOD that included Marche & Co at 4800 Rhode Island Ave; Demers Real Estate and Mills Radiator Shop at 4802 Rhode Island Ave, and Demers Real Estate and 82 Brewing at 4822-4824 Rhode Island Ave. Based on available data provided by MDE through a PIA request, substantial source removal of petroleum impacted soils was performed at these sites, that showed through confirmation sampling that the majority of the impacted material had been removed; however, groundwater sampling or off-site soil sampling is believed to have been conducted. Since the LOD is downgradient of these sites, impacts cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-2072	<p>The LOD is located on the east side of Baltimore Avenue (US Route 1), south of Longfellow Street, in Hyattsville, Maryland. The surrounding area is residential with commercial some properties, especially further east of the LOD. The surrounding area was developed by the 1900's, and was originally residential, becoming commercial in the 1960's, and then again redeveloped as mostly multi-family residential in the 2000's. The surrounding area was observed in its current configuration by 2015. Twenty sites listed on one or more environmental databases were identified within 600 feet of the LOD. Eighteen of the sites have registered active and former UST/AST, OCP cases, and reported spills, five of which are located within 180 feet of the LOD. In addition, a dry cleaner is located adjacent to the LOD, although it was not listed in any environmental database. Based on the number of active and former petroleum USTs/ASTs, OCP cases, and reported spills, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">High Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2531	<p>The LOD lies along the western side of Powder Mill Road (MD 212), north of Beltsville Drive, in Beltsville Maryland. The surrounding area is primarily commercial properties. Prior to commercial development in 1971, the area was entirely forested land. The surrounding the LOD was observed in its current configuration by 2005. A gas station is located directly northwest (upgradient) of the LOD that has four active petroleum USTs ranging in size from 8,000-gallons to 12,000-gallons and one former 1,000-gallon used oil UST. In 1998, four hydraulic vehicle lifts were removed from the site, as well as retrofitting the onsite USTs, product piping, and dispenser islands. Approximately 135 tons of soil from the dispenser island trenches was excavated and disposed of offsite. In 2000, a petroleum release from one of the regular gasoline USTs was reported. Four monitoring wells were installed around the tank area. No free product was ever observed, but the March 2001 groundwater sampling results identified dissolved BTEX concentrations as high as 12,205 µg/l in the central portion of the site. The case received closure from MDE in August 2001. Groundwater at the site is believed to flow southeast, towards the LOD. Additionally, an MDE VCP site known as the Calverton Shopping Center is located to the west of the LOD. Dry-cleaning operations have resulted in chlorinated solvent impacts to soil and groundwater. The site is believed to be crossgradient of the LOD; however, impacts cannot be ruled out based on a lack of information on the exact location of the impacts. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-2532	<p>The LOD lies along the western side of Powder Mill Road (MD 212), north of Beltsville Drive, in Beltsville Maryland. The surrounding area is primarily commercial properties. Prior to commercial development in 1971, the area was entirely forested land. The surrounding the LOD was observed in its current configuration by 2005. A gas station located adjacent to the southwest has four active petroleum USTs ranging in size from 8,000-gallons to 12,000-gallons and one former 1,000-gallon used oil UST. In 1998, four hydraulic vehicle lifts were removed from the site, as well as retrofitting the onsite USTs, product piping, and dispenser islands. Approximately 135 tons of soil from the dispenser island trenches was excavated and disposed of offsite. In 2000, a petroleum release from one of the regular gasoline USTs was reported. Four monitoring wells were installed around the tank area. No free product was ever observed, but the March 2001 groundwater sampling results identified dissolved BTEX concentrations as high as 12,205 µg/l in the central portion of the site. The case received closure from MDE in August 2001. Although MDE closed the OCP case, impacted groundwater may remain which could have migrated beneath the LOD. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	High Risk LOD Table Ranking Rationales
WAS-2565	<p>The LOD is along Baltimore Avenue (US Route 1) and St. Mary's Street in Beltsville, Maryland. The surrounding area is developed with commercial and retail businesses with residential areas to the north. Commercial development began in the 1940s and continued through the 1980s when the surrounding area was observed in its current configuration. Fourteen sites listed on one or more environmental databases were identified in the surrounding area. Of these, the most concerning include an MDE VCP site and an active gas station. The VCP site with LUC is located immediately across Baltimore Avenue. Based on a review of MDE files obtained through a PIA request, a No Further Requirements Determination (NFRD) has been issued for the site, which prohibits residential use of the property and also imposes groundwater restrictions due to residual contamination. The gas station is located adjacent to the south. This gas station has been in operation since 1982 and has several closed OCP cases, as well as an open OCP case, relating to tank test failures. In addition, a public complaint was made in 2014 of leaking pumps. Due to the proximity of this facility (adjacent), impacts to the LOD cannot be ruled out. Based on the proximity of these sites to the LOD, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-2571	<p>The LOD is along the western side of Baltimore Avenue (US Route 1), north of Garrett Avenue, in Beltsville, Maryland. The surrounding area was forested and rural residential in the 1940s. Additional residential development occurred through the 1970s, followed by commercial development to the east. Additional commercial development occurred through the early 1980s when the surrounding area was observed in its current configuration. Seventeen sites listed on one or more environmental database were identified in the surrounding area. The most concerning is an activate gas station with known releases that the LOD potentially located within. Based on a review of MDE files obtained via a PIA request, residual on-site soil contamination is present at the gas station and a gasoline spill occurred as recently as March 2021. In addition, a dry-cleaning facility is located approximately 65 feet upgradient from the LOD. No files were available from MDE via a PIA request. As the LOD is either adjacent to or within an active gas station site with known impacts, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	<p style="text-align: center;">High Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3609	<p>The LOD is located on the west side of Georgia Avenue (MD 79), south of Thistlebridge Drive, in Rockville, Maryland. The surrounding area is a mix of residential and commercial properties. Residential development is observed to begin prior to 1959, while commercial development began in the 1960s, which continued through 2005, when the surrounding area was observed to be developed in its current configuration. Two sites of concern were identified in the environmental database report. The first site, a hardware/former service station approximately 190 feet south (downgradient) of the LOD, previously had 11 petroleum USTs ranging in size from 110-gallons to 550-gallon removed. In November 1989, six soil samples were collected in the vicinity of two 550-gallon gasoline USTs near the south end of the site in order to evaluate potential petroleum contamination. Noticeable petroleum odors were noted in the field during the investigation. Soil samples were analyzed for TPH and BTEX which confirmed the presence of soil contamination near the tanks as well as along the south edge of the property, which may be due to an off-site source, potentially a gas station further to the south. In November 1995, two 290-gallon motor oil tanks, two 110-gallon motor oil USTs, two 550-gallon gasoline USTs and one 280-gallon kerosene UST were excavated and removed were excavated and removed from the site. PID readings from the excavation ranged from 10 and 500 ppm. No free product was encountered and the on-site MDE inspector approved backfilling of the excavation. No further work was required. Based on the information summarized above and the absence of any post-excavation analytical data to indicate otherwise, it is possible that residual concentrations of petroleum constituents could be encountered within the limits of the LOD. The second site of significant concern, an automotive sales business and tire repair shop located approximately 70 feet west (downgradient) of LOD. In 1991, a 275-gallon kerosene UST was excavated and removed from the site. Upon removal, one perforation was discovered at the top of the tank. A petroleum odor was observed; therefore, soil was excavated from several feet below the depth of the tank and a PID reading of below 50 ppm was recorded. The onsite MDE inspector granted permission to backfill the excavation site. Based on the information summarized above and the absence of any post-excavation analytical data to indicate otherwise, it is possible that residual concentrations of petroleum constituents could be encountered within the limits of the LOD. Thus, further investigation may be warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-3611	<p>The LOD is located along the west side of Georgia Avenue (MD 97), south of Norbeck Road (MD 28), in Rockville, Maryland. The LOD has remained vacant land since the 1950s based on available aerial imagery. The surrounding area is a mix of residential and commercial properties. Residential development is observed to begin prior to 1959. Commercial developments to the north are observed to begin in the 1960s. Development continued through 2013, when the surrounding area was observed to be developed in its current configuration. A gas station is located 145 feet north (upgradient) of the LOD with four USTs currently on the site and eleven former USTs. The facility currently has an open OCP case related to elevated levels of TPH-DRO/GRO and VOCs present in soil and groundwater both on and offsite of the facility. In 2014, three 10,000-gallon petroleum USTs were excavated and removed from the site, along with approximately 1,000 tons of impacted soil. Confirmation samples and groundwater samples collected from the excavation, soil borings, and temporary groundwater monitoring wells revealed elevated levels of several petroleum constituents above MDE's non-residential cleanup levels. Subsequently, eight permanent monitoring wells were installed across the site and continue to be sampled quarterly to present day. According to the analytical data from January 2019 quarterly sampling report for the monitoring well (MW1) closest to the LOD, 145 feet to the northwest (upgradient), detected concentrations of benzene (4,300 ug/l), ethylbenzene (2,310 ug/l), MTBE (661 ug/l), naphthalene (570 ug/l), toluene (15,100 ug/l), Xylenes (5,410 ug/l), THP-GRO (24.0 mg/l) and TPH-DRO (5.35 mg/l) all greatly exceed their corresponding MDE regulatory action levels. The groundwater plume is not drawn beyond the boundaries of the site; however, based on the current plume boundaries and that the LOD is hydraulically downgradient of the site, there is a high probability that groundwater and possibly soils within the LOD are impacted. Further investigations are believed to be warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	<p style="text-align: center;">High Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3616	<p>The LOD is located on vacant/maintained ROW, west of Georgia Avenue (MD 97), north of Norbeck Road (MD 28), in Rockville, Maryland. The surrounding area is a mix of residential and commercial properties. Residential development is observed to begin prior to 1959. Commercial development is observed to begin in the 1960s. Development in the surrounding area continued through 2005, when the surrounding area is observed to be developed in its current configuration. The first site, a hardware/former service station approximately 75 feet south (downgradient) of the LOD, previously had 11 petroleum USTs ranging in size from 110-gallons to 550-gallon removed. In November 1989, six soil samples were collected in the vicinity of two 550-gallon gasoline USTs near the south end of the site in order to evaluate potential petroleum contamination. Noticeable petroleum odors were noted in the field during the investigation. Soil samples were analyzed for TPH and BTEX which confirmed the presence of soil contamination near the tanks as well as along the south edge of the property, which may be due to an off-site source. It was the owner's position that the contamination was primarily due to an Exxon station formerly located in the current location of Route 28. There were no additional MDE records indicating how the soil contamination was addressed. In November 1995, two 290-gallon motor oil tanks, two 110-gallon motor oil USTs, two 550-gallon gasoline USTs and one 280-gallon kerosene UST were excavated and removed were excavated and removed from the site. PID readings from the excavation ranged from 10 and 500 ppm. No free product was encountered and the on-site MDE inspector approved backfilling of the excavation. No free product was encountered and the on-site MDE inspector approved backfilling of the excavation. No further work was required. Based on the information summarized above and the absence of any post-excavation analytical data to indicate otherwise, it is possible that residual concentrations of petroleum constituents could be encountered within the limits of the LOD. The second site of significant concern, an automotive sales business and tire repair shop located directly north (crossgradient) of LOD, has one closed OCP case that was opened in February 1991 and closed April 1992. Based on the information provided by MDE, a 275-gallon kerosene UST was removed on 2/28/91. The tank was approximately 40 years old and had not been used for 20 years. Upon removal, one perforation was discovered at the top of the tank. Soil screening identified a very light odor in the soil; therefore, soil was excavated from several feet below the depth of the tank and PID readings at that depth were under 50 ppm. The onsite MDE inspector granted permission to backfill the excavation site. Based on the information summarized above and the absence of any post-excavation analytical data to indicate otherwise it is possible that residual concentrations of petroleum constituents could be encountered within the limits of the LOD. Thus, further investigation may be warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-4075	<p>The LOD is located southeast of Clopper Road and Liberty Mill Road in Germantown, Maryland. The LOD is located on private property as well as travel lanes for both roadways. The LOD is surrounded by undeveloped land to the west and south and commercial property to the east and north. Based on review of historical aerial and topographic maps, Germantown Road and Clopper Road have been present since 1944. A structure that appears to be a gas station is observed on the LOD between the 1970s and early 1990s. No further information was identified associated with this former property. The surrounding area was observed to be developed in its current configuration around 2005. Seven environmental database listings were identified in the immediate area of the LOD. That includes gas stations, a drycleaner, and a fire station. All the sites are believed to be crossgradient or downgradient of the LOD with the exception of an Exxon/Sunoco gas station approximately 130 feet north of the LOD. The site currently has four active 8,000 to 10,000 gallon gasoline and diesel USTs, and five permanently out-of-use USTs that were removed from ground. In 1998, one 10,000-gallon and two 8,000-gallon gasoline USTs were excavated and removed from the site. PID readings ranged from 400 to 1248 ppm. Approximately 400 tons of impacted soil was excavated and removed from the site. One 10,000-gallon and two 8,000-gallon gasoline USTs were installed in-place of the previous USTs. The case was closed in 2002. In 2011, a 1,000-gallon used oil UST was excavated and removed from the site. PID readings from the bottom of the excavation were 0.0 ppm. Two soil samples were collected and analyzed for TPH-DRO (329 mg/kg and 2,280 mg/kg)/GRO (1.17 mg/kg and 35 mg/kg) and VOCs including detections of TCE (12 ug/kg), naphthalene (1,020 ug/kg) and Xylenes (9.1 ug/kg). Based on the results for the confirmation sampling the case was closed approximately 2 months later. No groundwater sampling data for the site was identified during this review. Based on the lack of information on the former structure presumed to be a gas station from the 1960s to early 1990s, as well as gas station directly upgradient of the LOD with known residual soil impacts, impacts to the LOD cannot be ruled out. Further investigations are warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-4632	<p>The LOD is located along the north side of River Road (MD 190), directly west of Lake Potomac Drive, in Potomac Maryland. The surrounding area is semi-rural/suburban area Residential properties built between 1981 and 1988 on moderate size lot are to the north, east, west. The WSSC Potomac Filtration Plant is located approximately 200 feet south of the LOD, built prior to 1959 and has been expanded multiple times. There have been 27 reported spills that range in size from 1 gallon to an unknown amount, ranging from wastewater to water treatment chemicals. There are 7 USTs registered at the property, 6 of which are permanently out of use and 1 currently in use. Based on local topography, the LOD is potentially downgradient from the site. Based on a review of MDE files provided through a PIA request, five 20,000-gallon ferric chloride USTs were excavated and removed for off-site disposal in 1994. No corrective action was required based on site observation and analytical data, and MDE closed case #94-2858 MO-2. Other records reviewed included a spill report for the release of 2 gallons of oil inside a container in 2017, as well as several third party UST inspections and associated MDE correspondence. Based on the lack of documentation related to the closure of the 1,000-gallon gasoline UST, as well the majority of the spills at the facility, the facility's proximity, and its potential upgradient proximity relative to the LOD, there is a potential for impacts to the LOD.</p>

LOD ID	<div>High Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-4652	<p>The LOD is located to the north of the intersection of River Road (MD 190) and Persimmons Tree Road, in Rockville, Maryland. The surrounding area is primarily residential with some commercial development in the surrounding area. Residential development is observed to begin by 1964 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. There have been three OCP cases and two SPILLS cases in the surrounding area. One OCP case, abutting the LOD, was opened during a residential heating oil tank closure approximately 85 feet south of the LOD. The UST along with approximately 24 tons of impacted soil were excavated from the site and disposed of at a regulated facility. Two confirmation samples were collected from the excavation and analyzed for TPH-DRO/GRO and VOCs. Detected concentrations of naphthalene (42.7mg/kg) and TPH-DRO (9,800 mg/kg) in the sample collected from the western end of the excavation, exceeded MDE's corresponding soil cleanup standards of 3.8 mg/kg (naphthalene) and 230 mg/kg (TPH-DRO), respectively. MDE allowed for the remaining impacted soil to be left in-place and the case was closed. The second case is associated with a residential property approximately 40 feet to 175 feet northwest of the LOD. The case is related to a leaking heating oil UST that was leaching oil into the basement of the residence in 1990. The UST was removed and over 1,000 gallons of petroleum impacted groundwater were collected and disposed offsite from 1991 to 1992. The case was closed after air samples were collected from the basement indicated that risk was present. No analytical data or information pertaining to efforts to characterize subsurface soil and groundwater were provided in the files reviewed; therefore, residual concentrations of petroleum constituents could be present on the property, as well as within the boundaries LOD, as the site is believed to be upgradient. Based on in the information summarized above of these two sites in close proximity to the LOD, further investigation maybe warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

ATTACHMENT D-2
Moderate Risk LOD Table

LOD ID	Moderate Risk LOD Table Ranking Rationales
PAX-2541	<p>The LOD lies along the central median Fort Meade Road (MD 198), west of Brock Bridge Road, in Laurel, Maryland. The area surrounding the LOD is primarily commercial properties. Based on historical imagery, development did not begin until the 1960s. Prior to then the area was mostly cleared agricultural land. Commercial development of the surrounding area continued until approximately 2017, when the area was observed in its current configuration. Seven sites with OCP cases, former and active UST cases, and spill incidents identified near the LOD. All but one are either downgradient, crossgradient, or far enough away that they are not believed to impact the LOD. One site located approximately 195 feet to the east, potentially upgradient of the LOD is an active gas station with one 12,000-gal gasohol UST, and two 10,000-gal gasohol USTs currently onsite. In 1991, two 6,000-gal Gasoline USTs, one 8000-gal Gasoline USTs, one 10,000 gasoline UST, and one 4,000-gal Gasoline UST were excavated and removed from the site. Four soil samples were collected from 2 feet below the USTs and analyzed for benzene (7 to 170 ug/kg), toluene (2 to 1,200 ug/kg), ethylbenzene (10 to 450 ug/kg), xylenes 36 to 6,100 ug/kg), naphthalene (non-detect), and MTBE (non-detect). In 2004, a case was opened related to groundwater contamination and is still open; however, the file was not provided by MDE for review. Thus, impacts to the LOD cannot be ruled out. Further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>
PAX-2542	<p>The LOD lies along the central median of Fort Meade Road (MD 198), west of Brock Bridge Road, in Laurel, Maryland. The area surrounding the LOD is primarily commercial properties. Development of commercial properties did not begin until the 1960s. Prior to then the area was mostly cleared agricultural land. Commercial development of the surrounding area continued until approximately 2017. There are seven sites with OCP cases, former and active UST cases, and spill incidents located near the LOD. All but one is either downgradient, crossgradient, or far enough away that they are not believed to impact the LOD. One site located approximately 60 feet to the south, potentially upgradient of the LOD is an active gas station with one 12,000-gal gasohol UST, and two 10,000-gal gasohol USTs currently onsite. In 1991, two 6,000-gal Gasoline USTs, one 8000-gal Gasoline USTs, one 10,000 gasoline UST, and one 4,000-gal Gasoline UST were excavated and removed from the site. Four soil samples were collected from 2 feet below the USTs and analyzed for benzene (7 to 170 ug/kg), toluene (2 to 1,200 ug/kg), ethylbenzene (10 to 450 ug/kg), xylenes 36 to 6,100 ug/kg), naphthalene (non-detect), and MTBE (non-detect). In 2004, a case was opened related to groundwater contamination and is still open. A PIA request was submitted to be MDE for further information on the case; however, the file was not provided by MDE for review. Thus, impacts to the LOD cannot be ruled out. Further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
PAX-3005	<p>The LOD is located along the western side of Sykesville Road (MD 32), south of Old Frederick Road (MD 199), in Sykesville, Maryland. The surrounding area is a mix of rural agricultural land, commercial and residential developments. Commercial and residential development began around 1982, and the surrounding area is observed in its current configuration by 2009. A SPILLS record, associated with an overturned fertilizer tanker truck in 2013, resulted in a diesel fuel release. A remediation contractor was hired to clean up the spill, who pumped the remaining diesel fuel from the damaged saddle tank, used absorbent dust and pads to address the released fuel. A request was submitted to MDE for further information on this incident; however, MDE was unable to identify any files. Thus, impacts to the LOD cannot be ruled out. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
PAX-3021	<p>The LOD is located along the northern side of the Baltimore National Pike (I-70/US Route 40), at a truck weigh station, in Sykesville, Maryland. The surrounding area is primarily agricultural land, which started prior to 1959, along with some forested land and residential developments to the north and east. The surrounding area is observed in its current configuration by 1995. In 2016, an incident involving a tractor trailer truck resulted in an estimated release of 50 gallons of diesel from a damaged saddle tank. Dam and diking were used to contain the release which was cleaned up using absorbent dust. As the release may have occurred within the LOD, a PIA request was submitted to MDE for this SPILLS incident, but MDE stated that no files were available. Due to lack of information relating to this record, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
PAX-4006	<p>The LOD is located northeast of the intersection of Pennsylvania Avenue (MD 4) and Westphalia Road, in Upper Marlboro, Maryland. The area surrounding the LOD is densely developed with commercial properties. The area was mostly cleared agricultural land until the 1970s when development began to the east of the LOD. Residential properties surrounding the LOD were cleared for commercial development. Development continued through 2017. Several sites with active and former USTs, OCP cases, documented spills were identified in the immediate vicinity of the LOD; however, most appear to far enough hydraulically crossgradient or downgradient of the LOD, with the exception of a gas station located approximately 100 feet north of the LOD that has two 10,000-gal gasohol, and one 10,000-gal diesel (installed in 1984). PIA request was submitted to MDE for further information on the site. One OCP case was opened in 1984 for the installation of the USTs and not due to a release. A second OCP was opened in 1989 and closed on an unknown date. MDE stated the file had been destroyed per their file retention policies. The available information did not state whether a release had occurred or not. In 2020, the facility's environmental contractor reported the discovery of petroleum contaminated soils underneath all the dispensers onsite; however, no other information was provided. Based on the local topography, the site is believed to be upgradient of the LOD. Thus, impacts to the LOD cannot be ruled out. Further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-0084	<p>The LOD is located along Landover Road (MD 202), west of John Hanson Highway (US Route 50), in Hyattsville, Maryland. The surrounding area is mixed-use residential/commercial. Commercial and residential properties are to the north, south and west, while primarily commercial properties are to the east, beyond the interchange with John Hanson Highway. Residential development began in the 1940's/1950's, while commercial development began in the 1960's, approximately about the same time as when the John Hanson Highway and interchange with Landover Road was observed to have been completed (1963). The surrounding area was observed to be developed in its current configuration around 1981. An active drycleaner is located approximately 65 feet north of the LOD (upgradient). There are no reported violations associated with the cleaners; however, the facility is located immediately upgradient of the LOD and thus remains a concern. Several other sites/incidents are located within 575 feet of the LOD; however, based on the either the spill incident, type of records (e.g. air permit, RCRA NON GEN, etc.) or hydraulic direction (cross/downgradient) from the LOD, impacts to the LOD are unlikely. A request was submitted to MDE for further information on the dry cleaner; however, MDE was unable to identify any files. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-0301	<p>The LOD is located along the south side of Central Avenue (MD 322), between Quire Avenue and Suffolk Avenue, in Capitol Heights, Maryland. The surrounding area is mixed-use residential / commercial. Residential development occurred prior to the 1960s, with commercial development starting in the 1960s. By 1994, the surrounding area was observed in its current configuration. A US Post Office facility located adjacent to the south (upgradient), which the LOD may partially reside in, was flagged as being on the UST and OCP databases. Two former 6,000-gallon gasoline USTs were excavated, one each in 1990 and 1998. A total of four OCP cases have been opened, with the 1998 UST removal case stating a release had occurred. A PIA request was submitted to MDE; however, files for three of the OCP cases have been destroyed per MDE's file retention protocols. Files for the lone OCP case, from July 1996, stated that approximately 10-gallons of gasoline was released when an employee drove a vehicle away from the onsite refueling station while the dispenser hose was still attached to the vehicle. The gasoline was contained and cleaned up by the facility's contractor, and the case was closed. While this release incident would unlikely impact the LOD, information pertaining to the other three OCP cases, especially the case where subsurface impacts were identified, was unavailable. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-0302	<p>The LOD is located along the southern side of Central Avenue (MD 214), at merger with Old Central Avenue (MD 322), in Capitol Heights, Maryland. Portions of the LOD extend north, across Central Avenue, as well as south, across Old Central Avenue. The surrounding area is mixed-use residential and commercial. Residential development started prior to the 1960's, but increased in the 1970's along with commercial development to the north, east, and west. The surrounding area was observed similar to its current configuration by 1989. Several records of concern were identified in the area, the most concerning is a gas station located directly north of the LOD, which the LOD extends up to. This gas station currently has two 12,000-gallon and one 15,000-gallon petroleum USTs present onsite. In addition, in 1998, a 1,000-gallon used oil UST was excavated and removed from the site; however, OCP files pertaining to this case have been destroyed per MDE's file retention protocols. The used oil UST most likely was located adjacent to the structure on the site, approximately 90 feet north of the LOD. In 2014, three former gasoline USTs along with ancillary piping and dispenser islands were excavated, along with 1,490 tons of petroleum impacted soils. A total of 18 confirmation soil samples were collected from the exaction and analyzed for BTEX, naphthalene, and TPH-DRO/GRO, all which were all below their respective MDE non-residential cleanup standard. Based on the analytical data subsurface soil on the site does not appear to be grossly impacted; however, gasoline-impacted soils and groundwater may still remain. Further, information was not available regarding the former used oil UST. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-0626	<p>The LOD is located along the south side of Fort Washington Road, west of Indian Head Highway (MD 210), in Fort Washington, Maryland. The surrounding area is primarily commercial properties. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the north and continued through 1988, when the surrounding area was observed in its current configuration. Two gas stations and a former drycleaner are located between 70 feet and 605 feet north/northwest of the LOD. The Exxon gas station located approximately 70 feet north (upgradient) of the LOD has a history of environmental issues. Based on information provided by MDE, a 1,000-gallon used oil UST, a 1,000-gallon heating oil UST and three hydraulic lifts were excavated/removed from the facility in 1996. Approximately 539 tons of impacted soil was excavated and removed from the site, most coming from around the hydraulic lifts and used oil UST. Soil samples identified isolated impacts around the former hydraulic lifts. MDE requested that three monitoring wells be advanced at the site and analyzed for petroleum constituents. Based on the results of the investigation, groundwater impacts were detected primarily in the southern portion of the site, as well as lower detections in the northwestern portion of the site. Based on a groundwater elevation survey, the hydraulic gradient is to the southwest (towards the LOD). The case received closure from MDE in 1998. The gas station 195 feet to the northwest, as well as the former drycleaner approximately 605 feet to the north are believed to be crossgradient of the of the LOD. Based on the upgradient location of the Exxon gas station, approximately 70 feet to the north of the LOD, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0627	<p>The LOD is located along the west side of Indian Head Highway (MD 210), southwest of the intersection with Fort Washington Road, in Fort Washington, Maryland. The surrounding area is primarily commercial properties. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the north and continued through 1988, when the surrounding area was observed in its current configuration. Two gas stations are located at 170 feet and 350 feet north/northwest of the LOD, respectively. The Exxon gas station that is located approximately 170 feet north (upgradient) of the LOD has a history of environmental issues. Based on information provided by MDE, a 1,000-gallon used oil UST, a 1,000-gallon heating oil UST and three hydraulic lifts were excavated / removed from the facility in 1996. Approximately 539 tons of impacted soil was excavated and removed from the site, most coming from around the hydraulic lifts and used oil UST. Soil samples identified isolated impacts around the former hydraulic lifts. MDE requested that three monitoring wells be advanced at the site and analyzed for petroleum constituents. Based on the results of the investigation, groundwater impacts were detected primarily in the southern portion of the site, as well as lower detections in the northwestern portion of the site. Based on a groundwater elevation survey, the hydraulic gradient is to the southwest (towards the LOD). The case received closure from MDE in 1998. The gas station 350 feet to the northwest is believed to be crossgradient of the of the LOD. Based on the upgradient location of the Exxon gas station, approximately 170 feet to the north of the LOD, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-0628	<p>The LOD is located along the west side of Indian Head Highway (MD 210), south of Fort Washington Road, in Fort Washington, Maryland. The surrounding area is primarily commercial properties. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the north and continued through 1988, when the surrounding area was observed in its current configuration. Two gas stations are located at 275 feet and 435 feet north/northwest of the LOD, respectively. The Exxon gas station that is located approximately 275 feet north (upgradient) of the LOD has a history of environmental issues. Based on information provided by MDE, a 1,000-gallon used oil UST, a 1,000-gallon heating oil UST and three hydraulic lifts were excavated / removed from the facility in 1996. Approximately 539 tons of impacted soil was excavated and removed from the site, most coming from around the hydraulic lifts and used oil UST. Soil samples identified isolated impacts around the former hydraulic lifts. MDE requested that three monitoring wells be advanced at the site and analyzed for petroleum constituents. Based on the results of the investigation, groundwater impacts were detected primarily in the southern portion of the site, as well as lower detections in the northwestern portion of the site. Based on a groundwater elevation survey, the hydraulic gradient is to the southwest (towards the LOD). The case received closure from MDE in 1998. The gas station 350 feet to the northwest is believed to be crossgradient of the of the LOD. Based on the upgradient location of the Exxon gas station, approximately 275 feet to the north of the LOD, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-0644	<p>The LOD is located along the northern side of Woodyard Road (MD 223), between Denton Drive and Keppel Place, in Clinton, Maryland. The western end of the LOD extends south, across Woodyard Road. The surrounding area is comprised of commercial and residential properties with forested areas. Tanglewood Community Park is located north of to the LOD, a Verizon Store to the east, and commercial stores and a shopping center to the southwest. The area was primarily agricultural and forested area in 1949. Residential development began by 1963 while commercial development began in the 1970s. The surrounding area was observed to be developed in its current configuration in 2005. The Verizon Communications property, located approximately 25 feet east-northeast of the LOD, was listed as having one active 4,000-diesely UST and one former 2,000-gallon kerosene UST. The 2,000-gallon kerosene UST, which was excavated and removed from the site in 1992, was observed to be in good condition; however, impacted soil was encountered as PID readings were recorded as 1,000 ppm in the excavation. A total of 68 tons of petroleum-impacted soil was disposed of offsite, the excavation backfilled and the case was closed in September 1993. In 1994, the 4,000-gallon diesel UST was installed in approximately the same location as the prior 2,000-gallon UST. Based on the proximity of the soil impacts identified during removal of the 2,000-gallon UST, impacts to the LOD cannot be completely ruled out. Thus, further investigation is warranted to determine if any subsurface impacts are present within the boundary of the LOD.</p>
WAS-0937	<p>The LOD is located between Indian Head Highway (MD 210) and Hickory Knoll Road, north of Livingston Road, in Accokeek, Maryland. The surrounding area is observed to be commercial properties to the south and east. Forested land to the west and further to the south. The area was primarily forested land up until the late 1990s when commercial development began to the east and west. Development continued through 2005, when the surrounding area was observed in its current configuration. Two gas stations, an MDE VCP site and a drycleaner are located in the immediate vicinity of the LOD. The gas station, located approximately 200 feet southwest of the LOD and potentially upgradient, was found to have impacted soil and groundwater to the north, west, and south of the site in 1999. The vacant Accokeek property, located north of the gas station and approximately 65 feet west of the LOD, entered into the MDE VCP program in 2010 after petroleum impacts were identified through environmental investigations conducted by the landowner in 2009. The OCP case for the gas station received closure in 2009, and the vacant VCP property to the north received a no further action determination in 2011. Files pertaining to the site characterization of the property stated that groundwater is believed to flow to the northwest (crossgradient) of the LOD. Furthermore, there is an active gas station and drycleaner facility located approximately 305 and 200 feet to the east of the LOD, respectively. No additional data was available on releases on these sites; however, these facilities are located upgradient of the LOD. Due to the known soil and groundwater impacts near the LOD, and the potential for other impacts, further investigation is warranted to determine if any subsurface impacts are present within the boundary of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-0979	<p>The LOD is located along the central median of Branch Avenue (MD 5), south of Short Cut Road, in Brandywine, Maryland. The surrounding area is composed of commercial properties and forested land. The surrounding area was primarily rural agricultural and forested land up until 1970, when a storage yard to the east and commercial development to the north were observed. Residential development to the northwest began in the 2000s and the area was observed in its current configuration by 2018. The adjacent trailer storage yard, which was previously a junk yard from the 1960s through approximately 1990, had a 4,000-gallon diesel UST and a 6,000-gallon gasoline UST removed in 1990. A request for additional information on these USTs was submitted to MDE, but no files were available. A gas station located 310 feet north currently has four existing USTs, including an 8,000-gallon and 10,000-gallon gasoline USTs, a 10,000-gallon diesel UST and an 8,000-gallon kerosene UST. In addition, five 4,000-gallon USTs, two 1,000-gallon USTs and one 550-gallon UST were excavated and removed in 1997. During removal of the former USTs, impacted soil was identified resulting in the excavation of over 2,480 tons of impacted soil. After the impacted material was removed, the four existing USTs were installed. Based on data provided by MDE, no soil or groundwater sampling data was available. Based on the lack of information relating to former USTs previously present at the adjacent trailer yard and nearby gasoline station, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-0984	<p>The LOD is located along the central median of Branch Avenue (MD 5), south of Moores Road, in Brandywine, Maryland. A gas station constructed in approximately 2019 is west of the LOD; an open field and residential properties is to the east; forested land is located to the south; and commercial properties and forested land are located to the north. The surrounding area was observed to be primarily forested and agricultural land up until the 1970s, when residential development began to occur to the east. Residential and commercial development continued through the late 2010s, when the surrounding area was observed to be developed in its current configuration. The gas station has had no reported spills/releases since its construction in 2019; therefore, impacts to the LOD from this property are unlikely. A commercial vehicle accident occurred at the intersection of Branch Avenue and Moores Road directly north of the LOD in 2004, which resulted in a release requiring cleanup efforts. A request for additional information was submitted to MDE, who responded stating no files were available. Due to lack of information relating to this record, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-0985	<p>The LOD is located along the central median of Branch Avenue (MD 5), north of Moores Road, in Brandywine, Maryland. Forested land and a water tower are located to the north of the LOD; a gas station, open field, residential properties and forested land to the south; forested land and residential properties to the east; and commercial properties and forested land to the west. The surrounding area was observed to be primarily forested and agricultural land up until the 1970s, when residential development began to the east. Residential and commercial development continued through the late 2010s, when the surrounding area was observed to be developed in its current configuration. The gas station approximately 350 feet downgradient of the LOD has had no reported spills/releases since its construction in 2019; therefore, impacts to the LOD from this property are unlikely. An OCP case related to dumping was opened on a property approximately 150 feet to the west; however, records stated that no release was identified and thus, cleanup/remediation was not required. A commercial vehicle accident occurred at the intersection of Branch Avenue and Moores Road directly south of the LOD in 2004, which resulted in a release requiring cleanup efforts. A request for additional information was submitted to MDE, who responded stating no files were available. Due to lack of information relating to this record, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-0995	<p>The LOD is located between Indian Head Highway (MD 210) and Jennifer Drive, north of Livingston Road, in Accokeek, Maryland. The surrounding area has commercial properties to the south, east, and southwest, and forested land to the west and further to the south. The area was primarily forested land up until the 1980s when commercial development began to the east and southwest. Development continued through 2005, when the surrounding area was observed in its current configuration. Two gas stations, an MDE VCP site and a drycleaner are located in the immediate vicinity of the LOD. In 1999, the gas station to the west was found to have impacted soil and groundwater to the west, northwest and southwest of the LOD. The vacant Accokeek property, located north of the gas station and approximately 65 feet west of the LOD, entered into the MDE VCP program in 2010 after petroleum impacts were identified through environmental investigations conducted by the landowner in 2009. The OCP case for the gas station received closure in 2009, and the vacant VCP property to the north received a no further action determination in 2011. Files pertaining to the site characterization of the property stated that groundwater is believed to flow to the northwest (crossgradient) of the LOD. Based on available data impacts from the gas station to the west are not believed to have impacted the LOD. However, there is an Exxon gas station and a former drycleaner located approximately 70 feet and 120 feet east of LOD, respectively. The gas station currently has two active 15,000-gallon gasohol USTs, and a 12,000-gallon diesel UST (fiberglass) that were installed in 1998. OCP cases for this site include a case that was opened for the installation of the USTs, as well as a case related to dumping. The gas station to the south was also found to have an OCP case relating to dumping where a release was reported and cleanup activities occurred. The drycleaners to the east of the LOD was issued a Notice of Violation; however, no further information was available. Due to the known soil and groundwater impacts near the LOD, and the potential for other impacts, further investigation is warranted to determine if any subsurface impacts are present within the boundary of the LOD.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-1000	<p>The LOD is located within the southwest portion of the Cheltenham Youth Detention Center, north of Surratts Road, in Cheltenham, Maryland. The detention center spans towards the northeast and includes multiple structures on a large open campus. Forested land is observed in all directions, and a cemetery is observed further to the southeast. The detention center was present since at least 1960. The large structure directly north/northwest of the LOD was constructed sometime between the late 1980s and early 1990s. The facility has 26 closed heating oil, diesel, and gasoline USTs ranging in size from 500 to 6,000 gallons. There are twelve OCP cases associated with this facility. A PIA request was submitted to MDE to review the available information; however, only nine of the twelve case reports were provided as the other three had been destroyed per MDE's file retention policy. Based on the available case files, the majority of the USTs previously removed had impacted soil and/or groundwater beneath them. Furthermore, the exact locations of the USTs were not adequately documented and many of the site location figures that were provided in the case files were hand drawn and not to scale. Currently there is a 5,000-gallon petroleum AST located approximately 75 feet north of the LOD, which most likely has taken the place of a former UST that was located in the general vicinity. Due to lack of information relating to these records, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD has been impacted.</p>
WAS-1001	<p>The LOD is located within the south-central portion of the Cheltenham Youth Detention Center, north of Surratts Road, in Cheltenham, Maryland. The detention center spans both to the southwest and northeast of the LOD and includes multiple structures on a large open campus. A pond is observed south of the LOD. A cemetery is observed further to the southeast. The detention center was present since at least 1960. The large structure was constructed in central portion of the LOD in approximately 1988. Another large structure directly southwest of the LOD was constructed sometime between the late 1980s and early 1990s. The facility has 26 closed heating oil, diesel, and gasoline USTs ranging in size from 500 to 6,000 gallons. There are twelve OCP cases associated with this facility. A PIA request was submitted to MDE to review the available information; however, only nine of the twelve case reports were provided as the other three had been destroyed per MDE's file retention policy. Based on a review of the available case files, the majority of the USTs removed from the facility had impacted soil and/or groundwater beneath them. In addition, the exact locations of the USTs were not adequately documented and many of the site location figures that were provided in the case files were hand drawn and not to scale. It is believed that each structure on the site had at least one petroleum UST associated with them. The USTs were likely installed next to each of the historical buildings; therefore, there is a possibility that one or more USTs were previously located within the boundaries of the LOD. Due to lack of information relating to these records, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD has been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-1002	<p>The LOD is located within the central portion of the Cheltenham Youth Detention Center, north of Surratts Road, in Cheltenham, Maryland. The detention center spans both to the south, east, and north of the LOD and includes multiple structures on a large open campus. A pond is observed south of the LOD, a cemetery further to the southeast, and residential properties further to the east. The detention center was present since at least 1960. The large structure was constructed southwest of the LOD in approximately 1988. No substantial changes to LOD or immediate area around the LOD were observed after 1988. The facility has 26 closed heating oil, diesel, and gasoline USTs ranging in size from 500 to 6,000 gallons. There are twelve OCP cases associated with this facility. A PIA request was submitted to MDE to review the available information; however, only nine of the twelve case reports were provided as the other three had been destroyed per MDE's file retention policy. Based on a review of the available case files, the majority of the USTs removed from the facility had impacted soil and/or groundwater beneath them. In addition, the exact locations of the USTs were not adequately documented and many of the site location figures that were provided in the case files were hand drawn and not to scale. It is believed that each structure on the site had at least one petroleum UST associated with them. The USTs were likely installed next to each of the historical buildings; therefore, there is a possibility that one or more USTs were previously located within the boundaries of the LOD. Due to lack of information relating to these records, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD has been impacted.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2012	<p>The LOD is located along west side of Edmonston Road (MD 201), immediately north of Cherrywood Lane, in Greenbelt, Maryland. The area surrounding the LOD consists of agricultural lands and forest. Commercial and residential development is present to the west, southeast, and south, which occurred primarily between the 1960s and 1990s. The U.S. District Courthouse, located approximately 536 feet southeast of the LOD, previously had two USTs excavated and removed in November 2015. No releases were identified in association with these USTs. The LOD is located within the boundaries of Beltsville Agricultural Research Center (BARC), which was listed as a CERCLA "Superfund" site in 1994. The BARC facility dates to 1910 when USDA purchased a 475-acre farm to conduct research on animal husbandry, dairying, and animal diseases. Additional land was purchased over the next few years to expand the research facility, which ultimately grew to encompass approximately 12,000 acres. BARC was historically divided into five separate administrative units known as "Farms." These units are specifically identified as North, South, Linkage, Central, and East Farms. Based on a review of aerial photographs and available maps, the LOD is located within the boundary of the Linkage farm and directly south of the South Farm, north of Edmonston Road. USDA-ARS is currently performing a full range of site screening, restoration, and monitoring activities, consistent with requirements stipulated in a Federal Facilities Agreement (FFA). CERCLA response activities have been concluded or are underway at several higher priority areas of concern (AOCs). The FFA initially identified a total of 166 AOCs for further evaluation; however, this was later reduced to 59 AOCs for investigation as part of the CERCLA site screening process. Based on review of available information on the US EPA's and USDA's website pertaining to the BARC NPL, two AOCs are between 1,000 feet and 1,200 feet to the north of the LOD, including BARC 8 –Animal Parasitology Unit (APU) Waste Dump (BARC 8) and EPIC 21 - Open Storage Environmental Photographic Interpretation Center [EPIC] 21. Both sites were investigated and characterized and received no further action determinations from EPA. Based on the information obtained for these two sites, impacts are believed to be isolated to areas approximately 1,000 to 1,200 feet north of the LOD and are unlikely to impact the LOD. However, since the area has been utilized as an agricultural research facility since the 1910s, there is a likelihood that organochlorine pesticides, such as dieldrin, DDT, chlordane, and lindane may be present in soils and sediments within the boundary of the LOD. Further information is warranted, including coordination with USDA and US EPA, prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2033	<p>The LOD is located along Queens Chapel Road (MD 500), southwest of Hamilton Street, in Hyattsville, Maryland. The surrounding area is primarily commercial properties north of Queens Chapel Road, and forested land and the Anacostia River south of Queens Chapel Road. Development of the surrounding began prior to 1963, and appears in its current configuration by 2005. The area surrounding the LOD includes two dry cleaners, two gas stations and two former gas stations, two auto shops and several other commercial buildings with database listings. All but one listing either do not involve a release or were located at a sufficient distance from the LOD where impacts are unlikely. The lone exception is a Shell gas station located approximately 145 feet to the northeast which is believed to slightly hydraulically crossgradient of the LOD. Currently, the site operates three USTs, ranging in size from 12,000 to 15,000 gallons. In 1998, Three monitoring wells were installed and sampled along with two existing monitoring wells in the tank field to determine if groundwater was impacted after a leak was detected in a dispenser and product drained through gravel trenches to the tank field and over 7,000-gallons of impacted water had been pumped out. The wells were sampled biannually. Analytical results from the last round of groundwater sampling, conducted in July 1998, detected concentrations of MTBE, TPH-GRO and total BTEX. Groundwater was determined to flow towards the southeast. In 2017, three 10,000-gallon USTs along with product lines and dispensers were excavated and removed from the site. Field screening from the tank field soil material using a photo-ionization detector (PID) recorded a maximum of 120 ppm in soils approximately 8 feet below grade surface (bgs). Impacted soils were removed from the tank field to a depth of approximately 16 feet bgs for the installation of new USTs. A total of 1,806.51 tons of petroleum impacted soil and 17,072 gallons of petroleum impacted water were removed for proper off-site disposal. Twenty soil samples were collected to evaluate the presence/absence of residual petroleum impact. The soil samples were analyzed for VOCs, naphthalene, and TPH-DRO/GRO. All soil sampling results were non-detect or below MDE's non-residential soil action levels. The case received closure from MDE approximately 3 months later. Based on the proximity of this Shell gas station with known historical releases, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>
WAS-2040	<p>The LOD is located along Queens Chapel Road (MD 500), between Nicholson Street and Manorwood Drive, in Hyattsville, Maryland. The surrounding area is primarily residential, which began prior to 1963. The surrounding area is observed to be in its current configuration by 1994. Two records of concern were identified that warrant further investigation prior to intrusive groundwater to determine if environmental media within the LOD have been impacted. The first record is an OCP case associated with a vehicle accident near the southern end of the LOD, which resulted in a release and subsequent cleanup. Additional records regarding this case were requested from MDE; however, MDE replied stating no records were available. The second record is an ERNS case, located 165 feet hydraulically upgradient from the LOD, where a heating oil AST leaked and impacted an area of soil approximately 5'x5' in size. The remaining fuel in the AST was pumped out, but no information was available regarding if or how the impacted soils were addressed. Additional records regarding this case were requested from MDE; however, MDE replied stating no records were available. Thus, impacts to the LOD cannot be ruled out. Further investigations may be warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2041	<p>The LOD is located along Queens Chapel Road (MD 500), between Nicholson Street and Oglethorpe Drive, in Hyattsville, Maryland. The southern end of the LOD extends further east, away from Queens Chapel Road. The surrounding area is primarily residential, which began prior to 1963 and is observed in its current configuration by 1994. One records of concern, an OCP case located 105 feet from the LOD, was identified that warrants further investigation prior to intrusive groundwork to determine if environmental media within the LOD have been impacted. This record involved a leaking heating oil AST which impacted an area of soil approximately 5'x5' in size. The remaining fuel in the AST was reportedly pumped out, but no information was available regarding if or how the impacted soils were addressed. The remaining records are unlikely to have an impact on the LOD based on their distance or hydraulic directions.</p>
WAS-2044	<p>The LOD is located primarily within a center median of Queens Chapel Road (MD 500), immediately southwest of East West Highway (MD-410). Portions of the LOD near the center extend east and west, across Queens Chapel Road. The surrounding area is a mix of commercial and residential developments. Development of the surrounding area is observed to begin prior to 1963, and is viewed in its current configuration by 2017. Six facilities listed on one or more environmental databases were identified. Of these, all but one facility was located at a distance of 455 feet or greater from the LOD. The lone exception, an OCP case, was located adjacent to the southeast side of the LOD. This OCP case was opened in 1991 for unknown reasons. It is also unknown whether a release occurred; however, the case was closed within a week. A request to MDE for additional information was returned stating no files were available. Due to the proximity of this OCP case, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-2048	<p>The LOD is located along the central median of the Kenilworth Avenue (MD 201), at 48th Street, in Bladensburg, Maryland. The surrounding area is a mix of industrial and commercial; a self-storage facility and auto repair shop are located to the east, and an industrial area with several warehouses and outdoor storage to the west. Commercial development took place mostly by 1960, the self-storage facility was built in the 1970's. Twenty-nine sites were identified in the environmental database in the vicinity of the LOD. Of those sites identified, twenty of them had former/active USTs, OCP cases, or reported releases. It is believed that the majority of the sites are either crossgradient/ downgradient of the LOD or at a sufficient distance where impacts to the LOD are unlikely. One site, Ernest Maier Inc., is directly west of the LOD and had two former USTs, one 10,000-gallon diesel #2 UST closed in-place in 1991 and one 20,000-gallon diesel #2 UST excavated and removed from the site in 2007. Based on available data, PID readings from the bottom of the excavation of the 20,000-gallon diesel #2 UST ranged from 200 to 523 ppm. An unknown amount of impacted soil was excavated and disposed of offsite. A soil sample was collected approximately 2 to 3 feet below the former UST at each end. TPH-DRO was detected at 38 mg/kg and 64 mg/kg. There are no records of sampling soil or groundwater with the UST closed in-place, as well as the exact locations of the former USTs on the site are unknown. Due to the limited information available on this adjacent site, impacts to the LOD cannot be ruled out. Therefore, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2050	<p>The LOD is located on the northern side of Annapolis Road (MD 450), in 71st Avenue's center median, in Hyattsville, Maryland. The LOD is surrounded by residential development to the north, east and west. A gas station is located south of the LOD, directly across Annapolis Road. In 2003, a sheen was observed in a groundwater collected from a monitoring well. MDE requested that a Phase II investigation be conducted to determine the extent of the impacted area at the gas station. Five soil borings/monitoring wells were installed and sampled. Free product was observed in the northeast portion of the site. Additional soil boring/groundwater samples were collected from four points surrounding the monitoring wells, with no additional free product encountered. Based on the result of the investigation, it was concluded that impacted material was believed to be isolated to the property; however, groundwater flow was inferred to flow to the north, towards the LOD, and impacted groundwater could have potentially migrated into boundaries of the LOD since 2004. Additionally, a drycleaner is located approximately 265 feet southwest (potentially upgradient) of the LOD. A request was submitted to MDE for further information on the drycleaner; however, MDE was unable to identify any files. Based on the upgradient proximity of the gas station with known historical environmental issues and a drycleaner, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>
WAS-2051	<p>The LOD is located along the central median of Annapolis Road (MD 450), east of 71st Avenue, in Hyattsville, Maryland. The LOD is mostly surrounded with residential development, with a Catholic school located south of the eastern portion of the LOD and some commercial development further to the west. Development of the area began in the 1940s to 1960s timeframe and continued through 2008, when the surrounding area was observed in its current configuration. An OCP case was opened in July 1998 at a restaurant facility approximately 50 feet south of the LOD. According to available records a petroleum release of unknown volume occurred that was addressed/cleaned-up, and the case was closed approximately 3 weeks later. There are no records of any UST being registered to this restaurant facility. A PIA request was submitted to MDE for the OCP case. Unfortunately, MDE stated that no files were available. Due to lack of information relating to this release, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2069	<p>The LOD is located on the eastern side of Rhode Island Avenue (US Route 1), north of 43rd Avenue, in Hyattsville, Maryland. A railroad runs parallel with Rhode Island Avenue on the east side. The surrounding area is mostly commercial, much of it developed by 1900. Several government and institutional buildings are located west and north of the LOD, which were built in the late 1980s/early 1990s. Thirty-four sites in the surrounding area were listed on one or more environmental database. Of those identified sites, twenty-two had former and/or active USTs/ASTs, OCP cases, or reported spills associated with them. The most concerning, a Prince George's County government center located directly northwest (upgradient) of the LOD, had nine historic USTs along with one currently in-use UST. The historic USTs include gasoline, diesel and heating oil tanks ranging in size from 500-gallons to 12,000-gallons. Closure assessment information was only available for one former UST, a 500-gallon gasoline UST. Gasoline from this UST apparently migrated beneath an adjacent parking garage where it was captured and accumulated in an oil/water separator associated with a parking garage. In addition, elevated petroleum vapors were documented on multiple levels of the parking garage. Due to high concentrations of petroleum vapors present, a vapor recovery system was installed and ambient air monitoring was initiated. A total 4-gallons of free product was recovered from a monitoring well near the 500-gallon gasoline UST. Based on known historical impacts at the site, hydraulic direction from the LOD (upgradient) and the lack of information regarding closure of eight of the nine historical USTs, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>
WAS-2070	<p>The LOD is located on the east side of Rhode Island Avenue (US Route 1), between 43rd Avenue and Farragut Street, in Hyattsville, Maryland. The area surrounding the LOD is mostly commercial, much of it developed by 1900. Several government and institutional buildings are located west and north of the LOD, which were built in the late 1980s/early 1990s. Thirty-three sites in the surrounding area were listed on one or more environmental database. Of those identified sites, twenty-two had former and/or active USTs/ASTs, OCP cases, or reported spills associated with them. The most concerning, a Prince George's County government center located directly northwest (upgradient) of the LOD, had nine historic USTs along with one currently in-use UST. The historic USTs include gasoline, diesel and heating oil tanks ranging in size from 500-gallons to 12,000-gallons. Closure assessment information was only available for one former UST, a 500-gallon gasoline UST. Gasoline from this UST apparently migrated beneath an adjacent parking garage where it was captured and accumulated in an oil/water separator associated with a parking garage. In addition, elevated petroleum vapors were documented on multiple levels of the parking garage. Due to high concentrations of petroleum vapors present, a vapor recovery system was installed and ambient air monitoring was initiated. A total 4-gallons of free product was recovered from a monitoring well near the 500-gallon gasoline UST. Based on known historical impacts at the site, hydraulic direction from the LOD (upgradient) and the lack of information regarding closure of eight of the nine historical USTs, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2071	<p>The LOD is located on the east side of Rhode Island Avenue (US Route 1), approximately 35 feet south of Farragut Street, in Hyattsville, Maryland. The area surrounding the LOD is mostly commercial, much of it developed by 1900. Several government/institutional buildings are located southwest of the LOD, these were built in the late 1980's/early 1990's. Twenty-six sites were identified in the environmental database report around the LOD. Of those identified sites, eighteen had former and/or active USTs/ASTs, OCP cases, or reported spill associated with them. Three of these sites warrant further investigation prior to intrusive groundwater to determine if environmental media within the LOD have been impacted. These sites include the Machen Property (ERIS Site ID 5/8) located 185 feet from the LOD, the Prince George's County government center (ERIS Site ID 9/13) located across Rhode Island Avenue, and the Valley Typesetting Inc. site (ERIS Site ID 14/17) located 375 feet from the LOD. Each of these involved former USTs that were found to have leaked during tank removal activities. Minimal information was available on the Machen Property sites, other than two OCP cases were assigned, both stating a release and cleanup activities occurred. A PIA request was submitted to MDE for further information; however, the MDE stated that the files had been destroyed per their file retention policy. The Prince George's County government center had nine historic USTs along with one currently in-use UST. The historic USTs include gasoline, diesel and heating oil tanks ranging in size from 500-gallons to 12,000-gallons. Closure information was only available for the 500-gallon gasoline UST. Released gasoline was identified in an oil/water separator associated with an adjacent parking garage, which also had a vapor recovery system installed due to the buildup of vapors beneath it. The Valley Typesetting site had two historic USTs, a 550-gallon diesel and a 550-gallon gasoline tank, both removed in 2012. During UST removal activities, perforations were observed in both tanks, and soil screening with a PID identified readings up to 1,000 ppm. Approximately 20 tons of impacted soils and 229 gallons of impacted liquids were removed from the excavation pit. Confirmatory soil sampling results were below regulatory levels. Based on this, MDE closed out the OCP case. Although MDE closed the OCP case, MDE did not require any groundwater sampling, which may have been impacted. The Machen Property and the Valley Typesetting sites appear to be located upgradient of the LOD, while the Prince George's County government center is located adjacent to the LOD. Based on the lack of information regarding eight of the nine former USTs associated with the adjacent Prince George's County government center, as well as the two upgradient properties with documented releases, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2074	<p>The LOD is located along the south side of Annapolis Road (MD 450), south of Riverdale Road, in New Carrollton, Maryland. The surrounding area is primarily commercial developments, which began prior to 1964, and is observed in its current configuration by 2017. The area surrounding the LOD includes a dry cleaner, an auto repair shop and three gas stations. Based on the local topography most of the sites are believed to be downgradient of the LOD, with the exception of the Merchants Tire Store located approximately 45 feet southwest of the LOD. This facility had a 550-gallon used oil UST excavated and removed and oil/water separator abandoned in-place approximately 100 feet south of the LOD in 1991. According to available information, numerous perforations were observed on the UST and impacted soil was observed in the excavation. PID readings from the bottom of the excavation ranged from 6.2 to 99 ppm. Based on the PID readings, the MDE inspector believed that impacts were not substantial and instructed the contractor to backfill the excavation without requiring any soil and/or groundwater sampling. The case was recommended for closure shortly thereafter; however, the case was not officially closed until 1999. Based on its proximity to the LOD and lack of sampling data, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-2528	<p>The LOD lies along the southern side of Powder Mill Road (MD 212), east of Beltsville Drive, in Beltsville Maryland. The area surrounding the LOD is primarily commercial properties. Prior to development of commercial properties in 1971, the area was entirely forested land. The area surrounding the LOD was observed in its current configuration by 2005. There are five sites with active and/or inactive UST with documented releases and OCP cases within 410 feet to 650 feet downgradient of the LOD. An MDE VCP site, Calverton Shopping Center, is located approximately 280 feet north (upgradient) of the LOD. According to available records found on MDE's LRP website, the site is a commercial strip shopping center that houses an active drycleaner. A Phase I Environmental Site Assessment was completed in March 2012, followed by a Phase II Environmental Site Investigation which collected samples next to the dry cleaner. Analysis of the groundwater samples revealed volatile organic compounds above the department's cleanup standards. Per a 2/24/2017 letter, the Department approved proposed groundwater sampling on an annual schedule and restricted to PCE and its breakdown products. Per a letter from February 2019, MDE stated that groundwater sampling may be discontinued. Based on available information, impacts from the former drycleaner appeared to be isolated to the site, located approximately 280 feet upgradient of the LOD. A PIA request was submitted to MDE for further information on the site; however, MDE did not have any files available at the time of this review. Based on the drycleaner's upgradient direction, impacts cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2529	<p>The LOD lies along Powder Mill Road (MD 212), east of Beltsville Drive, in Beltsville Maryland. The LOD initially runs along the northern side of Powder Mill Road, but then turns and crosses Powder Mill Road. The area surrounding the LOD is primarily commercial properties. Prior to the development of commercial properties in 1971, the area was entirely forested land. The surrounding the LOD was observed in its current condition by 2005. There are nine sites with active and inactive UST with document releases within 300 feet to 745 feet downgradient of the LOD. An MDE VCP site, Calverton Shopping Center, is located approximately 10 feet north (upgradient) of the LOD. According to available records found on MDE's LRP website, the site is a commercial strip shopping center that houses an active drycleaner. A Phase I Environmental Site Assessment was completed in March 2012, followed by a Phase II Environmental Site Investigation which collected samples next to the dry cleaner. Analysis of the groundwater samples revealed volatile organic compounds above the department's cleanup standards. Per a 2/24/2017 letter, the Department approved proposed groundwater sampling on an annual schedule and restricted to PCE and its breakdown products. Per a letter from February 2019, MDE stated that groundwater sampling may be discontinued. Based on available information, impacts from the former drycleaner appeared to be isolated to the site, located approximately 165 feet upgradient of the LOD. A PIA request was submitted to MDE for further information on the site; however, MDE did not have any files available at the time of this review. Based on the drycleaner's distance and upgradient direction, impacts cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-2530	<p>The LOD lies along the eastern side of Powder Mill Road (MD 212), north of Beltsville Drive, in Beltsville Maryland. The surrounding area is primarily commercial properties. Prior to commercial development in 1971, the area was entirely forested land. The surrounding area was observed in its current configuration by 2005. There are nine sites with active and inactive USTs with document releases within 285 feet to 655 feet down Calverton Shopping Center, is located approximately 10 feet north (upgradient) of the LOD. According to available records found on MDE's LRP website, the site is a commercial strip shopping center that houses an active drycleaner. A Phase I Environmental Site Assessment was completed in March 2012, followed by a Phase II Environmental Site Investigation which collected samples next to the dry cleaner. Analysis of the groundwater samples revealed volatile organic compounds above the department's cleanup standards. Per a 2/24/2017 letter, the Department approved proposed groundwater sampling on an annual schedule and restricted to PCE and its breakdown products. Per a letter from February 2019, MDE stated that groundwater sampling may be discontinued. Based on available information, impacts from the former drycleaner appeared to be isolated to the site, located approximately 280 feet upgradient of the LOD. A PIA request was submitted to MDE for further information on the site; however, MDE did not have any files available at the time of this review. Based on the drycleaner's upgradient direction, impacts cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2539	<p>The LOD is along the eastern side of Baltimore Avenue (US Route 1), northeast of Circle Drive, in Beltsville, Maryland. The surrounding area was observed to be developed with commercial and retail businesses beginning in the 1940s. This type of development continued in the immediate area up until 1981, when the surrounding area was observed in its current configuration. Several sites in close proximity to the LOD have reported releases and/or former USTS, including a nearby active gas station 160 feet east and former gas station 75 feet northwest, and two dry cleaners (one active, one inactive) within an adjacent shopping center to the north with historical subsurface chlorinated solvent contamination. The former gas station, currently an AutoZone, previously had three 10,000-gallon gasoline USTs excavated and removed in 2011. PID readings from the soils excavated, as well as soil below the grade of the former UST was screen with a PID, were non-detect. Soil sample were collected, which did not indicate any substantial subsurface impacts. A Phase II site assessment by the current owner identified gasoline-impacted soil and groundwater near the former tank field, but samples collected closest to the LOD were non-detect, indicating the impacts were localized to the former tank field. Based on this, impacts to the LOD from this gas station is unlikely. The WaWa gas station approximately 160 feet to the southeast was constructed around 2010 and has four 15,000-gallon gasoline USTs. Previously, another gas station was situated on the site up until 1999 and had 3 gasoline USTs ranging in size from 2,000- to 3,000-gallons. No records were identified with the previous gas station that was located at the site. Due to the lack of information on this former gas station, as well as its distance from the LOD, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-2555	<p>The LOD is located along the southern side of the south-bound I-95 onramp from in Beltsville, Maryland. The surrounding area is primarily commercial, with I-95 is located to the east. The area was primarily vacant forested land up until the late 1960s/early 1970s when I-95 was constructed. Four sites listed on one or more environmental database were identified in the surrounding area. Of these, the most concerning is a gas station located 180 feet to the northwest. This active gas station has four active petroleum USTs ranging in size from 8,000-gallons to 12,000-gallons and one former 1,000-gallon used oil UST. In 1998, four hydraulic vehicle lifts were removed from the site, as well as retrofitting the onsite USTs, product piping, and dispenser islands. Approximately 135 tons of soil from the dispenser island trenches was excavated and disposed of offsite. In 2000, a petroleum release from one of the regular gasoline USTs was reported. Four monitoring wells were installed around the tank area. No free product was ever observed, but the March 2001 groundwater sampling results identified dissolved BTEX concentrations as high as 12,205 µg/l in the central portion of the site. The case received closure from MDE in August 2001. Although MDE closed the OCP case, impacted groundwater may remain which could have migrated beneath the LOD. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2559	<p>The LOD is along the eastern side of Baltimore Avenue (US Route 1), northeast of Circle Drive, in Beltsville, Maryland. The surrounding area was observed to be developed with commercial and retail businesses beginning in the 1940s. This type of development continued in the immediate area up until 1981, when the surrounding area was observed in its current configuration. Several sites in close proximity to the LOD have reported releases and/or former USTS, including a nearby active gas station 60 feet northeast and former gas station 60 feet northwest, and two dry cleaners (one active, one inactive) within an adjacent shopping center to the north with historical subsurface chlorinated solvent contamination. The former gas station, currently an AutoZone, previously had three 10,000-gallon gasoline USTs excavated and removed in 2011. PID readings from the soils excavated, as well as soil below the grade of the former UST was screen with a PID, were non-detect. Soil sample were collected, which did not indicate any substantial subsurface impacts. A Phase II site assessment by the current owner identified gasoline-impacted soil and groundwater near the former tank field, but samples collected closest to the LOD were non-detect, indicating the impacts were localized to the former tank field. Based on this, impacts to the LOD from this gas station is unlikely. The WaWa gas station approximately 60 feet to the northeast was constructed around 2010 and has four 15,000-gallon gasoline USTs. Previously, another gas station was situated on the site up until 1999 and had 3 gasoline USTs ranging in size from 2,000- to 3,000-gallons. No records were identified with the previous gas station that was located at the site. Due to the lack of information on this former gas station, as well as its distance from the LOD, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-2560	<p>The LOD is along the south side of Baltimore Avenue (US Route 1), northeast of Circle Drive, in Beltsville, Maryland. The surrounding area was observed to be developed with commercial and retail businesses beginning in the 1940s. This type of development continued in the immediate area up until 1981, when the surrounding area was observed in its current configuration. Several sites in close proximity to the LOD have reported releases and/or former USTS, including an active gas station directly south of the LOD, former gas station 155 feet northwest, and two dry cleaners (one active, one inactive) within an adjacent shopping center to the north with historical subsurface chlorinated solvent contamination. The former gas station, currently an AutoZone, previously had three 10,000-gallon gasoline USTs excavated and removed in 2011. PID readings from the soils excavated, as well as soil below the grade of the former UST was screen with a PID, were non-detect. Soil sample were collected, which did not indicate any substantial subsurface impacts. A Phase II site assessment by the current owner identified gasoline-impacted soil and groundwater near the former tank field, but samples collected closest to the LOD were non-detect, indicating the impacts were localized to the former tank field. Based on this, impacts to the LOD from this gas station is unlikely. The WaWa gas station directly south of the LOD was constructed around 2010 and has four 15,000-gallon gasoline USTs. Previously, another gas station was situated on the site up until 1999 and had 3 gasoline USTs ranging in size from 2,000- to 3,000-gallons. No records were identified with the previous gas station that was located at the site. Due to the lack of information on this former gas station, as well as its distance from the LOD, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2599	<p>The LOD lies in the ROW between New Hampshire Avenue (MD 650) and the interchange between Colombia Pike westbound and New Hampshire Ave northbound, in Silver Spring, Maryland. New Hampshire Avenue and Colombia Pike have been present since the late 1950s. The area surrounding the LOD was unchanged until construction of the 3rd District Police Station to the north of the LOD in 2013. The police station has reported 2 spill cases related to gasoline deliveries for an onsite AST. The first involved the November 2017 release of 600 gallons of gasoline, which flowed into the nearby landscaped areas and a stormwater bioretention basin. Based on a review of MDE files obtained through a PIA request, impacted soil and water were removed and post-excavation soil sampling analytical results were below regulatory standards. Therefore, MDE closed the case. The second spill involved the release of approximately 100 to 200 gallons of gasohol during a June 2018 delivery. Montgomery County Fire and Rescue responded and the spill was cleaned up with absorbent. No further information was available in the MDE files regarding this spill. In addition, there is an open OCP case related to the closure of a 3,000-gallon diesel UST at the site. According to MDE files, there was no evidence of a release; however, a UST Closure Report was required by January 10, 2020, and no such report was provided in the files. Based on the absence of details on the June 2018 spill at the site and the open OCP case, as well as the proximity of this site to the LOD, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-2600	<p>The LOD lies in the median between Milestone Drive, and the interchange road between Colombia Pike (US Route 29) westbound and New Hampshire Avenue (MD 650) northbound in Silver Spring, Maryland. New Hampshire Ave and Colombia Pike have been present since the late 1950s. The area surrounding the LOD was unchanged until construction of the 3rd District Police Station to the north of the LOD in 2013. The police station has reported 2 spill cases related to gasoline deliveries for an onsite AST. The first involved the November 2017 release of 600 gallons of gasoline, which flowed into the nearby landscaped areas and a stormwater bioretention basin. Based on a review of MDE files obtained through a PIA request, impacted soil and water were removed and post-excavation soil sampling analytical results were below regulatory standards. Therefore, MDE closed the case. The second spill involved the release of approximately 100 to 200 gallons of gasohol during a June 2018 delivery to the AST on site. Montgomery County Fire and Rescue responded and the spill was cleaned up with absorbent and more absorbent was to have been applied if necessary. No further information was available in the MDE files regarding this spill. In addition, there is an open OCP case related to the closure of a 3,000-gallon diesel UST at the site. According to MDE files, there was no evidence of a release; however, a UST Closure Report was required by January 10, 2020, and no such report was provided in the files. Based on the absence of details on the June 2018 spill at the site and the open OCP case, as well as the proximity of this site to the LOD, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2601	<p>The LOD is located along Powder Mill Road (MD 212), approximately 200 feet south of Cherry Hill Road, in Hyattsville, Maryland. The surrounding area is primarily residential with some commercial properties. Development of the surrounding area is observed to begin by 1963, and is in its current configuration by 1994. A gas station, located 425 feet to the north of the LOD, currently operates three USTs onsite and previously operated an additional five USTs. Five OCP cases have also been opened at the site and are closed. Based on a review of MDE files obtained via a PIA request, residual soil and groundwater contamination are present at the site. Further, groundwater flow direction is to the south, towards the LOD. Based on this, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-2602	<p>The LOD is located along Powder Mill Road (MD 212), immediately south of Cherry Hill Road. The surrounding area is primarily residential with some commercial properties. Development of the surrounding area is observed to begin in 1963, and is in its current configuration by 1994. A gas station, located 315 feet to the north of the LOD, currently operates three USTs onsite and previously operated an additional five USTs. Five OCP cases have also been opened at the site and are closed. Based on a review of MDE files obtained via a PIA request, residual soil and groundwater contamination are present at the site. Further, groundwater flow direction is to the south, towards the LOD. Based on this, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-2603	<p>The LOD lies along the eastern side of Beltsville Drive, north of Powder Mill Road, in Beltsville, Maryland. The area surrounding the LOD is primarily commercial properties. Prior to commercial development in 1971, the area was entirely forested land. The surrounding the LOD was observed in its current condition by 2005. There are six sites with active and inactive UST with document releases between 165 and 875 feet crossgradient or downgradient of the LOD. An MDE VCP site, Calverton Shopping Center, is located approximately 15 feet north (upgradient) of the LOD. According to available records found on MDE's LRP website, the site is a commercial strip shopping center that houses an active drycleaner. A Phase I Environmental Site Assessment was completed in March 2012, followed by a Phase II Environmental Site Investigation which collected samples next to the dry cleaner. Analysis of the groundwater samples revealed volatile organic compounds above the department's cleanup standards. Per a 2/24/2017 letter, the Department approved proposed groundwater sampling on an annual schedule and restricted to PCE and its breakdown products. Per a letter from February 2019, MDE stated that groundwater sampling may be discontinued. Based on available information, impacts from the former drycleaner appeared to be isolated to the site, located approximately 215 feet upgradient of the LOD. A PIA request was submitted to MDE for further information on the site; however, MDE did not have any files available at the time of this review. Based on the drycleaner's upgradient direction, impacts cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-2605	<p>The LOD lies along the south side of Powder Mill Road (MD 212), at the exit ramp for I-95 southbound, in Beltsville Maryland. The area surrounding the LOD is primarily commercial properties. Prior to the development of commercial properties in 1971, the area was entirely forested land. The surrounding the LOD was observed in its current configuration by 2005. A gas station located directly northwest (upgradient), at approximately 170 feet of the LOD, has four active petroleum USTs ranging in size from 8,000-gallons to 12,000-gallons and one former 1,000-gallon used oil UST. In 1998, four hydraulic vehicle lifts were removed from the site, as well as retrofitting the onsite USTs, product piping, and dispenser islands. Approximately 135 tons of soil from the dispenser island trenches was excavated and disposed of offsite. In 2000, a petroleum release from one of the regular gasoline USTs was reported. Four monitoring wells were installed around the tank area. No free product was ever observed, but the March 2001 groundwater sampling results identified dissolved BTEX concentrations as high as 12,205 µg/l in the central portion of the site. The case received closure from MDE in August 2001. Groundwater at the site is believed to flow southeast, towards the LOD. Additionally, an MDE VCP site known as the Calverton Shopping Center is located to the west of the LOD. Dry-cleaning operations have resulted in chlorinated solvent impacts to soil and groundwater. The site is believed to be crossgradient of the LOD; however, impacts cannot be ruled out based on a lack of information on the exact location of the impacts. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-2606	<p>The LOD lies along the northern side of Powder Mill Road (MD 212), east of Beltsville Drive, in Beltsville, Maryland. The area surrounding the LOD is primarily commercial properties. Prior to the development of commercial properties in 1971, the area was entirely forested land. The surrounding the LOD was observed in its current condition by 2005. A gas station located directly northwest (upgradient) of the LOD has four active petroleum USTs ranging in size from 8,000-gallons to 12,000-gallons and one former 1,000-gallon used oil UST. In 1998, four hydraulic vehicle lifts were removed from the site, as well as retrofitting the onsite USTs, product piping, and dispenser islands. Approximately 135 tons of soil from the dispenser island trenches was excavated and disposed of offsite. In 2000, a petroleum release from one of the regular gasoline USTs was reported. Four monitoring wells were installed around the tank area. No free product was ever observed, but the March 2001 groundwater sampling results identified dissolved BTEX concentrations as high as 12,205 µg/l in the central portion of the site. The case received closure from MDE in August 2001. Groundwater at the site is believed to flow southeast, towards the LOD. Additionally, an MDE VCP site known as the Calverton Shopping Center is located to the west of the LOD. Dry-cleaning operations have resulted in chlorinated solvent impacts to soil and groundwater. The site is believed to be crossgradient of the LOD; however, impacts cannot be ruled out based on a lack of information on the exact location of the impacts. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-3305	<p>The LOD is located along the west side of Woodfield Road (MD 124) between Snouffer School Road and Lindbergh Drive, in Gaithersburg, Maryland. The surrounding area is a mix of commercial and residential developments. Commercial and residential development is observed to begin prior to 1993. The surrounding area is in its current configuration by 2005. A shopping center adjacent to the LOD had a dry-cleaning facility approximately 150 feet southeast (potentially crossgradient) of the LOD, that historically utilized chlorinated solvents in their dry-cleaning operations. Based on a review of investigation summary reports and analytical soil and groundwater data provided by MDE through a PIA request, soil and groundwater in the immediate vicinity of the LOD is not believed to be impacted by the former dry-cleaner. The shopping center also had two former 550-gallon heating oil USTs that were excavated and removed from the site in 2005 and 2007. No impacts were identified with the UST removed in 2005; however, analytical data showed detected concentrations of TPH-DRO at 85 mg/kg, two feet below the grade of the UST (approximately 7 feet bgs) that was removed in 2007. Both USTs received closure from MDE. Based on this information, residual concentrations of petroleum constituents could be encountered within the limits of the LOD based on the proximity of the former USTs. Thus, further investigation may be warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-3612	<p>The LOD is located north of the intersection of Connecticut Avenue (MD 185) and University Boulevard (MD 193) in Kensington, Maryland. The LOD is surrounded by commercial development. Based on historical aerial and topographic maps, the LOD has never been developed. Development of the surrounding area began prior to 1959, with University Boulevard present and residential development in the surrounding areas. The LOD and surrounding area have been similar to their current configuration since 1988. Seventeen sites were identified within the vicinity of the LOD in the environmental database report. Six of the sites were had listings related to active/ inactive USTs, OCP cases, and/or document spills, but were determined not be an environmental concern based on their proximity to the LOD or are believed to be either hydraulically crossgradient/ downgradient. The only site of concern identified in the database report is an active gas station, adjacent to the north of the with two gasoline USTs. On 2/10/15, a line test failure resulted in a release. According to records provided by MDE, the leak detector on the Premium STP was replaced on 11/16/15 after the old one failed a test. Testing of the system was successfully completed the same day. The site is registered with two active 12,000-gallon gasohol USTs installed on 7/1/1992; five former 4,000-gallon USTs installed in 1953 and removed on 8/3/1987; one 1,000-gallon used UST installed in 1953 and removed on 8/3/1987; and one 1,000-gallon UST of unknown contents installed in 1953 and removed on 8/3/1987. No information was available regarding the removal of the USTs in 1987. In June 2018, the two 12,000-gallon USTs were tightness tested and passed. Based on the proximity of the service station to the LOD and the lack of information regarding the UST closures in 1987, further investigation may be warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-3636	<p>The LOD is located along the central median of Norbeck Road, west of Westbury Road and east of Bel Pre Road/Emory Lane, in Rockville, Maryland. The area consists primarily of single-family residential development, with the area in the south developed in the 1940's -1950's and the remaining area built in the late 1960's. In 1996, a 550-gallon inactive heating oil UST was excavated and removed from a residential property approximately 170 feet south. Soil from 2 feet below the grade of the UST was screen with a PID that recorded readings between 553 ppm to 1002 ppm. MDE instructed the contractor to excavated at least 3 feet below the grade of the former UST, stage the soil onsite and mix in 10-10-10 fertilizer to break down the hydrocarbons. The case was closed approximately 8 months later. Based on a lack of information and analytical data to assess soil and groundwater impacts associate the case, impacts to the LOD cannot be ruled out. Thus, further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-3638	<p>The LOD is located along the central median of Norbeck Road (MD 28), southwest of Muncaster Mill Road, in Rockville, Maryland. The LOD appears to have historically been part of an orchard based on aerial imagery from 1959 and redeveloped as part of Norbeck Road in the 1980s. The surrounding area is primarily residential with an institutional development to the northeast. The surrounding area was historically agricultural and rural residential in the 1950s with further residential development observed to begin in the 1980s. Commercial development to the north is observed to begin around 1971. The surrounding area is observed to be developed in its current configuration by 2005. A catholic school approximately 455 feet north (crossgradient) of the LOD had a 550-gallon heating oil excavated and removed from the site in August 2006. Impacted subsurface media was encountered during the UST closure, which was cleaned up/remediated and the case received closure approximately 2 months later. Based on site's inferred hydraulic gradient in relation to the LOD, impacts are unlikely. However, since the area and LOD have been utilized as an orchard in the 1950s, there is a possibility that residual concentrations of organochlorine pesticides, such as dieldrin, DDT, chlordane, and lindane may be present in soils and sediments within the boundary of the LOD. Further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-3652	<p>The LOD is located on the east side of Hungerford Drive (MD 355), south of the intersection with N Washington Street, in Rockville, Maryland. The LOD consists of a portion of a northbound lane of the road, a landscaped strip of shade trees, a sidewalk, and a portion of the parking lot of The Fitz, a condominium complex located directly east of the LOD. The surrounding area is heavily developed, primarily with commercial uses. Hungerford Rd was constructed in the early 1950's, with development along the road taking place mainly in the 1960's – 1980's. A property approximately 70 feet west of the LOD is listed an MDE VCP site. The facility had one 15,000-gallon diesel UST that was installed in 1978 and removed in 2003. An OCP case for a release and cleanup was opened in 2003 and closed in 2004. The site is on the SHWS and VCP lists. In 2003 a NFRD was issued, restricting the property for commercial or industrial use and prohibiting use of groundwater beneath the property for any purpose. Based on a review of available data, no chemicals or concern were detected in soil boring and groundwater sample collected from the southeastern portion of the site, west of the southern portion of the LOD; however, detected concentrations of benzene (120 ug/l) chloroform (1 ug/l), xylenes (11 ug/l), MTBE (170 ug/l) were recorded in the sample collected along the north-central boundary, approximately 175 feet west of the northern portion of the LOD. Based on groundwater elevation data provided in the available reports, groundwater flows, west/northwest to east/southeast in the direction of the LOD. As this facility appears hydraulically upgradient of the LOD, further investigation is warranted to determine whether or not impacts from this site has impacted environmental media within the LOD.</p>
WAS-3653	<p>The LOD is located along the central median of Frederick Road (MD 355), south of Indianola Drive, in Rockville, Maryland. The surrounding area is a mix of commercial and residential properties. Commercial properties include multiple automotive dealerships, and automotive repair shops. Based on historical imagery, it appears that the commercial properties were developed in the 1970s and 1980s and the residential properties were developed between the late 1980s and early 2000s. Fourteen sites, mostly associated with automotive sales and repair facilities were identified in the area surrounding the LOD. The automotive repair and sale facilities located to the east, northeast, and southeast of the LOD have multiple UST, OCP, and SPILL cases associated with them; however, impacts from these sites are unlikely since they are believed to be hydraulically downgradient of the LOD. An active used car dealership/auto repair facility known as A-1 Auto Sales is approximately 40 feet to the east of the LOD. No environmental records associated with the property were identified; however, due to the current use of the property, automotive fluids and petroleum products are most likely used/stored onsite, and could have been potentially released into the ground, which may have impacted soil and groundwater within the boundaries of the LOD. Therefore, further investigation may be warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4002	<p>The LOD is located west of the intersection of Clarksburg Road and Frederick Road (MD 355), in Clarksburg, Maryland. The surrounding area is a mix of commercial and residential properties. Residential and commercial development is observed to begin prior to 1959. The surrounding area is observed to be in its current configuration by 2005. The LOD sits on/abuts a bank that had a 550-gallon heating oil UST closed in place in 2015, approximately 85 feet northwest (upgradient) of the LOD. Based on available data provided by MDE through a PIA request, a soil sample was collected, approximately 9ft bgs from both east and west sides of the UST and analyzed for TPH-DRO and VOCs. Based on the analytical data, no VOCs were detected in either of the two samples and TPH-DRO was detected at 1,378 mg/kg in the soil sample from the western end of the UST; however, TPH-DRO was not detected above its reporting limit of 30.31 mg/kg in the sample collected from the eastern side of the UST. Based on the information summarized above, residual petroleum is known to be present in the subsurface soil approximately 85 feet northwest (upgradient) of the LOD; therefore, further investigation may be warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-4032	<p>The LOD is along the east side of N Frederick Road (MD 355), north of Henderson Corner Road, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the southeast, commercial development to the west, east, and south. Based on historical aerial and topographic maps, the LOD has never been developed, but has been part of agricultural land. Based on the 1959 aerial photograph, Frederick Road and Ridge Road were present and the LOD and surrounding areas were agricultural land. Residential development started in 1993. Commercial development started by 2005, and the LOD and surrounding areas were relative to their current configuration by 2005. A gas station is located approximately directly east (upgradient) of the LOD. Currently, there are three active 12,000-gallon gasoline USTS registered to the facility that were installed in 1995. The gas station is a SQG of ignitable waste and benzene; no violations were found. Two OCP cases are associated with the gas station, one opened in 1995 for the installation of the three currently active USTs and another one opened in 2007 for the removal of two 40-gallon hydraulic oil tanks. Based on analytical results soils around the two former tanks were not impacts. Several small releases associated with petroleum are also documented at the site but are believed to not be a concern. Even though the regulatory documents reviewed did not indicate any subsurface impacts, the LOD is directly adjacent to the gas station and subsurface impacts within boundaries of the LOD cannot be completely ruled out. Further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4037	<p>The LOD is located along the east side of N. Frederick Road (MD 355), south of Middlebrook Road, in Germantown, Maryland. The LOD is surrounded by commercial properties to the north and west and by residential on small tracks of land to the east and south. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944 and commercial development in the surrounding area was observed by 1993. Ten environmental database listings were identified in the immediate area of the LOD. A trailer park is located directly east of the LOD and has had multiple OCP cases opened due to leaking petroleum storage tanks and surficial releases. A former drycleaner is located approximately 150 feet north of LOD and a VCP site. Soil contaminants included PCE and TPH-DRO. Groundwater contaminants included TCE, cis 1,2-DCE, vinyl chloride, PCE, and both TPH-GRO/DRO compounds. The property entered into the VCP program in 2002 and was issued with an NFRD later that year with land-use controls on soil/groundwater use, as well the maintenance/upkeep of monitoring wells on-site as long as the dry cleaning operations occur and future owner may request abandonment. Based on the proximity of the trailer park and dry-cleaning facility with respect to the LOD, impacts to the LOD cannot be ruled out. Thus, further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>
WAS-4045	<p>The LOD is located along on N. Frederick Road (MD 355) south of Game Preserve Road, in Gaithersburg, Maryland. The LOD is located in both northbound and southbound lanes and is surrounded by commercial to the south, east, and west, as well as forest to the north. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Based on review of the 1959 aerial the LOD and surrounding areas were residential with agricultural land. Residential and commercial development was observed on the 1981 aerial. The LOD and surrounding areas are similar to their current configuration by 1993. Eight environmental sites were identified in the immediate area of the LOD, six of which are in shopping centers that abut the LOD, including a former drycleaner approximately 80 feet upgradient of the LOD. A PIA request was submitted to MDE for additional information regarding the former drycleaner; however, based on MDE's response no additional information was available. A gas station, located approximately 220 feet upgradient, currently has an active 10,000-gallon and 15,000-gallon gasoline USTs installed in 2000. No release associated with USTs with the exception of a small surficial release approximately 1-gallon of gasoline in 2016; however, due the upgradient locations of the gas station and drycleaner to the LOD, impacts cannot be ruled. Further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4048	<p>The LOD is located along the south side of Clopper Road (MD 117), east of Pheasant Run Drive, in Gaithersburg, Maryland. The LOD is surrounded by commercial development. Based on review of historical aerial and topographic maps Clopper Road was present by 1937, and the LOD and surrounding area were agricultural and residential in use. Residential development in the surrounding area was observed in 1972 and commercial development in 1993. Development continued up until approximately 2005, when the surrounding area was observed to be developed in its current configuration. Nine environmental database listings were identified in the immediate area of the LOD. Six of the listings are associated with sites registered as RCRA-SQG and -LQG generators between 50 and 600 feet of the LOD. A property located directly north (upgradient) of the central portion of the LOD was listed in the CERCLIS database due TCE was found in the company's on site well water dated 12/21/1983. A recovery system was installed at the site to address the chlorinated solvents in groundwater. According to a groundwater sampling report from 1996, TCE was detected at 9.8 ug/l in a monitoring well in the southeast portion of the site, in the vicinity of a stormwater pond currently present. According MDE's LRP website, the site received closure in 2012. Based on the available information provided by MDE, impacts to the LOD cannot be ruled out. Thus, further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>

LOD ID	<p style="text-align: center;">Moderate Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4050	<p>The LOD is located along the north side of Clopper Road (MD 117), west of Quince Orchard Road (MD 124), in Gaithersburg, Maryland. The LOD is surrounded by residential development to the north and west, and commercial development to the south and east. The National Institute of Standards and Technology campus is located to the southeast. Based on review of historical aerial and topographic maps the Quince Orchard Road and Clopper Road were present by 1937. The LOD and surrounding area were agricultural and residential in use until commercial and residential development began in 1972, and the LOD and surrounding area are similar to current configuration by 1981. Twelve environmental database listings were identified in the immediate area of the LOD. A shopping center to the south of the LOD listed as a SHWS due to detected concentrations of VOCs in groundwater in the southwestern portion of the site. Based on available information provided my MDE through PIA request. Total VOCs ranged from 37 ug/l to 40 ug/l; however, impacts appear to be isolated to the southwestern portion of the site, as well as groundwater is flowing southeast to northwest, crossgradient of the LOD. A gas station is located south of the eastern portion of the LOD. Four groundwater monitoring wells were installed on site in 2003 that identified elevated levels of petroleum constituents present in subsurface materials (no free product). Several investigations were conducted to determine the extent of the impact area. Based on groundwater elevation gauging, groundwater at the site flow from south to north, towards the eastern portion of the LOD. Between August 2013 and September 2015, injections of magnesium sulfate in to select wells to decrease the concentration of petroleum constituents in the groundwater. In 2016, the maximum detected concentrations of benzene (379 ug/l), toluene (6.9 ug/l), ethylbenzene (126 ug/l), xylene (157 ug/l), and MTBE (901 ug/l) were recorded at the site. Based on the data and that the magnesium sulfate injections had substantially decreased the concentrations of petroleum constituents in the groundwater, locally. MDE granted closure to the site in July 2017. Based on the detected concentrations in the last round of sample, as well as that the gas station is hydraulically upgradient of the LOD, impacts to the LOD cannot be ruled out. Thus, further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4083	<p>The LOD is located along Germantown Road (MD 118), west of Crystal Rock Drive, in Germantown, Maryland. The LOD is surrounded by commercial development. Based on review of historical aerial and topographic maps, Germantown Road has been present since 1944. Development in the surrounding area began by 1993 and is similar to current configuration by 2005. Ten environmental database listings were identified in the immediate area of the LOD. Three gas stations located approximately 315 to 330 feet to the LOD. The Chevron gas station located approximately 330 feet east of the LOD currently has four 10,000-gallon gasoline and diesel USTs and three permanently out-of-use USTs that were removed from ground in November 1989. A subsurface investigation was conducted at the site after the removal of the USTs that identified elevated levels of petroleum constituents in the groundwater onsite; however, no free product was observed during the investigation. Five groundwater monitoring wells were installed during the initial investigation and were sampled quarterly which showed decreasing levels of the petroleum constituents over time. The monitoring wells also indicated that groundwater at the site was flowing southeast to northwest, towards the eastern portion of the LOD. In 1993, MDE granted no further action to the site and case was closed. Based on the analytical results from the last round of sampling conducted in the fourth quarter of 1992, benzene was non-detect and total BTEX was 366 ug/l in the monitoring nearest the LOD. Since no other sampling has been conducted since then, it is possible that petroleum constituents have migrated into or near the eastern portion of the LOD. Further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-4087	<p>The LOD is located along the north side of Germantown Road (MD 118), west of Waters Road, in Germantown, Maryland. The LOD is surrounded by commercial to the north, south, and east and the forested area around the railroad to the west. Based on review of historical aerial and topographic maps, Germantown Road has been present since 1944. Development in the surrounding area began by 1993 and is similar to current configuration by 2005. Nine environmental database listings were identified in the immediate area of the LOD. A site located directly north (upgradient) of the LOD was previously utilized as a towing company that impacted soil and groundwater over time due to illicit releases, poor housekeeping practices, and releases from USTs and ASTs. As part of the redevelopment of the site in mid-2010s, all USTs were excavated and removed and a site wide subsurface investigation was conducted that resulted in the excavation and removal of over 13,694 tons of impacted soil that was disposed of offsite. Based on available groundwater sampling data, samples were collected from seven monitoring wells onsite and analyzed for VOCs and petroleum constituents, which were all non-detect or below MDE action levels with the exception of the TPH-DRO that ranged between 0.12 ug/l and 0.29 ug/l that exceeded its action level of 0.047 ug/l and tetrachloroethane at 6.4 ug/l that exceeded its corresponding action levels of the 5 ug/l. Groundwater is believed to be between 25 and 44 feet bgs and flows south/southwest towards the LOD. Since the site is upgradient of the LOD, impacts to the LOD cannot be ruled out. Thus, further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4091	<p>The LOD is located in the central median of I-370, west of the Frederick Road (MD 355) underpass, in Gaithersburg, Maryland. The surrounding area is a mix of commercial and residential developments to the south and residential developments among forested land to the north. Commercial and residential development began prior to 1971, and is observed in its current configuration by 2005. Three OCP cases are located between 270 feet and 455 feet from the LOD. The most concerning of which, the All State Leasing Co. located 270 feet in an apparent hydraulically upgradient direction, has documented groundwater impacts present. In March 1994, a 15,000-gallon gasoline UST was excavated and removed. PID readings up to 2,100 ppm were identified directly beneath the former UST. A monitoring well installed adjacent to the former UST exhibited a total BTEX concentration of 17,600 ug/L, well above the MDE Groundwater Standards. MDE closed the OCP case in 1999 based on the justification that the surrounding area is connected to public water. As this facility appears hydraulically upgradient of the LOD, further investigation is warranted to determine whether or not impacts from this site has impacted environmental media within the LOD. The remaining records of concern are not anticipated to have an impact on the LOD due to either their distance, hydraulic direction, or case status.</p>
WAS-4111	<p>The LOD is located along the southern side of Pennsylvania Avenue (MD 4), immediately west of Walters Lane, in District Heights, Maryland. The surrounding area is predominantly residential and commercial properties. Construction of Pennsylvania Avenue, as well as residential development in the surrounding area, began in the late 1950s. Commercial development began in the 1970s, and the surrounding area appeared in their current configuration by 2005. Six facilities in the surrounding area were listed on one or more environmental database. The most concerning of these is a gas station located 55 feet southeast from the LOD. This gas station has multiple closed and active USTs, OCP cases, and has a history of environmental impacts. Review of MDE files indicated that remediation activities were conducted for the OCP cases and they were all closed to MDE's satisfaction. However, there are several spill reports, including for tightness testing failures, for which there was no additional information in the files. Based on the proximity of this facility to the LOD and lack of information on certain incidents, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4119	<p>The LOD is located along the northern side of Walker Mill Road, immediately east of Hazelwood Drive, in Capitol Heights, Maryland. The surrounding area is predominantly residential and commercial properties, with some light industrial properties to the northeast. Walker Mill Road was observed as early as 1937 but was later widened and in its current configuration by the early 1970s. Residential development began in the 1950s to 1970s and commercial development began in the 1970s. The LOD and surrounding area appeared in their current configuration by 2018. Several closed OCP cases were noted within the vicinity of the LOD; however, one of these closed OCP cases abuts the LOD to the north, while the others are located on properties hydraulically downgradient from the LOD. A dry cleaner was identified south of the LOD with historical PCE impacts in groundwater. Given the drycleaner is located hydraulically downgradient from the LOD, impacts to the LOD from this drycleaner is unlikely. A PIA request was submitted to MDE for the OCP site abutting the LOD to the north; however, MDE responded stating no files were available. Due to the limited information on this OCP case, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-4131	<p>The LOD is located on the northwestern side of Silver Hill Road, spanning the southeastern portion of the property at 4500 Silver Hill Road, in Suitland, Maryland. Historically, a building was located on a portion of the LOD based on an aerial image from 1949, which was then demolished by 1977. The surrounding area is predominantly residential and commercial properties. The residential development in the area began in the 1940s and commercial development began in the 1970s. The LOD and surrounding area appeared in their current configuration by 2007. Given a building was formerly constructed on the LOD and was demolished, it is possible that fill material is present on the LOD. Further, it is unknown how this building was heating, so historical USTs may have been present. An historical gas station with multiple closed USTs, properties with OCP cases, an automotive repair facility, and two dry cleaning facilities are abutting the LOD to the south. Based on a review of available information provided by MDE through PIA requests, no substantial releases have occurred in the vicinity and the surrounding sites are not believed to have impacted the LOD. However, given the potential for USTs or fill material from the previous development at the LOD, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to any intrusive groundwork to determine whether or not impacted material is present within the boundaries of the LOD.</p>
WAS-4150	<p>The LOD is located along the east side of Ridge Road (MD 27), north of Apple Orchard Way, in Germantown, MD. An apple orchard, fields, and forested land is to the east of the LOD and dense single-family residential, constructed from 2013-2017, to the west. Although no records of concern in the vicinity of the LOD were identified during the environmental review, the LOD has a long history of agricultural use, from at least the 1950's. Therefore, there is a possibility that residual concentrations of organochlorine pesticides, such as dieldrin, DDT, chlordane, and lindane may be present in soils and sediments within the boundary of the LOD. Thus, further investigations may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4156	<p>The LOD is located along the west side of Beallsville Road, west of Sellman Road in Dickerson, Maryland. The surrounding area is primarily forested land and agricultural land, with the exception of a railroad line running east to west through the northern portion of the LOD. No substantial changes to the surrounding area have occurred since the late 1950s. In 2016, approximately 200 pounds of batteries fell from a work truck, approximately 50 feet northeast of the LOD. The batteries were damaged and a contractor was hired to clean up the spill. Due to the nature of the incident, impacts to the LOD are unlikely. However, there is the possibility of petroleum or creosote impacted soils to be present within the vicinity of the railroad infrastructure. Further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-4163	<p>The LOD is along the east side of N Frederick Road (MD 355), north of Henderson Corner Road, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the southeast, commercial development to the west, east, and south. Based on historical aerial and topographic maps, the LOD has never been developed, but has been part of agricultural land. Based on the 1959 aerial photograph, Frederick Road and Ridge Road were present and the LOD and surrounding areas were agricultural land. Residential development started in 1993. Commercial development started by 2005, and the LOD and surrounding areas were relative to their current configuration by 2005. A gas station is located approximately directly east (upgradient) of the LOD. Currently, there are three active 12,000-gallon gasoline USTS registered to the facility that were installed in 1995. The gas station is a SQG of ignitable waste and benzene; however, no violations were found identified during this review. Two OCP cases are associated with the gas station, one opened in 1995 for the installation of the three currently active USTs and another one opened in 2007 for the removal of two 40-gallon hydraulic oil tanks. Based on analytical results soils around the two former tanks were not impacts. Several small releases associated with petroleum are also documented at the site but are believed to not be a concern. Even though the regulatory documents reviewed did not indicate any subsurface impacts, the LOD is directly adjacent to the gas station and subsurface impacts within boundaries of the LOD cannot be completely ruled out. Further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4164	<p>The LOD is located along the north side of S Frederick Avenue (MD 355), southeast of N Westland Drive, in Gaithersburg, Maryland. The surrounding area is primarily commercial developments with residential properties further out in all directions. Residential and commercial development is observed to begin around 1951, and continued through 1993, when the surrounding area was observed in its current configuration. According to the environmental database report, ten sites were listed in the vicinity of the LOD. Of those ten sites, four of them had former/current USTs, reported spills, and/or OCP cases associated with them. One of those sites, gas station approximately 85 feet north (downgradient) of the LOD was identified as a potential concern to the LOD based on its proximity. In 2000, three 10,000-gallon gasoline USTs were excavated and removed from the site and one 10,000-gallon gasoline and one 12,000-gallon gasoline USTs (both fiberglass) were installed in their place and are still active. Records state the impacted soil will be taken offsite and disposed of; however, it is unknown the quantity removed or if residual impacted soil is still present onsite. Additionally, there are three other OCP cases associated with this site; however, files were not provided by MDE through the PIA request. Even though, the gas station is believed to be downgradient of the LOD, impacts cannot be ruled out based on a lack of historical information reviewed. Thus, further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-4201	<p>The LOD is located along the west side of Dickerson Road (MD 28), transecting and south of the intersection with Mouth of Monocacy Road, in Dickerson, Maryland. The surrounding area is a mix of commercial and residential properties, rural agricultural land, and forested areas. A railway is situated approximately 970 feet south of the LOD. In 1959 the town was primarily agricultural and residential properties. The surrounding area was observed to be developed in its current configuration in around 1981. The environmental database report listed the Ellis L. Roberson property, approximately 50 feet to the south (crossgradient) as having three 1,000-gallon gasoline USTs that excavated and removed from the site in 1976 and no petroleum release was reported. A PIA request was submitted to MDE for further information; however, MDE stated that no other documentation was available. Since the site is crossgradient of the LOD, impacts to the LOD cannot be ruled out. Thus, further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

LOD ID	Moderate Risk LOD Table Ranking Rationales
WAS-4533	<p>The LOD is located along the west side of N. Frederick Road (MD 355), south of Odendhal Avenue, in Gaithersburg, Maryland. The LOD is surrounded by commercial properties. The Lake Forest Mall is located to the northeast. Based on review of historical aerial and topographic maps, Frederick Road has been present since at least 1944. Commercial development was observed by 1971. The LOD and surrounding areas are similar to their current configuration by 2005. Eleven environmental database listings were identified in the immediate area of the LOD. Seven of the sites were either gas stations, VCP sites, or had reported release and/or former USTs. A PIA request was submitted to MDE for further information on these sites. Based on a review of available information, the sites were determined to be hydraulically downgradient, crossgradient of the LOD or impacts were believed to be isolated to the site. However, the LOD abuts a gas station located directly to the south that has an open OCP related to dissolved and free phase product present in groundwater at the site that is currently being addressed by skimmer pumps, as well as being monitored by quarterly sampling. Based on the proximity of the gas station to the LOD, impacts to the LOD cannot be completely ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>
WAS-4606	<p>The LOD is an open field located at the southwest corner of the intersection of Darnestown Road (MD 28) and Turkey Foot Road, in Gaithersburg, Maryland. The surrounding area can be classified as a semi-rural suburban area. Residential houses and open space adjoin the property to the north, east, and west. A church, followed by a school, are observed to the south the LOD, beyond Darnestown Road. The surrounding area to the east and southeast were observed to be developed with residential and commercial properties as early as 1968. Residential and commercial development continued through 2018 when the LOD and surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review; however, review of historical topographic maps identified an underground petroleum pipeline running north to south directly west of the LOD. Review of the National Pipeline Mapping System confirmed a pipeline to be present. The pipeline is likely buried 3 to 6 feet below grade surface. No releases associated with the pipeline have been reported in the immediate vicinity of the LOD; however, due the proximity of this pipeline to the LOD. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

ATTACHMENT D-3
Low Risk LOD Table

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
MO_00018	<p>The LOD is located along a stream known as Rock Run, west of Falls Bridge Lane and between Falls Road and Oaklyn Drive, in Potomac, Maryland. The surrounding area is residential with commercial properties located further to the north. The surrounding area was primarily forested and agricultural land up until the 1960s when residential development began to occur to the east, west, and south, and commercial development to the north. By 1981, the surrounding area was observed to be developed in its current configuration. Nine OCP cases associated with residential heating oil USTs and ASTs are located between 115 feet to 640 feet to the east, west, and south of the LOD. Based on the local topography, the OCP cases are either cross- or downgradient of the LOD. Based on their distance, lack of release, or hydraulic direction from the LOD, none of these sites are believed to have an impact on the LOD. Additionally, two closed MDE Land Restoration Program/Voluntary Clean-Up Program (LRP/VCP) sites with land-use restrictions were identified. These include the Potomac Promenade and the Potomac Place Shopping Center, located approximately 400 feet to the north and 640 feet to the northeast of the LOD, respectively. Based on information provided by MDE, chlorinated solvents in soil and groundwater are present beneath both sites; however, the impacted areas appear to be isolated to each of the properties. The impacted area within the Potomac Promenade Site is approximately 500 feet to the north of the LOD, while the impacted area on the Potomac Place Shopping Center is believed to be approximately 1,075 feet to the northeast of the LOD. Since environmental impacts do not appear to have migrated outside the boundaries of either site, impacts to the LOD are unlikely.</p>
MO_00029	<p>The LOD is located along Silver Creek, a tributary of Rock Creek further to the south, located in Kensington, Maryland. The LOD is north of I-495, east of Kensington Parkway, south of Littledale Road and bisected by Saul Road, East Bexhill Drive and Beach Drive. The surrounding area is primarily residential. A middle school and senior living center abut the northeastern boundary of the LOD. The southern portion south of Beach Drive and north of I-495 is primarily forest land along Rock Creek, flowing west to east. Residential development began before the 1930s to the east and north and continued through early 1960s. In the 1940s a junior high school was constructed to the east of the northern portion of the LOD, near where the current middle is situated. The high school was demolished around 1988 and the site was converted into a park until 1998, when the senior living center was constructed and eventually the new middle school in 2017. During construction of the new middle school, a 10,000-gallon heating oil UST associated with the old junior high school was identified. Available records and analytical data provided by MDE indicate that the former UST had not substantially impacted soils beneath the former UST. Two OCP cases related to spills were identified near the LOD. The first OCP case, located approximately 15 feet west of the southern portion of the LOD, was likely a surficial release associated with a vehicle accident based on the location description. Based on the local topography, any material released to the surface would have flowed towards the west to southwest, away from the LOD. The second OCP case, occurring approximately 430 feet west of the central portion of the LOD, does not specifically state a release or cleanup actually occurred. Both cases have received closure and impacts were most likely isolated and surficial in nature. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<p><i>MO_00047</i> A</p>	<p>The LOD is located along a stream known as Gunners Branch, south of Wisteria Drive and north of Clopper Road, in Germantown, Maryland. A school and residential properties are located to the west. Railroad tracks running east to west, followed by a manmade lake known as Gunners Lake are located to the north, along with additional residential properties. The area to the south and east is primarily forested land. Based on historical imagery, the surrounding area was primarily agricultural and forested land up until the 1980s, when residential structures to the east and west began to be constructed. The lake to the north along with additional residential structures were created/developed by 1993. No records of concern were identified during the environmental review.</p>
<p><i>MO_00051</i></p>	<p>The LOD is located along an unnamed stream on forested land owned by the Maryland National Capitol Planning Commission, directly west of the Little Falls Road and east of Kennedy Drive, in Bethesda, Maryland. The surrounding area has been primarily residential since at least the 1960s. A municipal pool and sports field were first observed to the east, beyond Little Falls Road in a 1981 aerial photograph. No substantial changes to the surrounding area were observed past 1981. A facility listed in the UST and OCP databases, located 750 feet to the east, involved the closure of a heating oil UST in 1998. No environmental impacts were encountered during the closure of the heating oil UST. Based on the distance of the former UST and lack of impacted media encountered during the closure, impacts to the LOD are unlikely.</p>
<p><i>MO_15400</i> 45</p>	<p>The LOD is located along an unnamed stream, east of Great Seneca Highway, south of Cottage Garden Drive, and north Millhaven Place in Germantown, Maryland. The surrounding area is primarily residential with the exception of a school to the west, beyond Great Seneca Highway, and a shopping center further to the south. A sports field and tennis courts are observed to the east. The surrounding area was primarily forested and agricultural land up until 1981, when residential development was observed to the northeast. Development steadily continued in the surrounding area through 2005, when the LOD and surrounding area were observed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<p><i>MPAO_00</i> 14</p>	<p>The LOD is located along an unnamed tributary of Northwest Branch Anacostia River, north of Bonifant Road, south of Stonegate Road, east of Notley Road and Stonewall Drive, and west of Stonegate Drive, in Silver Spring, Maryland. The surrounding area is primarily residential with the exception of a municipal pool directly north of the LOD (constructed in mid-1980s) and a school directly west of the northern portion of the LOD (constructed in the mid-1970s). The surrounding area was primarily agricultural land, up until the 1970s, when residential development began to the west, north, and southeast of the LOD. Residential development continued through the late 1980s, when the LOD and surrounding area were observed to be developed in their current configuration. Three OCP cases were identified in the surrounding area. The adjacent elementary school had a 10,000-gallon heating oil UST removed in 2000. According to available records, no holes were observed in the excavated UST and no impacted soils were encountered. PID readings from the bottom of the excavation were recorded at around 27 ppm. The MDE inspector on-site instructed the excavation to be backfilled and the case was subsequently closed. The second OCP, located 470 feet from the LOD, was associated with the removal of a 550-gallon heating oil UST. No release was noted with this UST. The third OCP case, located 565 feet from the LOD, also involved the removal of a 550-gallon heating oil UST. A release from a product line was noted, which was addressed and the case subsequently closed. Two de minimis surface release were also noted, neither of which would impact the LOD.</p>
<p><i>MPAO_00</i> 15</p>	<p>The LOD is located along an unnamed tributary of Rock Creek, south of Veirs Mill Road (MD 586), east of Halpine Road/Twinbrook Parkway and north of Elsdale Court, in Rockville, Maryland. The area to the south and west is currently developed with multi-family residential complexes. Forested land along Rock creek is observed to the east and north, followed by residential neighborhoods beyond. The surrounding area was primarily agricultural and forested land up until the late 1950s, when residential development and construction of Veirs Mill Road were observed to then north/northwest. The apartment complexes to the west were observed to be present by the early 1970s. Residential development continued to the west and northwest through approximately the early 1980s, when the surrounding area was observed to be developed in its current configuration. In 2016, residents in the apartment complex to the west of the LOD lodged a complaint related to air emissions associated with diesel generators used by Washington Sewer and Sanitary Commission during an unspecified work activity. It is unknown if the air emission complaint was resolved; however, since this is a complaint was related to air emissions and not a release to soil and/or groundwater, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<p><i>MPAO_00 22-Backup</i></p>	<p>The LOD is located along Sligo Creek, north of Ladd Street and between Blueridge Avenue and Lamberton Drive, in Silver Spring, Maryland. The surrounding area can be characterized as mixed-use commercial/residential. Forested lands with residential properties and a school beyond are to the north, residential properties are to the west and south, and forested land followed by commercial and residential properties beyond are to the east. The surrounding area was forested and agricultural land up until the 1950s. The commercial shopping center to the east was observed in the early 1970s. By the late 1980s, the surrounding area was observed to be developed in its current configuration, including the construction of the school to the north. The existing school was demolished in the early to mid-2000s and a new school was constructed in its place. No records of concern were identified during this environmental review.</p>
<p><i>MPOC000 6_0010_00 11</i></p>	<p>The LOD is located along Willett Branch, east of Little Falls Parkway and Arlington Road in Bethesda, Maryland. The LOD is bisected by Hillandale Road and consists of forested land managed by the Maryland National Capitol Parks and Planning Commission. The surrounding area has been primarily residential since at least the 1960s. A municipal pool directly west of the LOD and sports fields to the northeast. No substantial changes to the surrounding area were observed past 1981. An OCP case was opened in November 1995 in response to a citizen reporting a petroleum odor and observable sheen on Willett Branch, within the LOD. An MDE inspector was mobilized who also observed the odor and sheen, but could not find a source. The surrounding area was searched for leaking residential heating oil tanks and discarded petroleum containers, but neither were found. The MDE inspector concluded that someone had illicitly dumped waste oil into the stream. The site was inspected by MDE approximately 1 month later and no evidence of petroleum or odors were encountered. Subsequently, the OCP case was closed. Based on the available information, the amount of oil that was illicitly discharged appears to have been minimal in volume. Further, over the past 26 years, natural attenuation processes such as dilution, dispersion and biological degradation would have been ongoing to reduce any residual impacts that originally occurred. Thus, impacts are not anticipated to remain within the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>MPOC-0008</i>	<p>The LOD is located along an unnamed tributary of Sand Branch, east of Glen and Travilah Roads and south of Briarbrush Lane, in Rockville, Maryland. The surrounding area is primarily residential. A park/sports field abuts the LOD to the south. The surrounding area was primarily agricultural land with residential and farm properties interspersed throughout. Starting the 1980s, residential development began on the adjoining properties. The park/sports field to the south of the LOD was constructed in 2015. Two records of concern were identified. The first, an OCP case located 265 north of the LOD, was opened for the removal of a 550-gallon residential heating oil UST in May 1999. According to documents provided by MDE, impacted soils were identified in the excavation following removal of the UST. A soil sample was collected outside the excavation as well as a groundwater sample from an onsite potable well which were later analyzed for TPH-DRO and BTEX. The analytical results were non-detect for both the soil and groundwater sample and MDE subsequently closed the case. Based on this information, the identified impacts appear localized to the former UST; therefore, impacts to the LOD from this incident are unlikely. The second record, an ERNS and SPILLS incident located 635 feet to the west, was associated with leaking drums and paint containers. Based on distance and hydraulic direction (downgradient), this incident is unlikely to have any impact on the LOD.</p>
<i>MPOC-0009</i>	<p>The LOD is located along a stream known as Cabin Branch, in a forested area west of Goshen Road and north of Centerway Road, in Gaithersburg, Maryland. The surrounding area is primarily residential properties and open space. The property that the LOD is located on is owned by the Maryland National-Capital Park & Planning Commission. The surrounding area was primarily agricultural land up until the 1980s when residential development began to occur. The surrounding area were observed to be developed in its current configuration by 1993. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
<i>PAX-0014</i>	<p>The LOD is within the central median along Landover Road (MD 202), south of the intersection with Lottsford Road, in Bowie, Maryland. The surrounding area was primarily agricultural land until the 1980s when commercial development began to occur to the west of the LOD, which has continued through present day. No records of concern that would have an impact on the LOD were identified during the environmental review.</p>
<i>PAX-0016</i>	<p>The LOD is located along the western side of the southeastern onramp of northbound Central Avenue (MD 214) from I-495, in Hyattsville, Maryland. The surrounding area was primarily agricultural and forested land up until 1964, when the capital beltway (I-495) was constructed. Development to the north, south, and southwest had continued up until present day, as a residential development is observed to be under construction directly southeast of the LOD. No records of concern in the vicinity of the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-0017</i>	<p>The LOD is located along the north side of Central Avenue (MD 214), west of the onramp to northbound I-495, in Upper Marlboro, Maryland. The surrounding area is primary commercial with some multitenant residential facilities. A residential development is observed to be under construction to the south of the LOD. Based on a review of historical imagery, I-495 was constructed in the early to mid-1960s. The surrounding area was primarily agricultural land forested and up until the 1980s, when commercial and residential development was observed to occur. Development in the area continues to occur through present day. No records of concern in the vicinity of the LOD that are believed to impact the LOD were identified during this environmental review.</p>
<i>PAX-0018</i>	<p>The LOD is located along the west side of Landover Road (MD 202), north of Lottsford Road, in Upper Marlboro, Maryland. The surrounding area is mixed-use commercial/residential. The surrounding area was primarily agricultural land up until the 1990s, when commercial development is observed to begin. Development continued through the late-2000s, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD that are believed to impact the LOD were identified during this environmental review.</p>
<i>PAX-0019</i>	<p>The LOD is located along the central median of Landover Road (MD 202), north of Technology Way, in Upper Marlboro, Maryland. The surrounding area was primarily agricultural land until the 1980s, when commercial development began, and has continued through present day. No records of concern in the vicinity of the LOD that are believed to impact the LOD were identified during this environmental review.</p>
<i>PAX-0020</i>	<p>The LOD is located in the northwest corner of the intersection of Central Avenue (MD 214) and Hill Road, in Pepper Mill Village, Maryland. Forest and commercial properties are located to the east and west of the LOD, forest and residential properties to the north, and residential properties and cleared vacant land to the south. Based on a review of historical imagery, the surrounding area was historically agricultural land up until the 1970s, when a group of residential apartment complexes were observed to the south, beyond Central Avenue, as well as commercial properties to the east and west. Development continued in all directions up until 1989, when the surrounding area was observed to be developed in its current configuration. In 1997, a motor vehicle accidental resulted in a surficial petroleum release at the intersection of Hill Road and Central Avenue. The material was addressed and the case was closed two days later. The release would have been surficial to an impervious surface (the roadway) and was cleaned up; therefore, impacts to the LOD are unlikely. In May 2017, a vehicle struck a transformer located 655 feet from the LOD releasing 50 gallons of mineral oil. Based on the distance of this incident from the LOD, impacts to the LOD are unlikely.</p>
<i>PAX-0022</i>	<p>The LOD is located along the central median of Landover Road (MD 202), immediately north of Lake Arbor Way/Arena Drive, in Upper Marlboro, Maryland. The surrounding area was primarily agricultural land until the 1980s, when commercial development was observed to have begun. Commercial development continued through 2013, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD were identified during this environmental review.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
PAX-0026	<p>The LOD is located at the intersection of Central Avenue (MD 214) and the onramp from southbound Landover Road/Largo Road (MD 202), in Upper Marlboro, Maryland. The surrounding area was observed to be primarily developed as agricultural land up until the 1980s, when residential development was observed to begin south of the LOD. Construction of the MD 202/MD 214 interchange was ongoing in 1993. The LOD and surrounding area were observed in their current configuration around 2005. No records of concern were identified during this environmental review.</p>
PAX-0029	<p>The LOD is located along the south side of Central Avenue (MD 214), west of Campus Way, east of Landover Road (MD 202), in Upper Marlboro, Maryland. Residential neighborhoods are located to the north and southwest, while commercial facilities are located immediately south and east, and further to the west. The surrounding area was primarily vacant agricultural land until approximately the 1970s, when commercial and residential development began. Three facilities of concern were identified, a Maryland DMV office, a former dry cleaner, and a gas station. The DMV facility received an administrative NOV in 2011 for an unknown reason. No other violations were found in regard to this facility. Based on the age this violation and no reports of an environmental release, it is not considered a concern. A shopping center directly to the southeast (crossgradient) previously had a dry cleaner that conducted dry cleaning onsite. Several other facilities in the shopping center area were listed as having RCRA permits and a 1,000-gallon heating oil UST was removed from the site in 2000 (no contamination found). An active gas station is present 865 feet to the east (crossgradient) which has existed since approximately 1973. Known releases have occurred, as well as possible remediation based on an air permit related to vapor recovery; however, based on the distance, and inferred hydraulic direction, impacts to the LOD are unlikely.</p>
PAX-0034	<p>The LOD is located on the north side of John Hanson Highway (US Route 50), west of the Church Road overpass, in Bowie Maryland. Residential properties are located to the south, a small private airfield is located to the west, vacant land is to the west, and north, followed by residential properties. The surrounding area was primarily vacant agricultural land up until 2005, when residential development began. The area was observed in its current configuration around 2018. No records of concern were identified during this environmental review.</p>
PAX-0039	<p>The LOD is located on the west side of Enterprise Road (MD 193), north of the intersection with Decesaris Boulevard, in Mitchellville, Maryland. The surrounding area is mixed-use composed of residential, agricultural, and vacant properties. The surrounding area and LOD were primarily developed as agricultural land up until the 1980s, when residential development began to the northwest and southeast. A school to the southwest was first observed in historical imagery in 2005, when the LOD and surrounding area was observed to be developed in its current configuration. The church located approximately 645 feet to the northeast, was constructed in approximately 1993. The church had two 1,000 gallon heating oil USTs that were excavated and removed from the site in 1998. According to available information, no impacts were identified during the UST removals; therefore, MDE granted closure for the USTs. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-0041</i>	<p>The LOD is located along the east side of Enterprise Road (MD 193), south of Decesaris Boulevard, in Mitchellville, Maryland. Residential properties are to the northwest and southeast. A school to the east, agricultural fields to the west, and forested land to the northeast. The surrounding area was primarily developed as agricultural land up until the 1980s, when residential development began to the northwest and southeast. The school was first observed in historical imagery in 2005, when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
<i>PAX-0042</i>	<p>The LOD is located along the central median of Central Avenue (MD 214), west of Lake Arbor Way/Kettering Drive, in Upper Marlboro, Maryland. The surrounding area was observed to be primarily agricultural and forested land up until the late 1970s/early 1980s, when residential development began to the northeast and south. Based on historical imagery, Central Avenue was widened to include a median around 1988. The surrounding area was observed to be developed in its current configuration around 2005. No records of concern were identified during this environmental review.</p>
<i>PAX-0045</i>	<p>The LOD is located along the south side of Largo Road (MD 202), east of White House Road, in Largo, Maryland. The surrounding area is primarily vacant forested land. Residential properties are located further to the northwest. Two small ponds are located to the north, beyond Largo Road. The surrounding area has remained primarily forested and agricultural land since at least the 1960s. No records of concern were identified during this environmental review.</p>
<i>PAX-0046</i>	<p>The LOD is located within the median of Largo Road (MD 202), north of Kettering Drive, in Upper Marlboro, Maryland. The surrounding area is primarily developed with residential properties. A school is located to the northwest of the LOD and a nursing home to the southeast. The surrounding area has remained primarily vacant agricultural land up until the early 1980s, when residential properties began to be developed to the west. The nursing home and school were both constructed in the later 1970s to early 1980s. In 2017, a 1,000-gallon diesel UST was excavated and removed from the nursing home facility, during which impacted material was encountered, addressed, and the case was closed several months later. Based on the topography, this facility is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-0047	<p>The LOD is located within the central median of Largo Road (MD 202), north of the intersection with Mt Lubentia Way/Drumsheugh Lane, in Upper Marlboro, Maryland. The surrounding area is primarily developed with residential properties. The surrounding area had remained primarily vacant agricultural land up until the early 1980s, when residential properties began to be developed to the west. A church/private school was constructed to the southeast around 1973. The surrounding area we observed to be developed in its current configuration around 1993. Two facilities of concern were identified, the church/private school and a nursing home. In 2000, the church/private school excavated and removed two 8,000-gallon heating oil USTs. According to available information, one of the USTs was found to have impacted the surrounding subsurface area, which was addressed, and the case was closed several months later. A review of aerial photographs and the local topography indicate these former USTs were located approximately 300 feet east of the LOD. In 2017, a nursing home located approximately 335 feet to the north excavated and removed a 1,000-gallon diesel UST. The former UST was found to have impacted the surrounding subsurface area, which was addressed, and the case was closed several months later. Based on the local topography, both facilities are believed to be crossgradient from the LOD. Thus, impacts to the LOD are unlikely, based on the proximity of the sites relative to the LOD.</p>
PAX-0048	<p>The LOD is located within the central median of Largo Road (MD 202), north of Mt Lubentia Way/Drumsheugh Lane, in Upper Marlboro, Maryland. The surrounding area is primarily developed with residential properties. The surrounding area had remained primarily vacant agricultural land up until the early 1980s, when residential properties began to be developed to the west. Development continued through 1993, when the surrounding area were observed to be developed in its configuration. One record of concern, a church/private school located approximately 385 feet to the north, excavated and removed two 8,000-gallon heating oil USTs in 2000. According to available information, one of the USTs was found to have impacted the surrounding subsurface area, which was subsequently addressed and the case was closed shortly thereafter. Based on the local topography, this facility is believed to be crossgradient of the LOD, and is hydraulically separated from the LOD by an intermittent stream. Based on distance and inferred hydraulic direction, impacts to the LOD are unlikely.</p>
PAX-0049	<p>The LOD is located along the central median of Central Avenue (MD 214), west of Enterprise Road/Watkins Drive (MD 193), in Mitchellville, Maryland. The surrounding area was primarily rural agricultural land up until the 1980s. The shopping center immediately to the north was constructed in the early 1990s, and the surrounding area was observed in its current condition by 2005. Several environmental records were noted, most notably a former drycleaner and a gas station. The dry cleaner, located 400 feet to the north (upgradient), has no reported violations or releases. Based on distance from the LOD and no reported violations, impacts to the LOD from the dry cleaner are unlikely. The gas station, located 620 feet to the northeast, has documented releases including an OCP case for contaminated groundwater. However, based on local topography, the gas station is believed to be crossgradient of the LOD, as well as the LOD is hydraulically disconnected from the LOD by a stream running northeast to southwest. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-0051</i>	<p>The LOD is located along the central median of Watkins Park Drive (MD 193), south of Central Avenue (MD 214), in Kettering, Maryland. The surrounding area is mixed use development. Residential apartments are located to the west and south, commercial and forested land to the north, and a shopping center to the east. The LOD and surrounding area were primarily forested and agricultural land up until the early 1980s, when Watkins Park Drive was constructed and residential development began to occur in the surrounding area. By 1988, the LOD and surrounding area were observed to be developed in their current configuration, when the shopping center to the east was constructed. An inactive drycleaner facility is located approximately 600 feet to the northeast of the LOD, in the shopping center. The former dry cleaner received several NOV's for air emissions in 2002; however, the issue was eventually resolved. Based on this info, impacts to the LOD from the former dry cleaner are unlikely.</p>
<i>PAX-0059</i>	<p>The LOD is located along the central median of Largo Road (MD 202), west of Watkins Park Drive (193), in Upper Marlboro, Maryland. The surrounding area is primarily residential, with the exception of a high school to the south of the LOD. The surrounding area was primarily rural vacant land up until approximately 1981, when the high school was constructed to the south. Residential development was observed to have occurred to the north beginning around 1993. The area was observed to be developed in its current configuration by 2006. Two SPILLS incidents occurred 420 feet and 500 feet west of the LOD, respectively. Both releases are believed to be crossgradient of the LOD. In addition, the Bowie Trucking Service was flagged for having active USTs; however, this facility was determined to be located 1,900 feet to the south (downgradient). Thus, impacts to the LOD are unlikely based on the crossgradient and downgradient proximity of the sites relative to the LOD.</p>
<i>PAX-0061</i>	<p>The LOD is located along the south side of Central Avenue (MD 214), west of Church Road, in Kettering, Maryland. The surrounding area is primarily residential and forested land, with the exception of the Evangel Cathedral church located directly south of the LOD. The surrounding area was primarily vacant agricultural land up until 1993, when development associated with the church began. The surrounding area was observed to be developed in its current configuration by approximately 2006. No records of concern were identified during this environmental review.</p>
<i>PAX-0062</i>	<p>The LOD is located along the north side of Central Avenue (MD 214), east of Danfield Road/Jared Road, in Kettering, Maryland. The surrounding area is primarily residential and vacant forested land. Based on a review of historical imagery, the surrounding area was primarily agricultural and forested land up until 1993, when development began. The surrounding area was observed to be developed in its current configuration by approximately 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-0063	<p>The LOD is located along the north side of Central Avenue (MD 214), west of Devonwood Drive/Jennings Mill Drive, in Kettering, Maryland. The surrounding area is primarily developed with residential properties, with the exception of a shopping center to the east of the LOD. The surrounding area was agricultural land up until 1993, when residential development was observed to have begun. Much of the surrounding area was developed in its current configuration by 2005. The shopping center to the northeast is believed to have been constructed between 2009 and 2013. Three petroleum release incidents were identified. The first incident, a release of 10 gallons of diesel fuel on the road surface about 85 feet from the LOD, occurred at the intersection of Central Avenue and Devonwood Drive. The release was cleaned up with sorbent dust, and the case closed. The second incident, a release of approximately 1 gallon of heating oil, approximately 260 feet south of the LOD, occurred during overfilling of a residential heating oil tank. The third incident, located 465 feet from the LOD and occurring in 1990, was closed 14 days after the date of incident. Based on the local topography, these sites are believed to downgradient of the LOD. Based on the quantities involve, and inferred hydraulic gradient, impacts to the LOD from these incidents are unlikely.</p>
PAX-0064	<p>The LOD is located along the south side of Central Avenue (MD 214), east of Devenwood Drive/Jennings Mill Drive, in Kettering, Maryland. The surrounding area is primarily developed with residential properties. The surrounding area was primarily vacant agricultural land up until 1993, when residential development began to occur in the area. Much of the surrounding area was developed in its current configuration by 2005. The shopping center to the northeast is believed to have been constructed between 2009 and 2013. One spill and one OCP cases were identified in close proximity of the LOD. Further information is needed to determine if any impacts to the LOD are present. Three petroleum release incidents were identified. The first incident, a release of 10 gallons of diesel fuel on the road surface about 135 feet from the LOD, occurred at the intersection of Central Avenue and Devonwood Drive. The release was cleaned up with sorbent dust, and the case closed. The second incident, a release of approximately 1 gallon of heating oil approximately 270 feet from the LOD, occurred during overfilling of a residential heating oil tank. The third incident, is located on the adjoining parcel to the south of the LOD, occurring in 1990 and closed 14 days after the date of incident. Based on the local topography, these sites are believed to be either crossgradient or downgradient of the LOD. Based on the quantities involve, and inferred hydraulic gradient, impacts to the LOD from these incidents are unlikely.</p>
PAX-0076	<p>The LOD is located along the central median of Central Avenue (MD 214), east of the intersection of Jennings Mill Drive, in Bowie, Maryland. The eastern portion of the LOD extends south across Central Avenue. The surrounding area is primarily residential, with some commercial and forest areas. The surrounding area was historically agricultural, with residential development starting in the 1980's and commercial development in the 2010's. Two OCP cases, one SPILLS case and one ERNS case was identified. The closest incident was an OCP case located 150 feet from the LOD, and is believed to be crossgradient of the LOD, based on the local topography. The case was opened and closed in February 1990, but no other info was available. The remaining incidents occurred at distances of 395 feet to 625 feet from the LOD, and believed to be either crossgradient or downgradient of the LOD. Based on the quantities involve, and inferred hydraulic gradient, impacts to the LOD from these incidents are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-0080</i>	<p>The LOD is located along the central median of Crain Highway (US Route 301), south of Peach Street, in Bowie, Maryland. The surrounding area is mixed use residential, commercial and open land. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural and rural residential through the 1970s when increased residential development began to the west of the LOD. Residential development continued through the early 2000s when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
<i>PAX-0301</i>	<p>The LOD is located along the western side of Largo Road (MD 202), between Old Largo Road and Water Fowl Way, in Upper Marlboro, Maryland. The area to the west of the LOD is observed to be primarily agricultural, which has been since at least 1959. The area to the east of the LOD was primarily undeveloped woodlands until the early 2000's when residential development started to occur. The surrounding area was observed to be developed in its current configuration in 2005. The adjacent facility to the west was listed on the UST and OCP databases. A 500-gallon gasoline UST and a 1,000-gallon heating oil UST were removed in 1995. No reports of a release were noted. An OCP case was also opened in 1993 for unknown reasons, but was closed one month later. Although adjacent to the LOD, this facility is situated on a large plot of land. The closest structure to the LOD, which is the minimum distance where the USTs and operations would have occurred, is approximately 1,170 feet away. Based on this distance, impacts to the LOD from this facility are unlikely.</p>
<i>PAX-0302</i>	<p>The LOD is located along the western side of Largo Road (MD 202), south of the intersection with Old Largo Road, in Upper Marlboro, Maryland. The area to the west of the LOD is observed to be primarily agricultural, which has been since at least 1959. The area to the east of the LOD was primarily undeveloped woodlands until the early 2000's when residential development started to occur. The surrounding area was observed to be developed in its current configuration in 2005. The adjacent facility to the west was listed on the UST and OCP databases. A 500-gallon gasoline UST and a 1,000-gallon heating oil UST were removed in 1995. No reports of a release were noted. An OCP case was also opened in 1993 for unknown reasons, but was closed one month later. Although adjacent to the LOD, this facility is situated on a large plot of land. The closest structure to the LOD, which is the minimum distance where the USTs and operations would have occurred, is approximately 930 feet away. Based on this distance, impacts to the LOD from this facility are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-0304</i>	<p>The LOD is located along the eastern side of Largo Road (MD 202), west of Old Largo Road, in Upper Marlboro, Maryland. The closest structure to the LOD, which is the minimum distance where the USTs and operations would have occurred, is approximately 1,095 feet away. Based on this distance, impacts to the LOD from this facility are unlikely.</p>
<i>PAX-0308</i>	<p>The LOD is located along the central median of Crain Highway (US Route 301), north of Leeland Road, in Upper Marlboro, Maryland. Commercial properties are located north, west and southwest of the LOD, and agricultural and forested areas to the south and east. The surrounding area was observed to be primarily agricultural land prior to commercial development beginning in late 1990's through mid-2010's. The surrounding area was observed to be developed in its current configuration in 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-0310</i>	<p>The LOD is situated along the eastern side of Crain Highway (US Route 301), north of the intersection with Leeland Road, in Upper Marlboro, Maryland. Commercial properties are located north and west of LOD, and agricultural and forested areas to the south and east. The surrounding area was observed to be primarily agricultural land prior to commercial development beginning in late 1990's through mid-2010's. The surrounding area was observed to be developed in its current configuration in 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-0311	<p>The LOD is situated along the eastern side of Crain Highway (US Route 301), north of the intersection with Leeland Road, in Upper Marlboro, Maryland. Commercial properties are located north and west of the LOD, and agricultural and forested areas to the south and east. The surrounding area was observed to be primarily agricultural land prior to commercial development beginning in late 1990's through mid-2010's. The surrounding area was observed to be developed in its current configuration in 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-0312	<p>The LOD is located along the western side of Crain Highway (US Route 301), north of the intersection with Leeland Road, in Upper Marlboro, Maryland. Commercial properties are located north and west of the LOD, and agricultural and forested areas to the south and east. The surrounding area was observed to be primarily agricultural land prior to commercial development beginning in late 1990's through mid-2010's. The surrounding area was observed to be developed in its current configuration in 2018. The commercial property to the west, The Safeway Warehouse, was listed in Maryland FINDS/FRS database for having an air permit, being a conditionally exempt small quantity generator, and having a risk management plan. In addition, a SPILLS incident involving the release of 75 to 100 gallons of diesel occurred in 2019. The spill was cleaned up with the assistance of the local fire department using absorbent dust and pads. An additional SPILLS incident, a release of 25 gallons of diesel to the roadway along Leeland Road in 2016, went into a storm drain that led to a retention pond on the Safeway Warehouse property. An environmental response contractor was hired to address the release. The closest retention pond on the Safeway Warehouse property to the LOD is over 1,000 feet away. Based on this distance of these release incidents from the LOD, impacts to the LOD are unlikely.</p>
PAX-0313	<p>The LOD is located along the western side of Crain Highway (US Route 301), north of Beech Tree Parkway/ Swanson Road, in Upper Marlboro, Maryland. Forested land and a golf course are located north of the LOD; forested land, a golf course and a large residential subdivision to the west and southwest of the LOD; a hotel and church to the south; and agricultural lands and residential properties to the east of the LOD. The surrounding area was primarily agricultural up until the 1960's, when development began to occur. The surrounding area was observed to be developed in its current configuration around 2007. One record, an ERNS site associated with a release of 0.5 gallons of heating oil due to equipment failure, was mapped as being 189 feet from the LOD. However, further evaluation of this site identified the property to actually be 580 feet from the LOD. Based on the distance and amount reportedly released, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-0315	<p>The LOD is located along the western side of Crain Highway (US Route 301), south of Beech Tree Parkway/Swanson Road, in Upper Marlboro, Maryland. The southern end of the LOD extends east, across Crain Highway. Forested land and a golf course are located north and west of the LOD; a hotel and forested lands to the south of the LOD. The surrounding area was primarily agricultural up until the 1960's, when development began to occur. The surrounding area was observed to be developed in its current configuration around 2007. The hotel was identified in the environmental database reported as having a former UST and associated OCP case. In December 2003, a 2,000-gallon heating oil UST was removed from the site. A release was reported to have not occurred. In April 2004, a leak from a heating oil AST of unknown volume occurred. Cleanup activities were reported to have occurred and the case was closed 2 months later. The site was listed as being 210 south of the LOD; however, after further review the site is approximately 300 south of the LOD. Based on the local topography, the site is believed to be downgradient of the LOD. Based on this, impacts to the LOD are unlikely from this facility. Three other facilities were identified in the database; however, further evaluation determined these facilities to be incorrectly mapped as being near the LOD. Actual distances of these facilities to the LOD ranged between 800 and 1,100 feet. Thus, impacts from these sites are unlikely based on their distance.</p>
PAX-0601	<p>The majority of the LOD is located along the western side of Woodyard Road (MD 223), north of the intersection of Welshire Drive, in Clinton, Maryland. The surrounding area includes residential properties to the west, and agricultural and forest to the east. The surrounding area was historically agricultural when residential development began in the 1980s, which continue through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-0602	<p>The LOD is located along the western side of Woodyard Road (MD 223), south of the intersection of Welshire Drive, in Clinton, Maryland. The surrounding area includes residential properties to the west, and agricultural and forest to the east. The surrounding area was historically agricultural when residential development began in the 1980s, which continue through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-0608	<p>The LOD is located along the southern side of Kendalwood Drive, west of Croom Road (MD 382), in Upper Marlboro, Maryland. The western portion of the LOD extends north across Kendalwood Drive. The surrounding area primarily consists of low-density residential development and forested land, with the exception of a church to the east. The surrounding area was historically agricultural when residential development began in the 1960s, which continue through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-0610	<p>The LOD is located along the eastern side of Woodyard Road (MD 223), north of Dower House Road, in Woodyard, Maryland. The surrounding area is primarily residential properties with some commercial and institutional properties along Woodyard Road. The LOD and surrounding area was primarily agricultural up until the 1980's, when residential development began. The surrounding area was observed to be developed in its current configuration around 2007. A former gas station is located approximately 145 feet west of the LOD. In 1996, one 8,000-gallon gasoline UST, one 6,000-gallon gasoline UST, two 2,000-gallon gasoline USTs, one 550-gallon kerosene UST, and one 550-gallon used oil UST were excavated and removed from the site in February 1996. Substantial amounts of impacted soil and free product were observed in the kerosene excavation pit on the southwest side of the site, as well as in the excavation pit that had contained the two 2,000-gallon gasoline USTs, in the north-central portion of the site. Based on additional sampling onsite and offsite, elevated levels of TPH, MTBE, BTEX were identified in the soil and groundwater onsite. Groundwater modeling inferred that a groundwater plume extended to the north, into the southern portion of property directly east of the site and west of the LOD, with concentrations of benzene, toluene, ethylbenzene, and xylenes all detected above their laboratory detection limits. Based on available reports, the local hydraulic gradient is believed to be to the northeast, crossgradient of the LOD. A pump and treat system was installed in approximately 1997 and continued to be operated until approximately May 1998. The seven onsite permanent monitoring/ recovery wells were sampled gauged monthly and then quarterly up until March 2000, when detected concentrations of TPH and BTEX were found to have substantially decreased. In August 2000, MDE granted no further action to the site. Based on the information summarized above it is believed that any impacted soil and/or groundwater is isolated to the area around the former gas station or to the north/northeast of the site, and west (crossgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>
PAX-0616	<p>The LOD is located along the central median of Southern Maryland Boulevard (MD 4), east of Plummer Lane, in Lothian, Maryland. A portion of the LOD extends north, across the roadway. The surrounding area is a mix of rural agricultural land, vacant land, and forested land. The surrounding area is observed to be in its current configuration by 2005. One record of concern was identified in the environmental data base report. A SPILLS case involving the discovery of a 55-gallon drum of unknown substance and a 30-gallon drum of waste oil was identified approximately 150 feet of the LOD; however, after further review, the incident is believed to have occurred approximately 1,250 feet to the northeast of the LOD. Thus, impacts to the LOD are unlikely.</p>
PAX-0618	<p>The LOD is located along the central median of Crain Highway (US Route 301), southwest of the intersection with Old Crain Highway, in Upper Marlboro, Maryland. A high voltage transmission ROW cuts across the northeastern portion of the LOD. The surrounding area is comprised of commercial and residential properties intermixed with agricultural and forested areas. The area was primarily agricultural and forested land up until 2005, when residential development began to the north. The surrounding area was observed to be developed in its current configuration in 2009. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-0620</i>	<p>The LOD is located along the central median of Southern Maryland Boulevard (MD 4), northwest of the intersection with W Bay Front Road, in Lothian, Maryland. The northwest portion of the LOD extends north, across MD 4, to the northern service road. The surrounding area is primarily forested with a few residential structures south of the LOD. As early as the 1930's, the surrounding areas was used for agricultural purposes. Over time, the forest lands reclaimed the agricultural lands, and the surrounding area was observed in its current configuration by 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-0621</i>	<p>The LOD is located along the central median of Southern Maryland Boulevard (MD 4), northwest of the intersection with W Bay Front Road, in Lothian, Maryland. The northwest portion of the LOD extends south, across MD 4, to forested land. The surrounding area is primarily forested with a few residential structures south of the LOD. As early as the 1930's, the surrounding areas was used for agricultural purposes. Over time, the forest lands reclaimed the agricultural lands, and the surrounding area was observed in its current configuration by 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-0622</i>	<p>The LOD is located along the central median of Southern Maryland Boulevard (MD 4), south of the intersection with W Bay Front Road, in Lothian, Maryland. The surrounding area is comprised of commercial and residential properties intermixed with agricultural and forested areas. The area was primarily agricultural and forested land up until 2005, when residential development began to the north. The surrounding area was observed to be developed in its current configuration in 2013. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-0624</i>	<p>The LOD is located along the north side of W Bay Front Road (MD 258), immediately east of McKendree Road, in Lothian, Maryland. The surrounding area is primarily rural agricultural land with some residential properties. The surrounding area has been primarily used for agricultural purposes since at least 1954, and is observed in its current configuration by 1993. Three records of concern were identified in the environmental database report, with the closest being a former UST site believed to be approximately 230 feet upgradient or crossgradient of the LOD. According to available records, a 1,000-gallon diesel fuel UST, was removed in 1992. No records stating a release occurred was noted. Thus, impacts to the LOD from this former UST are unlikely. The remaining two records, a HMIRS/SPILLS site and a UST/OCP site, are both believed to be located between 295 and 505 feet downgradient of the LOD. Thus, impacts to the LOD are unlikely based on the distances of these sites.</p>
<i>PAX-0625</i>	<p>The LOD is located along the northern side of W Bay Front Road (MD 258), between Anthony Court and Dawn Drive, in Lothian, Maryland. The surrounding area is semi-rural with residential properties. The surrounding area was historically agricultural, starting prior to 1953. Residential development in the surrounding area continued to approximately 2005, when the surrounding area was observed to be developed in its current configuration. Four sites were identified in the environmental database report. Of those four sites, only two sites had listings associated with petroleum USTs or reported releases; however, the two sites are believed to be at least 370 feet downgradient of the LOD. Thus, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-0626	<p>The LOD is located along the south side of W Bay Front Road (MD 258), east of Iron Stone Road, in Lothian, Maryland. The surrounding area is semi-rural with residential properties. The surrounding area was historically agricultural, starting prior to 1953. Residential development in the surrounding area continued to approximately 2005, when the surrounding area was observed to be developed in its current configuration. Three sites were identified in the environmental database report. Of those three sites, only two sites had listings associated with petroleum USTs or reported releases; however, the two sites are believed to be at least 475 feet downgradient or crossgradient of the LOD. Thus, impacts are unlikely.</p>
PAX-0641	<p>The LOD is located along the central median of Crain Highway (US Route 301), north of Trumps Hill Road, in Upper Marlboro, Maryland. Forested lands are located to the west, and residential dwellings are located to the east. A utility ROW (powerlines) runs northwest/southeast, crossing Crain Highway just south of the LOD. Development to the east was observed to begin around the early 1980s and continued through the 2010s, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-0951	<p>The LOD is located along the east side of Croom Road (MD 382), north of Molly Berry Road, in Upper Marlboro, Maryland. The area surrounding the LOD is mostly rural agricultural and forest land, with residential structures and farms to the northeast and south. No substantial changes to the surrounding are noted since the 1960s. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-0961	<p>The LOD is located along the central median of Crain Highway (US Route 301), south of Frank Tippet Road, in Cheltenham, Maryland. The surrounding area is primarily residential properties, forested land, as well as cemetery to the west and retail structures to the north. The surrounding area was primarily rural agricultural land up until the 1980s, when development began to occur to the west, including the construction of a cemetery to the west. The surrounding area was observed to be developed in its current configuration around 1993. The cemetery was identified in the environmental database for having former USTs. During removal of a 1,000-gallon heating oil UST, impacted subsurface media was encountered. The material was remediated and the case was closed. The anticipated location of the former USTs is approximately 605 feet from the LOD. Further, the cemetery is anticipated to be hydraulically downgradient of the LOD. Based on this, impacts to the LOD from the cemetery are unlikely. A convenience store located approximately 635 feet to the northeast (crossgradient) that previously had petroleum USTs located on the property. There are no records of releases associated with the former UST. Thus, impacts from these sites are unlikely based on their downgradient and crossgradient proximity to the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-0965	<p>The LOD is located along the west side of Crain Highway (US Route 301), north of Cherry Tree Crossing Road, in Cheltenham, Maryland. The surrounding area includes residential properties, forested land, a cemetery and retail structures. The surrounding area was primarily rural agricultural land up until the 1980s, when development began to occur to the west, including the construction of the cemetery. By 1993, the surrounding area is observed to be developed in its current configuration. The cemetery was identified in the environmental database for having former USTs. During removal of a 1,000-gallon heating oil UST, impacted subsurface media was encountered. The material was remediated and the case was closed. The anticipated location of the former USTs is approximately 665 feet from the LOD. Further, the cemetery is believed to be hydraulically downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
PAX-1204	<p>The LOD is located along the central median of Southern Maryland Boulevard (MD 4), north of Bright Lane, in Owings, Maryland. The surrounding area is composed primarily of agricultural and forested land, with residential properties further to the east and south. Residential development was observed to begin in the early 1980s, which continued through approximately 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-1205	<p>The LOD is located along the west side of Chesapeake Beach Road (MD 260), south of Kidwell Lane, in Owings, Maryland. The surrounding area is semi-rural area with residential dwellings and commercial structures intermixed throughout. Residential development was observed to begin in the early 1960s, which continued through approximately 2005, when the surrounding area was observed to be developed in its current configuration. Two OCP cases were identified in the environmental database report. Based on available information both cases have received closure from MDE and the sites are believed to be over 500 feet crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
PAX-1206	<p>The LOD is located along the east side of Chesapeake Beach Road (MD 260), northwest of Solomons Island Road (MD 2), in Owings, Maryland the surrounding area is semi-rural area with residential dwellings and commercial structures intermixed throughout. Residential development was observed to begin in the early 1960s, which continued through approximately 2005, when the surrounding area was observed to be developed in its current configuration. An OCP case associated with a residential property approximately 130 feet to the northeast was opened for the closure and removal of a residential heating oil UST in 1997. Available records state that no release occurred and cleanup/remediation was not required. The case was closed approximately 2 years later in 1999. A second OCP case associated with a residential property approximately 340 feet to the southwest, was opened for a leaking residential heating oil AST. The OCP case was closed within one month. Based on local topography this OCP cases are believed to be either crossgradient or downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-1209	<p>The LOD is located on the east side of Solomons Island Road (MD 2), north of Skinners Turn Road (MD 765), in Owings, Maryland. The surrounding area is mainly forested land and residential properties. The area was primarily developed as agricultural land up until the 1960s, when residential development began to occur and forests reclaimed the farmland. Development continued up until approximately 2005, when the surrounding area was observed to be developed in its current configuration. One site was identified in the environmental database report. An OCP case associated with a property approximately 460 feet to the northeast, was opened in 1995 for the closure of a UST. Available records did not state whether or not a release occurred or clean-up was required. The case was closed approximately four months later. Based on local topography the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
PAX-1210	<p>The LOD is located along the west side of Solomons Island Road (MD 2), north of Grovers Turn Road (MD 778), in Owings, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the surrounding area was developed at agricultural land up until approximately 1953, when residential development began to occur. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified during this environmental review.</p>
PAX-1211	<p>The LOD is located along the western side of Solomons Island Road (MD 2), east of Main Street, in Huntingtown, Maryland. The surrounding area is primarily residential properties and forested land. A municipal park is located to the east of the LOD. Residential development occurred to the west up until the 1980s. The surrounding area was observed to be developed in its current configuration by 1993. Three closed OCP cases with documented releases and cleanup/ remediation conducted were identified between 325 and 480 feet to the west of the LOD; however, based on the local topography, the sites are believed to be downgradient of the LOD. Three additional sites were also identified in the environmental database report; however, the environmental listings were not indicative of a release to the environment or were 400 feet downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
PAX-1213	<p>The LOD is located along the central median of Southern Maryland Boulevard (MD 4), north of Camaleer Pass and south of Lord Baltimore Drive, in Owings, Maryland. The surrounding area is primarily agricultural land, residential and undeveloped woodlands. The surrounding area was primarily undeveloped up until the 1980s, when residential and some commercial development began. Development continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-1502</i>	<p>The LOD is located along the central median of Three Notch Road (MD 5), south of Carpenter Lane, in Charlotte Hall, Maryland. The surrounding area consists of commercial development and forest; with a dentist, cabinetry business, and farm stand located directly adjacent to LOD. The surrounding area was primarily agricultural up until the 1970s, when commercial development began, and continued through 2006, when the surrounding area was observed to be development similar to its current configuration. The cabinetry business, Cords Carpentry, is a RCRA SQG, with no violations on record. Two other sites were identified in the environmental database search for having NPDES permits; however, impacts to the LOD are unlikely based on the nature of the listings.</p>
<i>PAX-1504</i>	<p>The LOD is located on the west side of Aquasco Road (MD 381), approximately 2,500 feet south of Christ Church Road, in Aquasco, Maryland. The southern end of the LOD extends east, across Aquasco Road. The surrounding area is observed to be undeveloped forest and agricultural fields. Based on a review several structures and agricultural field were present along Aquasco Road up until the 1980s, when forests were observed to reclaim the farmland and the structures had been demolished. No substantial changes to the surrounding area were observed since 1980, based on a review of available historical imagery. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-1509</i>	<p>The LOD is located along the central median of Three Notch Road (MD 5), north from the intersection with Carpenter Lane in Charlotte Hall, Maryland. The surrounding area consists of commercial development and forest; with a shed sales business to the northeast, a farm supply store to the west, shopping center to the northeast, dumpster and U-Haul rentals to the east, dentist to the southwest, and cabinetry business to the southeast. These businesses were developed in the 1970's to 2000's. A FINDS/FRS record for a gas station 185 feet to the north was identified, however, based on further review the site is not located in the vicinity of the LOD. Cords Carpentry to the southeast is a RCRA SQG, with no violations or record, it presents a low risk site. Two other sites were identified in the environmental database search for having NPDES permits. Thus, impacts are unlikely based on the nature of the environmental listings identified in the vicinity of the LOD.</p>
<i>PAX-1510</i>	<p>The LOD is located along the east side of Hallowing Point Road (MD 231), south of Calvert Fair Drive, in Prince Frederick, Maryland. A gas station is located approximately 450 feet south (crossgradient) of the LOD. An autobody shop was mapped approximately 150 feet to the north of the LOD; however, after further review, the site is actually 450 feet away to the south (downgradient) and presents no risk. An OCP case was opened in 2012, at a property approximately 75 feet to the west of the southern portion of the LOD, beyond Hallowing Point Road after a pickup truck overturned releasing an unknown amount of diesel onto the lawn of the property and impacted an approximately 10 foot by 30 foot area of grass. PID readings from the area were recorded between 25 and 78 ppm. The area was excavated approximately 4-6 inches bgs, graded with topsoil from offsite and reseeded. The case was closed shortly thereafter. Since the impacted area was mostly surficial and approximately 75 feet to the west, beyond Hallowing Point Road, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-2001</i>	<p>The LOD is located in the southwest corner of the intersection of Greenbelt Road (MD 193) and Good Luck Road, in Lanham, Maryland. Duval High school is located directly to the south, the Goddard Space Flight Center to the north, and residential and commercial development to the east. The area developed gradually from the 1960's to the 2000's. Eight nearby facilities were listed on various environmental databases, including OCP, SPILLS and FINDS; however, all records of concern are believed to be at least 470 feet or greater crossgradient or downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
<i>PAX-2005</i>	<p>The LOD is located on the north side of John Hanson Highway (US Route 50) at the intersection with Lottsford Vista Road, in Bowie, Maryland. Based on historical imagery, the surrounding area was primarily agricultural and forested land up until the 1960s, when single family residential properties began to be developed to the south, an office park to the northwest was developed in the 1980's, and multifamily residential complexes to the northeast were developed in the 1990's. The surrounding area was observed to be developed in its current configuration around 2009. Two RCRA generators, were identified between 595 feet and 640 feet northwest of the LOD, neither of which had reported violations. Based on these distances, impacts to the LOD are unlikely.</p>
<i>PAX-2006</i>	<p>The LOD is located along the south side of John Hanson Highway (US Route 50), west of Lottsford Vista Road, in Bowie, Maryland. Based on historical imagery, the surrounding area was primarily agricultural and forested land up until the 1960s, when single family residential properties began to be developed to the south, an office park to the northwest was developed in the 1980's, and multifamily residential complexes to the northeast were developed in the 1990's. The surrounding area was observed to be developed in its current configuration around 2009. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2007</i>	<p>The LOD is located along the south side of John Hanson Highway (US Route 50), east of the Folly Branch overpass, in Bowie, Maryland. Based on historical imagery, the surrounding area was primarily agricultural and forested land up until the 1960s, when residential development began to occur. Residential development continued through the 1990s, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2008</i>	<p>The LOD is located along the north side of John Hanson Highway (US Route 50), west of the Enterprise Road overpass, in Bowie, Maryland. Based on historical imagery, the surrounding area was primarily agricultural and forested land up until the 1980s, when residential development began to occur. Residential development continued in directions of the LOD through the mid-1990s, when the surrounding area was observed to be developed in its current configuration. An OCP case was opened for an unknown reason at a residential property approximately 535 feet north of the LOD. Based on the local topography, the site is believed to be upgradient of the LOD; however, available records state that no release had occurred and not cleanup/remediation was required. The case was closed approximately 3 months later. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-2009</i>	<p>The LOD is located along the eastern side of Enterprise Road (MD 193), immediately south of Belvidere Road, in Bowie, Maryland. The surrounding area is primarily residential. The surrounding area was primarily agricultural and scattered residential properties as early as 1961. Additional residential development was observed to the south in early 1970s. Residential development continued to the east, west, and south through the early 1980s, when the surrounding area was observed to be developed in its current configuration. The John Hanson Highway (US Route 50) overpass, located approximately 625 feet to the north, was listed on the RCRA LQG and SPILLS databases. The overpass is most likely listed as an LQG for lead most likely generated from lead-abatement during bridge rehabilitation. In 2014, a release of 30 gallons of diesel fuel due to an overturned tanker truck. The Prince George's Hazardous Materials Department was mobilized. In 2017, a release of two gallons of gasoline occurred due to a vehicle accident. Prince George's Fire Department was mobilized, which used absorbent dust to address the spill; however, based on the distance, impacts to the LOD are unlikely.</p>
<i>PAX-2010</i>	<p>The LOD is located along the east side of Enterprise Road (MD 193), south of the intersection with Marleigh Drive, in Bowie, Maryland. The surrounding area is primarily residential. Up until the 1980s, the surrounding area was primarily agricultural and forested land, when residential development began to the west of the LOD. Residential development to the east was observed to begin in the 2000s. The surrounding area was observed to be developed in its current configuration around 2005. occurred in the 1980's, and east of the LOD in the 2000's. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2012</i>	<p>The LOD is located along the west side of Glenn Dale Road (MD 953), north of the intersection with Atwell Ave, in Bowie, Maryland. The LOD is surrounded by residential developments, with the closest residential developments occurring in the 2000s (west of LOD) and the early 1990s (east of LOD). In addition, a shopping center complex constructed in the 1990s is located to the northeast. Prior to the 1990's, the surrounding area was observed to be primarily agricultural and forested land. The shopping center was flagged as having a drycleaner (no violations) as well as a SPILLS incident involving sewage only. Further evaluation identified that the dry cleaner is located further back in the shopping center plaza, increasing the distance from the LOD to just over 400 feet. Based on the local topography, the site is believed to crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
<i>PAX-2013</i>	<p>The LOD is located along the west side of Enterprise Road (MD 193), north of the intersection with Meadowland Drive, in Bowie, Maryland. Residential developments are located to the north, west and south, while a wooded area is to the east. The surrounding area was observed to be primarily agriculture land up until the 1960s, when residential development began, and continued through the 2000's, when the surrounding area was observed to be developed in its current configuration; no violations were identified during this review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-2015</i>	<p>The LOD is located along the west side of Annapolis Road (MD 450), between Sir Walter Drive and Sir Lancelot Drive, in Glenn Dale, Maryland. A large shopping center is located to the south, while single-family residential developments are present in all other directions. The surrounding area was agriculture up until the 1960s, when residential development to the west and northwest began to occur through the 1980s. of the LOD occurred mostly in the 1960's and 1980's, while residential development to the southwest and east and the shopping center to the south occurred in the 2000's, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2016</i>	<p>The LOD is located along the south side of Lanham Severn Road (MD 564), east of Santa Cruz Street, in Lanham, Maryland. The LOD is directly west of Lanham Skate Center. The area north of LOD is primarily residential; developed by 1960; the area to the southwest is primarily commercial properties, developed in the 1970's-1980's; the area to the west and east of the LOD is forested land. South of the commercial area is a railroad line, followed by residential development. Three sites were identified in the environmental database search, including two RCRA SQGs with no violations located 400-500 feet from the LOD, as well as an OCP/UST site approximately 595 feet to the southwest that had a reported release/cleanup from a single UST. All three sites are believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
<i>PAX-2018</i>	<p>The LOD is located along the west side of Laurel Bowie Road (MD 197), north of Rach Track Road, in Bowie, Maryland. The surrounding area is primarily forested with some residential structures to the west. Residential development began prior to 1964, and the surrounding area is observed in its current configuration by 2005. One record of concern, an OCP and UST site located 475 feet to the west, has soil contamination that was identified during removal of a 550 gallon heating oil UST. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
<i>PAX-2019</i>	<p>The LOD is located along the western side of Laurel Bowie Road (MD 197), across from the intersection with Jericho Park Road, in Bowie, Maryland. The surrounding area is mainly forest to the west, south and east, while the Bowie State College is to the north and northeast. Construction of the college began prior to 1964 and several expansions have occurred since. The surrounding area is observed to be in its current configuration by 2011. Bowie State College was listed on the OCP, UST, FINDS/FRS databases. Four OCP cases were opened, two of which involved cleanup efforts, and fourteen USTs were previously registered as being present. While the college was mapped as being 335 feet from the LOD, based on the size of the campus, these cases are likely located significantly further. In addition, based on local topography the campus is located downgradient from the LOD. Two other sites with OCP cases and reported spills in the vicinity of the LOD, were identified in the environmental database report; however, after further review, the sites were over 1,400 feet from the LOD. Thus, impacts to the LOD from the college campus and other sites are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-2020</i>	<p>The LOD is located along the western side of Laurel Bowie Road (MD 197), north of the intersection with Jericho Park Road, in Bowie, Maryland. The surrounding area is primarily forested land. MD 197 is observed to be completed by 1993, with no other development in the vicinity of the LOD since. A minor spill incident of 5 gallons of hydraulic oil occurred 605 feet to the south, which was subsequently addressed. The remaining records appear to be associated with a landfill located approximately one mile to the west. Thus, impacts to the LOD are unlikely.</p>
<i>PAX-2021</i>	<p>The LOD is located on the east side of 9th Street, north of 11th Street, and south of a railroad, in Bowie Maryland. Based on aerial photographs the portion of the LOD consists of the northbound lane of 9th St., mostly grassy land to the east of the street, and a pedestrian walkway connecting from 9th Street to nearby 10th Street. The area surrounding the LOD is mostly residential, with some commercial located along Chestnut Avenue. The area was mostly developed by the 1930's; the LOD was developed into existing condition along with the construction of 9th Street in the late 1990's or early 2000's. Several buildings, likely residential, were located within the LOD and demolished by 1993. Eight closed UST/OCP sites were identified around the LOD. Seven of the sites were found to be either upgradient/crossgradient of the LOD, no releases/ remediation was required, and are not believed to have impacted the LOD. Other low risk sites included a RCRA SQG with no violations and a restaurant that holds an active air permit. One OCP case was identified directly west of the southern portion of the LOD. According to available information provided by MDE through a PIA request, a 550-gallon gasoline UST was excavated and removed from the site in 1993. No staining or odors were observed in the soils in the excavation, as well as PID readings were recorded at 0.0 ppm. A soil sample was collected and analyzed for TPH, naphthalene, and BTEX, which were all non-detect with the exception of a detected concentration of naphthalene at 0.003 mg/kg. Based on the analytical data, MDE granted closure to the site approximately 7 months later. Thus, impacts to the LOD are unlikely.</p>
<i>PAX-2501</i>	<p>The LOD is located along the interchange from westbound Sandy Spring Road (MD 198) and southbound I-95, in Laurel, Maryland. The area surrounding the LOD was observed to be primarily forested and agricultural land up until 1971, when MD 198 and I-95 were first observed. With the exception of forested areas returning following MD 198 and I-95 construction, the area has remained relatively unchanged since at least 1971. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2502</i>	<p>The LOD is located along the south bound onramp of I-95 from Sandy Spring Road (MD 198), in Laurel, Maryland. The area surrounding the LOD was observed to be primarily forested and agricultural land up until 1971, when MD 198 and I-95 were first observed. With the exception of forested areas returning following MD 198 and I-95 construction, the area has remained relatively unchanged since at least 1971. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-2509</i>	<p>The LOD is located along the south side Sandy Spring Road (MD 198), east of I-95, in Laurel, Maryland. The surrounding area was primarily agricultural and forested land with residential properties dispersed throughout up until 1971, when MD 198 was observed. Residential development was observed to the southeast in the 1990s. The surrounding area was observed to be developed in its current configuration around 2007. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2510</i>	<p>The LOD is located along the south side Sandy Spring Road (MD 198), east of I-95, in Laurel, Maryland. The surrounding area was primarily agricultural and forested land with residential properties dispersed throughout up until 1971, when MD 198 was observed. Residential development continued up until approximately 2007, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2511</i>	<p>The LOD is located along the east side of I-95, north of Sandy Spring Road (MD 198), in Laurel, Maryland. The area surrounding the LOD was observed to be forested and agricultural land up until the 1960s, when I-95 was observed to have been constructed. Residential development in the area continued up until approximately 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2514</i>	<p>The LOD resides mainly within the central median of Sandy Spring Road (MD 198), west of the I-95 overpass, in Laurel, Maryland. Residential properties are observed to the north of the LOD and forested lands and a hotel parking lot to the south. The area was primarily agricultural with few residential properties until the late 1960s, when the area was cleared for the construction of I-95 and Sandy Spring Road. By 1989, the area was developed into current conditions. Two SPILLS incidents were identified in the vicinity of the LOD; a release of four ounces of oil approximately 95 feet to the north, and a release of approximately 10 gallons of gasoline 315 feet to the north. Both releases were surficial in nature and are believed to be crossgradient of the LOD. In addition, two UST/OCP sites were identified; one for the removal of a 550-gallon heating oil UST approximately 210 feet to the east, and one for the removal of two 4,000-gallon diesel fuel USTs, one 2,000-gallon gasoline UST and an unknown sized motor/lube oil tank approximately 380 feet to the east. Cleanup efforts were required at both of these UST/OCP sites; however, based on the local topography, both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD from these four sites are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-2515	<p>The LOD lies on the north side of Sandy Spring Road (MD 198), just west of the offramp from I-95 south in Laurel, Maryland. Residential properties are observed to the north of the LOD and forested lands and a hotel parking lot to the south. The area was primarily agricultural with few residential properties until the late 1960s when the area was cleared for the construction of I-95 and Sandy Spring Road. By 1989, the area was observed to be developed in its current configuration. Two SPILLS incidents were identified in the vicinity of the LOD; a release of four ounces of oil approximately 25 feet to the north, and a release of approximately 10 gallons of gasoline 255 feet to the north. Both releases were surficial in nature and are hydraulically crossgradient of the LOD. In addition, two UST/OCP sites were identified; one for the removal of a 550-gallon heating oil UST approximately 210 feet to the east, and one for the removal of two 4,000-gallon diesel fuel USTs, one 2,000-gallon gasoline UST and an unknown sized motor/lube oil tank approximately 385 feet to the east. Cleanup efforts were required at both of these UST/OCP sites; however, based on the local topography, both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD from these sites are unlikely.</p>
PAX-2516	<p>The LOD is located along the central median of I-95, north of the interchange with Sandy Spring Road (MD 198), in Laurel, Maryland. Residential properties are located throughout the area. The area was previously forested and cleared agricultural land up until the late 1960s, when I-95 was constructed. Residential development continued up until approximately 1989, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-2518	<p>The LOD is located along the central median of Sandy Spring Road (MD 198), west of the intersection with Van Dusen Road, in Laurel, Maryland. The area surrounding the LOD is densely populated with residential properties to the south and commercial properties to the north. The area was primarily forested land until the early 1970s, when Sandy Spring Road and residential properties to the south and west were constructed. The surrounding area was observed to be developed in its current configuration around 1981. Two OCP cases related to vehicular accidents occurred approximately 50 feet to the east, at the intersection of Sandy Spring Road and Van Dusen Road. Based on the descriptions, both likely were minimal releases to the impervious road surface only. An active gas station, located 275 feet to the northeast, is listed on the SPILLS, UST, and OCP databases. Three gasoline and one diesel UST exist. An OCP case was opened in 1993 for the removal of two used oil USTs. Release and cleanup efforts were noted, and the OCP case closed in 2000. In 2015, a hose failure released an unreported volume of gasoline to the surface. A dry cleaner was noted 387 feet to the north, which had no reported violations. An additional OCP case was noted 393 feet to the north, at a realty broker's office, for the removal of a 500-gallon heating oil UST that required subsequent cleanup efforts. The gas station, dry cleaner and realty broker sites are believed to be located hydraulically crossgradient from the LOD. Based on the hydraulic direction and the distances from the LOD, impacts to the LOD from the gas station dry cleaner and realty broker are unlikely. The remaining records are listed at sites 405 feet or greater from the LOD and therefore, are not expected to have an impact on the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-2519	<p>The LOD is located along the central median of Sandy Spring Road (MD 198), east of the I-95 overpass, in Laurel, Maryland. The surrounding area was primarily agricultural and forested land with residential properties dispersed throughout up until 1971, when MD 198 was observed. Residential development continued up until approximately 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
PAX-2520	<p>The LOD is located along the south side of Sandy Spring Road (MD 198), east of Van Dusen Road, in Laurel, Maryland. Residential properties are located to the south and commercial properties to north side. Sandy Spring Road was rerouted in the early 1970s to its current configuration, when residential and commercial development was also observed to begin. The surrounding area was observed to be developed in its current configuration around 1989. Four sites concern were identified in area surrounding the LOD. Two OCP cases related to vehicular accidents occurred approximately 90 feet to the west, at the intersection of Sandy Spring Road and Van Dusen Road. Based on the descriptions, both likely were minimal releases to the impervious road surface only. An active gas station, located 385 feet to the northeast (crossgradient), is listed on the SPILLS, UST, and OCP databases. Three gasoline and one diesel UST exist. An OCP case was opened in 1993 for the removal of two used oil USTs. Release and cleanup efforts were noted, and the OCP case closed in 2000. In 2015, a hose failure released an unreported volume of gasoline to the surface. A fourth OCP case was plotted approximately 510 feet to the east of the LOD; however, based on further review, the site is actually 730 feet to the northeast (downgradient) of the LOD. Based on the crossgradient/ downgradient proximity of the sites relative to the LOD, impacts are unlikely.</p>
PAX-2521	<p>The LOD lies to the south of Sandy Spring Road (MD 198), west of 11th Street and east of Van Dusen Road, in Laurel, Maryland. The area surrounding the LOD is densely populated with residential properties to the south and commercial properties to the north. The area was primarily forested land until the early 1970s, when Sandy Spring Road and residential properties to the south and west were constructed. The surrounding area was observed to be developed in its current configuration around 1981. Three OCP cases, one 580 feet to the north and the other two 630 feet to the west were identified in the environmental database report. The OCP case to the east was related to dumping; however, the records state that no release was identified and required no cleanup/ remediation. The case received closure approximately one week later. Two OCP cases related to vehicular accidents occurred approximately 50 feet to the east, at the intersection of Sandy Spring Road and Van Dusen Road. Based on the descriptions, both likely were minimal releases to the impervious road surface only. Based on the distance of these incidents in relation to the LOD, as well as type of incident, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-2522	<p>The LOD is located along the north side of Sandy Spring Road (MD 198), west of 11th Street, in Laurel, Maryland. The area surrounding the LOD is densely populated with residential properties to the south and commercial properties to the north. The area was primarily forested land until the early 1970s, when Sandy Spring Road and residential properties to the south and west were constructed. The surrounding area was observed to be developed in its current configuration around 1981. An OCP case related to dumping was listed at a site approximately 580 feet to the north of the LOD. Records state that no release was identified and therefore, required no cleanup/ remediation. The case was closed approximately 1 week later. Based on the distance and lack of release, impacts to the LOD are unlikely.</p>
PAX-2523	<p>The LOD is along the central median of Gorman Avenue (MD 198), west of 10th Street and east of 11th Street, in Laurel, Maryland. The area surrounding the LOD is primarily residential, with several commercial buildings further to the north. Residential development began to the south in the 1950s and continued to the north in the 1970s, when multi-family residential complexes were constructed. The LOD and surrounding area were observed to be developed in their current configuration in approximately 2005. A spill and OCP case associated with a residential property are listed approximately 485 feet to the west of the LOD. Based on available information, approximately 200 gallons of heating oil was released onto the ground from, due to a hole in an AST. An OCP case was opened in relation to this release in November 2016, that stated the impacted material was addressed, and the case was closed approximately two years later in June 2018. Based on local topography the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely based on the distance of the site.</p>
PAX-2524	<p>The LOD is located in the median of Gorman Avenue (MD 198), west of the intersection with 10th Street, in Laurel, Maryland. This area is primarily residential and has been since the 1960s. The surrounding area was observed to be developed in its current configuration around 1971. A SPILL incident that was eventually changed to an OCP case, occurred approximately 85 feet to the north of the LOD. The incident involved the release of approximately 200 gallons of heating oil from an AST onto the ground in 2016. A remediation contractor was mobilized who removed the leaking AST and approximately two tons of impacted soils. Excavation occurred until PID readings of less than 20 ppm were detected. A confirmatory soil sample was collected at the base of the excavation for laboratory analysis of TPH-DRO, TPH-GRO and VOCs. Analytical results were non-detect, except for TPH-DRO and xylenes; however, the detected concentrations were all well below the MDE Residential Soil Cleanup Objectives. The OCP case was closed in June 2018. Based on this information, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-2525</i>	<p>The LOD is located along the north side of Fort Meade Road (MD 198), east of Laurel Bowie Road (MD 197), in Laurel, Maryland. The area surrounding the LOD is developed primarily with commercial properties. The LOD and surrounding area was observed to be vacant land up until 1952, when Fort Meade Road is first observed to the south of the LOD. In 1971 the commercial properties to the north of the LOD were first observed. Commercial development in the area continued up until 2005 when the LOD and surrounding area were observed to be developed in their current configuration. Four sites within 120 to 420 feet of the LOD are listed at RCRA generators or have air permits (no violations). One apartment complex to the approximately 450 feet to southwest (downgradient) has an active 10,000-gallon heating oil UST and one 12,000-gallon heating UST that was excavated and removed from the site 1987. According to available records, no impacted material was encountered and/or cleanup/ remediation was required during the removal of the UST. Subsequently, the case was closed approximately 2.5 months later. Thus, impacts to the LOD are unlikely, since the USTs and associated apartment complex are believed to be downgradient of the LOD.</p>
<i>PAX-2540</i>	<p>The LOD lies along the north side of Fort Meade Road (MD 198), west of the intersection with Irving Street, in Laurel, Maryland. The area surrounding the LOD is mostly commercial properties. The LOD and surrounding area was agricultural and wooded areas starting from at least 1838. Fort Meade Road is first observed in 1952, and development of the commercial properties occurs from the 1971's through the mid-2000's. No records of concern that would have an impact on the LOD identified during this environmental review.</p>
<i>PAX-2559</i>	<p>The LOD lies within the median between the interchange lanes from Sandy Spring Road (MD 198), east- and westbound with I-95 southbound, in Laurel, Maryland. The surrounding area is commercial to the west of I-95, and primarily forest east of I-95. The area was agricultural and forested land up until the late 1960s when the area was cleared for the construction of I-95. Commercial development to the northwest was observed in the 2000s, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-2560</i>	<p>The LOD lies along the interchange from east-bound Sandy Spring Road (MD 198) to north bound I-95, in Laurel, Maryland. The area surrounding the LOD was primarily forested land with residential properties to the north. This land was cleared when I-95 was constructed in the 1970s. The Sandy Spring Road overpass of I-95 was listed twice on the RCRA LQG databases, both for lead generation, likely associated with lead abatement during maintenance events. Any historical lead leaching from the overpass would not have been directed towards the LOD. In addition, three OCP cases were listed at the intersection of Sandy Spring Road and I-95. Two of the OCP cases were listed as vehicle accidents, while the third did not state but is presumed to also be a vehicle accident. One OCP vehicle accident case occurred in 1993, and the other two in 2003. All OCP cases were closed shortly after opening. Based on the available information, impacts to the LOD from the lead abatement or OCP cases is unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-2561</i>	<p>The LOD lies along the interchange from north-bound I-95 to west-bound Sandy Spring Road (MD 198), in Laurel, Maryland. The area surrounding the LOD was primarily forested land with residential properties to the north. This land was cleared when I-95 was constructed in the 1970s. The Sandy Spring Road overpass of I-95 was listed twice on the RCRA LQG databases, both for lead generation, likely associated with lead abatement during maintenance events. Any historical lead leaching from the overpass would not have been directed towards the LOD. In addition, three OCP cases were listed at the intersection of Sandy Spring Road and I-95. Two of the OCP cases were listed as vehicle accidents, while the third did not state but is presumed to also be a vehicle accident. One OCP vehicle accident case occurred in 1993, and the other two in 2003. All OCP cases were closed shortly after opening. Based on the available information, impacts to the LOD from the lead abatement or OCP cases is unlikely.</p>
<i>PAX-3002</i>	<p>The LOD is located along the south side of Frederick Road (MD 144), between Thompson Drive and Triadelphia Road, in Ellicott City, Maryland. The surrounding area is primarily residential properties. Residential development is observed to begin prior to 1959 and continued through 2009, when the surrounding area was observed to be developed in its current configuration. One record of concern, an OCP case from 1992, was noted at a distance of 655 feet from the LOD. It is unknown whether a release occurred, however the case was closed within the same day. Based on the distance of the incident, impacts to the LOD are unlikely.</p>
<i>PAX-3003</i>	<p>The LOD is located along the south side of I-70, west of the Baltimore National Pike (US Route 40), in Ellicott City, Maryland. The surrounding area is a mix of commercial and residential properties. Commercial and residential development is observed to begin in 2005. The surrounding area is observed to be in its current configuration by 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-3004</i>	<p>The LOD is located along the south side of the north-bound onramp from MD 40 to I-70, in Ellicott City, Maryland. The surrounding area is primarily forested land. Development of transportation infrastructure is observed to begin prior to 1959. The surrounding area is observed to be in its current configuration by 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-3006</i>	<p>The LOD is located along the central median of Sykesville Road (MD 32), north of the intersection with Livestock Road, in West Friendship, Maryland. The surrounding area is primarily residential developments and forested land. Residential development is observed to begin prior to 1959, and is in its current configuration by 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-3007</i>	<p>The LOD is located along eastern side of Sykesville Road (MD 32), north of the intersection with Livestock Road, in Sykesville, Maryland. The surrounding area is a mix of residential developments and forested land. Residential development of the surrounding area is observed to begin in 1995, and are in its current configuration by 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-3008</i>	<p>The LOD is located along the central median of Sykesville Road (MD 32), south of the intersection with Livestock Road, in Sykesville, Maryland. The surrounding area is primarily residential developments and forested land. Residential development is observed to begin prior to 1959, and is in its current configuration by 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-3009</i>	<p>The LOD is located along the central median of Sykesville Road (MD 32), south of Livestock Road, Sykesville, Maryland. The surrounding area is primarily residential developments and forested land. Residential development is observed to begin prior to 1959, and is in its current configuration by 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-3011</i>	<p>The LOD is located in a median along the eastern side of Sykesville Road (MD 32), south of the Baltimore National Pike (US Route 40) overpass in, West Friendship, Maryland. The surrounding area is semi-rural with some residential properties. The surrounding area was used for agricultural purposes since at least 1959. Residential development was observed to begun prior to 1982, and the surrounding area was viewed in its current configuration by 2005. The database listed an OCP case for a tank closure with a release and cleanup activities occurring 85 feet from the LOD; however, following receipt of information from MDE on this case, it was determined that this OCP case is actually located approximately 4,500 feet south of the LOD. Based on this distance, impacts to the LOD are unlikely.</p>
<i>PAX-3012</i>	<p>The LOD is located along the central median of I-70, near the on/off ramps for Sykesville Road (MD 32), in Marriottsville, Maryland. The surrounding area is a mix of rural agricultural land, forested land and commercial properties. Development of the surrounding area is observed to begin prior to 1982, and is in its current configuration by 2005. One record of concern, a facility listed on the UST and OCP databases, was mapped at 485 feet from the LOD. The OCP case was opened for removal of A 1,000-gallon gasoline UST. A release and cleanup actions occurred, and the case was closed within a year. Based on local topography the site is believed to located downgradient/crossgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>
<i>PAX-3014</i>	<p>The LOD is located along the north side of Frederick Road (MD 144), immediately west of Morgan Station Road, in Woodbine, Maryland. The surrounding area is semi-rural with some residential properties. Residential development is observed to begin in 1959 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-3016</i>	<p>The LOD is located along the central median of MD 97, south of Monticello Drive, in Cooksville, Maryland. The surrounding area is semi-rural with patches of forested land. Development of the surrounding area is observed to begin by 1982, and continued through 2005, when the surrounding area was observed to be developed in its current configuration. An OCP case was opened approximately 825 feet north of the LOD in 1991, for an unknown reason related to motor/lube oil. No release or cleanup activities were reported. The case was closed 16 years later. Based on the distance of the site from the LOD, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-3017</i>	<p>The LOD is located in the ROW along the onramp from Woodbine Road (MD 94) to Baltimore National Pike (I-70), in Woodbine, Maryland. The surrounding area is semi-rural with patches area of forested land. Based on a review of historical imagery, development to the south and southeast of the LOD was present as early as 1959. The median and interchange were first observed in 1981. The surrounding area was observed to be developed in its current configuration by 1995. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
<i>PAX-3018</i>	<p>The LOD is located along the eastern side of Woodbine Road (MD 94), immediately north of Frederick Road (MD 144), in Woodbine, Maryland. The surrounding area is semi-rural with a mix of commercial and residential developments. Commercial and residential development is observed to begin prior to 1959, and is in its current configuration by 1995. Five records of concern were listed, the closest being approximately 215 feet from the LOD, involving a release of ½ gallon of hydraulic fluid due to a leaking line on a trash truck. This release was addressed using absorbent material. The remaining four records, three OCP cases and one UST case, are all greater than 500 feet from the LOD. Based on this, impacts to the LOD are unlikely.</p>
<i>PAX-3024</i>	<p>The LOD is located northwest of the intersection between Georgia Avenue (MD 97) and Heritage Hill Drive, in Brookeville, Maryland. The surrounding area is primarily residential neighborhoods. The surrounding area was primarily developed as agricultural properties up until approximately 1971, when residential development began to the west. The surrounding area was observed to be developed in its current configuration by 2018. There are two database listings associated with OCP cases and UST were listed at properties 390 feet to the south and 1,100 feet to the northeast. Both sites are believed to be downgradient of the LOD. All the USTs have been removed and cases received closure from MDE. Thus, impacts to the LOD are unlikely since the sites are believed to be downgradient.</p>
<i>PAX-3025</i>	<p>The LOD is located along the west side of Georgia Avenue (MD 97), between Heritage Hill Drive and Gold Mine Road, in Brookeville, Maryland. The surrounding area was primarily developed as agricultural properties up until approximately 1971, when residential development began to the west. The surrounding area was observed to be developed in its current configuration by 2018. A site was identified in the environmental database report approximately 45 feet east of the LOD that previously operated four 1,000 gallon USTs and has had two OCP cases (closed) at the site; however ever after further review the listings are associated with a former church that was once located approximately 1,050 feet northeast of the LOD, near a currently active retirement home. Based on local topography the site is located downgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
PAX-3026	<p>The LOD is located along the east site of Georgia Avenue (MD 97), between Heritage Hill Drive and Gold Mine Road, in Brookeville, Maryland. The surrounding area was primarily developed as agricultural properties up until approximately 1971, when residential development began to the west. The surrounding area was observed to be developed in its current configuration by 2018. A site was identified in the environmental database report approximately 10 feet southeast of the LOD that previously operated four 1,000 gallon USTs and has had two OCP cases (closed) at the site; however ever after further review the listings are associated with a former church that was once located approximately 1,050 feet northeast of the LOD, near a currently active retirement home. Based on local topography the site is believed to be located downgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>
PAX-3801	<p>The LOD is located along the east side of New Hampshire Avenue (MD 650), north of Brooke Road, in Ashton-Sandy Springs, Maryland. The surrounding area is primarily residential. Residential development in the surrounding area is observed to begin around 1963 and continue through 2005, when the surrounding area was observed to be developed in its current configuration. In 1995, approximately 4-gallons of fuel oil was spilled due to the overfilling of a tank at a residential property approximately 550 feet south of the LOD. The material was contained, cleaned up, and properly disposed of. Based on the quantity released and distance, impacts to the LOD are unlikely.</p>
PAX-3802	<p>The LOD is located along the northeast side of New Hampshire Avenue (MD 650), northwest of Avenleigh Drive, in Ashton-Sandy Spring, Maryland. The surrounding area is primarily residential. Residential development was observed to begin prior to 1959 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-4001	<p>The LOD is located along the south side of Damascus Road (MD 108), west of the Bowman Acres Lane, in Damascus, Maryland. The surrounding area is primarily rural agricultural land with some residential properties to the south and west. Development of the surrounding area is observed to begin prior to 1959 and continued through 2007, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
PAX-4003	<p>The LOD is located along the north side of Damascus Road (MD 108), west of the Bowman Acres Lane, in Damascus, Maryland. The surrounding area is primarily rural agricultural land with some residential properties to the south. Development of the surrounding area is observed to begin prior to 1959 and continued through 2007, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
<i>PAX-4004</i>	<p>The LOD along the east side of Pennsylvania Avenue (MD 4), west of Pennsylvania Avenue Service Road, and north of Armstrong Lane, in Upper Marlboro Maryland. The area surrounding the LOD was primarily agricultural land until the late 1970s, when development was observed to occur. Joint Base Andrews has been present to the south of the LOD since 1949. Commercial development of the area surrounding the LOD was first observed in 1981. The surrounding area was observed to be developed in its current configuration in 2018. Several OCP cases were identified in the immediate vicinity of the LOD. However, after further review, two of the sites were found to be located between 470 and 850 feet to the northeast (crossgradient) of the LOD. A former gas station is located approximately 265 feet south (downgradient) of the LOD. Two 1,000 gallon USTs (heating oil and used oil) were excavated from the site in 1997. Three gasoline underground storage tanks (USTs) were removed: two 6000-gallon and a 10,000-gallon gasoline and diesel UST were excavated and removed from the site in 2008 as part of the demolition of the facility. Residually impacted soil is believed to be present onsite; however, since the site is downgradient of the LOD, impacts are unlikely.</p>
<i>PAX-4007</i>	<p>The LOD is located along west side of Silver Hill Road (MD 458), north of Marlboro Pike (MD 4), in District Heights, Maryland. The northwestern portion of the LOD is believed to be located within private property. The surrounding area is observed to be predominantly residential, commercial and institutional properties. Residential development in the surrounding area began in the late 1950s. Commercial development began in the 1980s. The LOD and surrounding area appeared in their current configuration by 2009. Two gas stations and an auto repair shop with multiple closed and active USTs and OCP cases are located between 440 and 490 feet south of the LOD. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
<i>PG-00079-Backup</i>	<p>The LOD is located along Cabin Branch stream, between Dateleaf Avenue/Calmost Street to the east and 71st Avenue to the west, in Capitol Heights, Maryland. The surrounding area is primarily residential. A municipal public pool is located directly east of the LOD. In 1960, the LOD and immediate area around the LOD was observed to be primarily forested land, with residential development observed further out in all directions. Residential development continued through 1981 when the surrounding area was observed to be developed in its current configuration. Three OCP cases were identified between 245 and 345 feet to the east/northeast of the LOD. Two of the case involved releases of approximately 1-gallon of heating oil, while the third involved a release of approximately 1-gallon of used oil. All three cases have been closed by MDE. Based on the distances, the limited quantities released, and OCP case statuses, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
SSS-150023	<p>The LOD is located along an unnamed tributary of the Northwest Branch Anacostia River, south of the Glenallan Avenue, in Silver Spring, Maryland. The eastern portion of the LOD is bisected by Kemp Mill Road. The surrounding area is a mixture of parkland, residential properties and forest land. The surrounding area was primarily agricultural and forest land, with the exception of several residential properties to the east, up until the 1960s, when additional residential development began to occur to the east and west. An equestrian center directly north of the LOD was constructed by 1964. The surrounding area was observed in its current configuration by the early 1970s. One record of concern, an OCP case from 1996, was mapped at 510 feet from the LOD. Limited information was available, but the incident appears to be associated with a release occurring during delivery of home heating oil to a residential dwelling. The OCP case was closed approximately 2 months later. Based on the local topography, the site appears to be crossgradient of the LOD. Thus, impacts to the LOD from this incident is unlikely.</p>
SSS-160023-Backup	<p>The LOD is located along a stream known as Bald Hill Branch, south of John Hanson Highway (US Route 50), in Springdale, Maryland. Commercial properties are located to the north, across John Hanson Highway, while residential properties and forested land are located to the south, east and west. The surrounding area was primarily forest and agricultural land up until the 1950s/1960s, when residential and commercial development began. John Hanson Highway to the north as well as its interchange with Martin Luther King Jr Highway (MD 704) to the northwest were completed around 1960. The surrounding area was observed in its current configuration around 1993. No records of concern were identified during this environmental review.</p>
SSS-160065_160066	<p>The LOD is located in within Tanglewood Park, between Tanglewood Drive to the west and Greenway Drive/Spring Lane to the east, in Hyattsville, Maryland. The surrounding area is mixed-use residential and commercial. The Northeast Branch Anacostia River is located west of the LOD, while residential and commercial properties are located north, east and south. Development in the surrounding area started prior to 1937. Fletcher's Field, located at the southern end of the LOD, was constructed in the early 1950s. By the 1970s, the surrounding area was developed in its current configuration. Nine sites of concern with former leaking USTs, OCP cases and/or document spills/releases were identified between 455 and 1,010 feet of the LOD. The most concerning of these sites was an active gas station located 445 feet to the east (upgradient). This gas station (Chevron - 5301 Kenilworth Ave) currently has three active 10,000-gallon gasoline USTs (fiberglass, installed in 1986), as well as two former USTs, a 1,000-gallon heating oil UST and 1,000-gallon used oil UST. Based on information provided by MDE, the former 1,000-gallon USTs were excavated and removed from the site in 2003. Soil samples were collected and analyzed for petroleum constituents, which were all non-detect. Three other OCP cases have been assigned to this gas station; however, these were associated with compliance violations that did not involve releases, and were closed by MDE once the deficiencies were corrected. Based on this information, this gas station is unlikely to have impacted the LOD. The remaining eight sites with documented releases are not expected to have an impact on the LOD based on either their distance from the LOD, release quantity, hydraulic direction and/or case status.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0010	<p>The LOD is located along the northern side of Martin Luther King Jr Highway (MD 704), east of Hill Road, in Hyattsville, Maryland. The surrounding area is mixed-use residential and commercial. A stream is located to the east of the LOD. Development of the surrounding area started prior to 1960 and continued up until 1981, when the surrounding area was observed in its current configuration. A gas station with documented releases is located approximately 425 feet to the east; however, the gas station is hydraulically disconnected from the LOD by a stream running north to south. Three other closed OCP cases are located approximately 605 to 650 feet to the north and south of the LOD; however, the sites are downgradient or crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-0012	<p>The LOD is located along the western side of the on-ramp for south-bound John Hanson Highway (US Route 50) from east-bound Landover Road (MD 202), in Hyattsville, Maryland. The surrounding area is mixed-use residential/commercial with commercial and residential properties located to the north, south and west and primarily commercial properties to the east, beyond the interchange with John Hanson Highway. Residential development began in the 1940s/1950s, while commercial development began in the 1960s, approximately about the same time as when the John Hanson Highway and interchange with Landover Road was observed to have been completed (1963). The surrounding area was observed in its current configuration in 1981. An active drycleaner is located approximately 645 feet northwest of the LOD (upgradient). There are no reported violations associated with the cleaners and based on its distance from the LOD, impacts are unlikely. Several other records of concern are located within 1,385 feet of the LOD; however, based on the type of records (e.g. air permit, RCRA NON GEN) hydraulic direction (crossgradient/ downgradient) of the LOD, impacts from these sites/incidents on the LOD are unlikely.</p>
WAS-0013	<p>The LOD is located within a median formed by the interchange of John Hanson Highway (US Route 50) and Landover Road (MD 202), in Hyattsville, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are located to the north and south of the LOD, commercial and residential properties to the west, and primarily commercial properties to the east. Residential development began in the 1940s/1950s, with the John Hanson Highway and associated interchange with Landover Road observed to have been completed in 1963. The surrounding area was observed in its current configuration around 1981. A printshop is located approximately 540 feet to the northwest that has an active air permit (no violations). Two vehicular spills have occurred approximately 225 to 235 feet south of the LOD. Both spills were minor in quantity and were reportedly cleaned-up. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0070	<p>The LOD is located in the southeastern portion of the interchange between John Hanson Highway (US Route 50) and Baltimore-Washington Parkway (MD 201), in Hyattsville, Maryland. The surrounding area is primarily vacant land. Light industrial and commercial properties are located to the northeast and southeast, and a wastewater treatment plant to the southwest. By the 1960s, many of the industrial and commercial properties were observed to be present to the northeast and southeast, while the wastewater treatment plan was observed in 1981. Two records of concern in the surrounding area were identified. An active scrap metal facility, located approximately 505 feet south of the LOD, was listed as having a 10,000-gallon and 8,000-gallon diesel USTs closed via excavated in 1986 and 1994, respectively, as well as receiving multiple violations for improper storage of hazardous and petroleum products. The Beaverdam Creek separates the LOD from scrap metal facility; thus, the LOD is likely not hydraulically connected to the scrap metal facility. The second record, an OCP case associated with a vehicle accident occurring 565 feet from the LOD. Based on this distance, impacts to the LOD from this incident are unlikely.</p>
WAS-0072	<p>The LOD is located along the south side of Landover Road (MD 202), east of Cheverly Avenue, in Cheverly, Maryland. The surrounding area is primarily residential, with the exception of a professional office complex located west of Cheverly Avenue. The surrounding area was observed to be developed with residential properties beginning in 1945, with the Baltimore-Washington Parkway constructed around 1960. In 1971, the office park to the west was observed to have been constructed and the surrounding area was observed in its current configuration. An OCP case related to soil contamination was opened at a property approximately 180 feet to the southwest (downgradient) of the LOD. The material was addressed/remediated and the case closed one month later. Based on status (closed) and hydraulic direction, impacts to the LOD from this incident are unlikely.</p>
WAS-0073	<p>The LOD lies along the southern side of Landover Road (MD 202), east of the overpass for Martin Luther King Jr Highway (MD 704), in Greater Landover, Maryland. The area to the north, east, and south is primarily residential properties. The surrounding area was vacant forested land up until 1960, when development of the residential properties to the south of the LOD was observed. The area surrounding the LOD has been in its current configuration since 1981. One record of concern, the Landover Road overpass of Martin Luther King Jr Highway, was listed as a RCRA LQG likely associated with lead abatement during maintenance activities. Impacts to the LOD from the overpass work are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0074	<p>The LOD lies along the west side of Brightseat Road, north of the intersection with Sheriff Road, in Landover, Maryland. A portion of the LOD extends east, across Brightseat Road. Paved and unpaved parking lots associated with FedEx Field are present to the west, southwest and southeast. Commercial structures are located to the north and east. The surrounding area was primarily agricultural and forested land up until the later 1970s, when commercial development began. The LOD and surrounding area were observed to be developed in their current configuration around 2005. Four sites were identified in the environmental database between 295 feet and 530 feet of the LOD, that were listed either having former USTs, OCP cases, reported SPILLS, or being RCRA generators. The closest facility, an auto dealership located 295 feet from the LOD, previously had a 1,000-gallon used oil UST and two 2,000-gallon gasoline USTs removed in 1995. No releases associated with the former USTs were reported. An additional OCP case was noted with this facility, occurring in 1987; however, no other information was available other than it was closed later that year. Based on a review of historical imagery, the former USTs are believed to be at least 415 feet to the northwest (crossgradient) of the LOD. The three remaining sites identified to have potential environmental concerns are more than 450 feet of the LOD. Thus, impacts from these sites are unlikely.</p>
WAS-0075	<p>The LOD is located along the west side of Martin Luther King Jr Highway (MD 704), south of the Landover Road (MD 202), in Hyattsville, Maryland. The surrounding area is observed to be primarily residential, which began in the early 1950s. The overpass directly north of the LOD was observed to have been completed by 1971. Additional residential development continued in the immediate area up until 2005, when the surrounding area was observed in its current configuration. One record of concern, the Landover Road overpass, was listed as a RCRA LQG likely associated with lead abatement during maintenance activities. Impacts to the LOD from the Landover Road overpass work are unlikely.</p>
WAS-0076	<p>The LOD lies along the southern side of Martin Luther King Jr. Highway (MD 704), east of Reed Street, in Glenarden, Maryland. The area was primarily forest land until residential and commercial development started in the 1960's. Development continued through the 1970's and early 1980's. The area surrounding the LOD has been observed in its current configuration since 1981. One record of concern, an ERNS case located 354 feet to the south, had a leak of natural gas at an apartment structure. The local natural gas company responded and addressed the leak. Based on the distance and type of release, impacts to the LOD are unlikely.</p>
WAS-0077	<p>The LOD is primarily located along the western side of Martin Luther King Jr. Highway (MD 704), north of E Ridge Drive, in Hyattsville, Maryland. A portion of the LOD is present in the center median for Martin Luther King Jr. Highway. The surrounding area is primarily residential. A stream running east to west is observed to the north of the LOD. Based on historical imagery, the surrounding area was rural/vacant land up until the mid-1940s, when residential development was observed to the southwest of the LOD. Residential development continued up until the 1970s when the surrounding area was observed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0078	<p>The LOD is located along the western side of Martin Luther King Jr. Highway (MD 704), north of Goodland Drive, in Hyattsville, Maryland. The surrounding area is primarily residential, with a gas station and school located to the southwest. A stream running east to west is observed further to the south. Based on historical imagery, the surrounding area was rural/vacant land up until the mid-1940s, when residential development was observed southwest of the LOD. Residential development continued up until the 1980s when the surrounding area was observed to be developed in its current configuration. A gas station located approximately 65 feet south of the LOD has existed since 1970. Nine petroleum USTs ranging in size from 550-gallons to 12,000-gallons have been registered to this gas station property. Currently there are three USTs, one 12,000-gallon gasoline, one 6,000-gallon diesel and one 10,000-gallon gasoline UST active onsite. Six OCP cases have been open and closed at the facility, one of which was in regard to a ground seep investigation/clean-up that was opened in September 2001 and closed in December 2001. Three spills have occurred that resulted in releases to the ground surface, all of which were properly addressed and closed. Based on available data provided by MDE through a PIA request, there is known petroleum impacted soil and groundwater above MDE actions levels currently onsite; however, the site is hydraulically downgradient of the LOD based on groundwater surveys conducted during the environment investigations performed at the gas station facility. Thus, impacts to the LOD are unlikely, as impacts from the gas station would migrate away from the LOD.</p>
WAS-0081	<p>The LOD is primarily located within the central median of John Hanson Highway (US Route 50), east of Arbor Street, in Hyattsville, Maryland. The central portion of the LOD extends south, across John Hanson Highway. The surrounding area is mixed use development, with residential structures to the north, commercial and residential developments west, commercial and transportation to the south, and commercial development to the east. The surrounding area was primarily forested land and residential properties, with train tracks to the south, up until the 1960s. In 1963, the John Hanson Highway was observed to have been constructed. A metro line and station were added in late 1970s/early 1980s. A elementary school approximately 460 feet northwest of the LOD had a known release from a 10,000-gallon UST that was addressed and closed in 2004. An OCP case related to dumping along the metro tracks, southwest of the northwest of the LOD, was opened in 1996, of which the material was addressed and the case closed in 1998. Based on the local topography, the elementary school appears crossgradient of the LOD, while the dumping incident appears downgradient of the LOD; therefore, impacts to LOD are unlikely.</p>
WAS-0082	<p>The LOD is primarily located within a central median of John Hanson Highway (US Route 50), east of Columbia Park Road, in Cheverly, Maryland. The western end of the LOD extends south, across John Hanson Highway. The surrounding area is mixed use development, with residential structures to the north, commercial and residential development to west, commercial and transportation development to the south, and commercial development to the east. The surrounding area was primarily forested land and residential properties, with train tracks to the south, up until the 1960s. In 1963, the John Hanson Highway was observed to have been constructed. A metro line and station were observed to have been constructed in late 1970s/early 1980s. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0083	<p>The LOD is located along the southern side of Landover Road (MD 202) and extends south, across Quincy Street, in Hyattsville, Maryland. The surrounding area is mixed-use residential/ commercial. The surrounding area was observed to be sparsely developed with residential properties in 1945; however, by 1960 substantial residential and commercial development had been completed. By 1971, the surrounding area was observed in its current configuration. A surface release of diesel fuel occurred approximately 35 feet from the LOD in 1994; however, the release was addressed and the case closed. A gas station, former dry cleaner, and facilities that formerly had USTs are located approximately 520 to 625 feet north/northwest of the LOD; however, based on the local topography, these sites are all believed to be downgradient of the LOD; therefore, impacts to the LOD are unlikely.</p>
WAS-0085	<p>The LOD is located primarily along the southern side of Landover Road (MD 202), west of John Hanson Highway (US Route 50), in Hyattsville, Maryland. The western end of the LOD extends north, into the center median of Landover Road. The surrounding area is mixed-use residential/commercial. Commercial and residential properties are to the north, south and west, while primarily commercial properties are to the east, beyond the interchange with John Hanson Highway. Residential development began in the 1940's/1950's, while commercial development began in the 1960's, approximately about the same time as when the John Hanson Highway and interchange with Landover Road was observed to have been completed (1963). The surrounding area was observed to be developed in its current configuration around 1981. Two vehicle accidents were reported near the intersection of Landover Road and John Hanson Highway, one in 2014 and one in 2017. The 2014 incident involved a fuel delivery truck's saddle tank rupturing which released diesel fuel into a nearby creek. The closest creek to the LOD is over 800 feet away, indicating this incident did not occur near the LOD. The 2017 accident incident result in a minor 2-gallon release of motor oil to the road surface only. Facilities listed on the RCRA generator database were listed at 110 feet, 515 feet and 560 feet from the LOD; however, none of these facilities had any reported violations. Impacts to the LOD from these incidents/facilities are unlikely.</p>
WAS-0086	<p>The LOD is primarily located along the central median of John Hanson Highway (US Route 50), east of Columbia Park Road, in Cheverly, Maryland. The western end of the LOD extends south and runs across the southern side of John Hanson Highway. The surrounding area is mixed use development, with forested land and residential structures to the north, residential development to west, commercial development to the south and east. The surrounding area was primarily forested land and residential properties, with train tracks to the south, up until the 1960s. In 1963, the John Hanson Highway was observed to have been constructed. A metro line and station were observed to have been constructed in late 1970s/early 1980s. The surrounding area was observed to be developed in its current configuration around 1989. An OCP case related to a release of motor oil was opened at a site approximately 645 feet south (crossgradient) of the LOD. The material was addressed/cleaned-up and the case was closed. Impacts to the LOD are unlikely based on the distance and hydraulic direction from the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0303	<p>The LOD is located along the north side of Central Avenue (MD 215), immediately east of Gentry Lane, in Capitol Heights, Maryland. The surrounding area is primarily residential, with the exception of some forest land to the south and a church to the east. The surrounding area was observed to be relatively rural and undeveloped up until the 1970s when additional residential development began to occur to the northwest and east. The surrounding area was observed to be developed in its current configuration in around the late 1980s/early 1990s. No records of concern in the vicinity of the LOD that would have an impact on the LOD were identified during this environmental review.</p>
WAS-0304	<p>The LOD is located along the south side of Central Avenue (MD 214), directly south of the intersection with Soper Lane, in Capitol Heights, Maryland. The surrounding area is mixed-use residential/commercial. A metro rail line and station are located to the south along with some residential properties and parkland. The surrounding area was observed to be relatively rural and undeveloped up until the 1970s when residential development began to occur to the northwest and east. Residential and commercial developed up until the early 2010s, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD that are believed to impact site were identified during this environmental review.</p>
WAS-0307	<p>The LOD is located along the southern side of Pennsylvania Avenue SE (MD 4), east of Southern Avenue SE, in Capitol Heights, Maryland. The surrounding area is primarily residential, with intermixed commercial properties. Residential development to the north and west began prior to the 1940s, which expanded to the south and east through the 1970s. The LOD and surrounding area was observed in its current configuration by the mid-1980s. Three OCP cases are listed at properties between 210 and 585 feet of the LOD. One facility, an apartment complex located 565 feet northeast, was listed in the UST and OCP databases. Three closed OCP cases are associated with former USTs, one of which was reported to have had a release with associated cleanup activities. Based on the local topography, the facility appears located hydraulically crossgradient of the LOD. The leaking underground storage tank case 210 feet to the southwest appears crossgradient of the LOD. The third case is approximately 585 feet in an apparent upgradient direction of the LOD; however, the case was closed in less than 6 months; therefore, impacts were most likely minor in nature. Thus, impacts to the LOD are unlikely.</p>
WAS-0312	<p>The LOD is located in the central median of Pennsylvania Avenue SE (MD 4), west of Shadyside Avenue, in Capitol Heights, Maryland. The surrounding area is primarily residential and cemetery. Residential development to the north and west began prior to the 1940s, which expanded to the south and east through the 1970s. The area was observed to be developed in its current configuration by the mid-1980s. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0313	<p>The LOD is located in the central median of Pennsylvania Avenue SE (MD 4), west of Shadyside Avenue, in Capitol Heights, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, residential development to the north and west started prior to the 1940s, which expanded to the south and east through the 1970s. The LOD and surrounding area was observed to be developed in its current configuration by the mid-1980s. No records of concern that would have an impact on the LOD were identified during the environmental review.</p>
WAS-0315	<p>The LOD is located along the eastern side of Suitland Road (MD 218), north of Swann Road, in Hillcrest Heights, Maryland. A portion of the LOD extends west, across Suitland Road. The surrounding area is primarily residential to the north and east, governmental agencies to the south-southeast, and the Washington National Cemetery to the west and northwest. Based on a review of historical imagery, residential development began by 1940s with additional apartment developments continuing into the 1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. Eighteen facilities were flagged in the database report; however, eight of these were mapped incorrectly and were actually located 800 feet or greater from the LOD. Of the remaining 10 facilities, the closest facility, the Federal Aviation Administration's Suitland Center, located 160 feet from the LOD, had an OCP case opened for the removal of a 2,000-gallon gasoline UST in 1997 which stated a release had not occurred. The remaining facilities, all located 285 feet or greater, were associated with either minor surface releases, UST removals without documented releases, or were at a significant distance from the LOD. Based on the distances, statuses and anticipated hydraulic directions (cross or downgradient), these remaining facilities are unlikely to have an impact on the LOD.</p>
WAS-0317	<p>The LOD is located the western side of Suitland Road (MD 218), north of Swann Road, in Hillcrest Heights, Maryland. The surrounding area is residential to the northeast and east, governmental agencies to the south-southeast, and the Washington National Cemetery to the north and west. Based on a review of historical imagery, residential development began by 1940s with additional apartment developments continuing into the 1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. Sixteen facilities were flagged in the database report; however, eleven of these were mapped incorrectly and were actually located 500 feet or greater from the LOD. Of the remaining five records, four were associated with either UST removals without releases, were RCRA generators without documented violations, or involved sewage. The lone record that involved a documented release, occurring 320 feet from the LOD, was a release of one quart of heating oil during refilling of an AST. Based on the distance, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0318	<p>The LOD is located along the eastern portion of Branch Avenue (MD 5), south of Southern Avenue SE, in Hillcrest Heights, Maryland. The surrounding area is primarily residential, especially to the east, west and north, across the border into Washington D.C. Based on a review of historical imagery, residential development began before the 1940s with additional apartment developments continuing into the 1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. The only records of concern were two closed OCP cases, located 600 feet southwest (crossgradient) from the LOD, associated with the closure of an UST and installation of a new UST. Based on distance and hydraulic direction, impacts to the LOD from this UST site is unlikely.</p>
WAS-0320	<p>The LOD is located along the northeast portion of St. Barnabas Road (MD 414) and Branch Avenue (MD 5) interchange, in Marlow Heights, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are primarily located to the east and south of Branch Avenue, while commercial developments are located to the north and west beyond St. Barnabas Road. Based on a review of historical imagery, residential development began in the 1940s with commercial developments continuing into the 1960s/1970s. The LOD and surrounding area was observed to be developed in its current configuration by the early 1980s. Two SPILLS incidents listed at 500 and 610 feet from the LOD were associated with disposal of trash on a vacant lot and a 10-gallon release of mineral oil, respectively. Based on distances, hydraulic direction and case statuses, impacts to the LOD from these incidents are unlikely.</p>
WAS-0321	<p>The LOD is located along the northern side of Branch Avenue (MD 5) east of the St. Barnabas Road (MD 414) interchange, in Marlow Heights, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are primarily located to the north and south, while commercial developments are located to the north and west, beyond St. Barnabas Road. Based on a review of historical imagery, residential development began in the 1940s with commercial developments continuing into the 1960s/1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. Two records of concern were identified. The first record, associated with the Branch Avenue overpass for St. Barnabas Road, was listed as a RCRA LQG for lead abatement. Based on surface topography, any prior lead leaching would not have been directed towards the LOD. The second record, a SPILLS incident occurring 660 feet northeast from the LOD, involved the release of 10 gallons of mineral oil when a vehicle hit a transformer. Based on the distance of this incident, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0322	<p>The LOD stretches along St Barnabas Road (MD 414), at the on/off ramps to Branch Avenue (MD 5), in Hillcrest Heights, Maryland. The surrounding area is mixed use residential/commercial developments, which begin prior to 1949. Beginning in the late 1950s commercial development to the west and south began, as well as residential development to the east and continued through 1998 when the surrounding area was observed in its current configuration. Although the area surrounding the LOD includes ten sites with environmental concerns, most sites are located more than 300 feet downgradient or crossgradient from the LOD where impacts to the LOD are unlikely. A former Kmart is located approximately 315 feet crossgradient of the LOD, which had a 1,000-gallon used oil UST excavated and removed in 1990 and a 550-gallon grit chamber for an oil/water separator excavated and removed in 2004. Information provided in the database report did not state whether a release had occurred or not for the 1,000-gallon UST and a request to MDE for additional information determined their files had been deleted. Available records for the closure of the oil/water separator indicated that the surrounding area had not been impacted based on analytical results from soil samples collected and analyzed for petroleum constituents, all of which were non-detect. Regardless, as the former USTs are located hydraulically crossgradient of the LOD, impacts to the LOD are unlikely.</p>
WAS-0326	<p>The LOD is located along the east side of Indian Head Highway (MD 210), south of Livingston Road, in Oxon Hill, Maryland. The surrounding area is primarily residential, which began prior to 1949 and continued through 2005, when the surrounding area was observed in its current configuration. Two OCP cases and a spill case located approximately 210 and 450 feet northeast (downgradient) of the LOD were listed in the environmental database report. Both sites were found to have impacted subsurface media. The site approximately 210 feet to the northeast of the LOD involved a leaking residential 550-gallon heating oil UST which was closed in-place in 1996. An AST was installed in its place and was subsequently removed in 2013, when 1-gallon of heating was found to have leaked from the tank. The site approximately 450 feet northeast of the LOD involved a leaking 2,000-gallon heating oil UST associated with a local government building in 1993. Based on available information provided by MDE through a PIA request, both sites were closed by MDE and the owners of both sites were allowed to leave impacted material in-place; however, both sites are believed to be downgradient of the LOD. Based on distance and hydraulic direction, impacts to the LOD are unlikely.</p>
WAS-0333	<p>The LOD is located along I-95, west of the offramp from MD-414, in Oxon Hill, Maryland. The surrounding area is residential to the north, forested land to the east and some commercial development to the south. Commercial and residential development began by 1971, and is observed in its current configuration by 1998. No records of concern were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0334	<p>The LOD is located along I-95, east of the onramp from St Barnabas Road (MD 414) to I-95, in Oxon Hill, Maryland. The surrounding area is comprised of the I-95/St Barnabas Road interchange, forested land and some commercial and residential properties. Development of the surrounding area is observed to begin prior to 1949. The surrounding area is observed to be in its current configuration by 1998. There are two OCP cases located 385 feet or greater to the east of the LOD. Both cases were opened for vehicular accidents and have since been closed and are believed to be crossgradient/ downgradient of the LOD. Thus, impacts to the LOD from these incidents are unlikely.</p>
WAS-0340	<p>The LOD is located along the offramp from I-495 at St Barnabas Road (MD 414), in Oxon Hill, Maryland. The surrounding area is observed to be mixed use residential commercial development, along with Interstate I-495 to the south. Commercial and residential development is observed to begin prior to 1949 and continued through 1998, when the surrounding area was observed to be developed in its current configuration. The LOD is surrounded by two gas stations to the northeast and several apartment complexes to the west which, all have environmental concerns. Both gas stations have USTs onsite that are currently in use and have had multiple spills and OCP cases. An Exxon gas station is approximately 150 feet northeast of the LOD. All other sites are over 500 feet from the LOD. Thus, impacts to the LOD are unlikely. Based on available information provided by MDE through a PIA request for Exxon Station, a 1,000-gallon heating oil UST and 1,000-gallon used oil UST were excavated and removed from the site. Approximately 27 tons of impacted subsurface material from the excavation, as well as another ton of impacted material from underneath the product lines was disposed of offsite. Confirmation soil samples were collected and analyzed for TPH, VOCs, and metals, all of which were below MDE action levels. The case received closure in August 1999. In December 1999, hydraulic lifts, and oil/water separator, and dispenser islands were removed during renovations. Approximately 1036 tons of impacted soil around the former equipment was excavated and disposed of offsite. Soil samples from the site indicated that substantial petroleum impacts were present in soil and groundwater at the site. Based on available data, BTEX and MTBE exceed their corresponding MDE action levels including maximum detections of benzene at 1,200 ug/l, BTEX at 3,857 ug/l, and MTBE at 15,300 ug/l. Groundwater offsite is believed to have not been characterized; however, previous investigations indicate that groundwater is flowing south to north, away from the LOD. In 2002 the case received closure since MDE believed the contamination present onsite did not pose a threat to health or the environment. Based on the local groundwater flow, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0342	<p>The LOD is located in the central median for I-95/ I-495, east of the overpass for St Barnabas Road (MD 414), in Oxon Hill, Maryland. The surrounding area is primarily forested land with some residential properties and transportation infrastructure. Residential development began prior to 1949, and the surrounding area is observed in its current configuration by 1988. Three OCP cases and a RCRA LQG are located within the vicinity of the LOD. Two OCP cases approximately 185 feet west (crossgradient) of the LOD, were opened due to vehicular accidents, both involved releases and cleanup efforts and were closed between 3 weeks and 1.5 months after being opened. The releases would have been surficial to an impervious surface (the roadway) and was cleaned up. The RCRA LQG record is associated with the overpass of St Barnabas overpass for lead generation. Impacts to the LOD from these records are unlikely.</p>
WAS-0343	<p>The LOD is located in the ROW along I-95, between the on/off ramps from St Barnabas Road (MD-414), in Oxon Hill, Maryland. The surrounding area is a mixture of residential and commercial properties. Commercial and residential development is observed prior to 1949 and continued through 1998, when the surrounding area was observed to be developed in its current configuration. An Exxon gas station is approximately 285 feet northeast of the LOD. All other sites are over 500 feet from the LOD. Thus, impacts to the LOD are unlikely. Based on available information provided by MDE through a PIA request for Exxon Station, a 1,000-gallon heating oil UST and 1,000-gallon used oil UST were excavated and removed from the site. Approximately 27 tons of impacted subsurface material from the excavation, as well as another ton of impacted material from underneath the product lines was disposed of offsite. Confirmation soil samples were collected and analyzed for TPH, VOCs, and metals, all of which were below MDE action levels. The case received closure in August 1999. In December 1999, hydraulic lifts, and oil/water separator, and dispenser islands were removed during renovations. Approximately 1036 tons of impacted soil around the former equipment was excavated and disposed of offsite. Soil samples from the site indicated that substantial petroleum impacts were present in soil and groundwater at the site. Based on available data, BTEX and MTBE exceed their corresponding MDE action levels including maximum detections of benzene at 1,200 ug/l, BTEX at 3,857 ug/l, and MTBE at 15,300 ug/l. Groundwater offsite is believed to have not been characterized; however, previous investigations indicate that groundwater is flowing south to north, away from the LOD. In 2002 the case received closure since MDE believed the contamination present onsite did not pose a threat to health or the environment. Based on the local groundwater flow, impacts to the LOD are unlikely.</p>
WAS-0345	<p>The LOD is located in the ROW along Branch Ave (MD 5), immediately west of the St Barnabas Road (MD 414) overpass, in Temple Hills, Maryland. The surrounding area is primarily commercial developments with some residential properties. Commercial and residential development began prior to 1949, and is observed in its current configuration by 1988. There are several records of concern in the vicinity of the LOD, the closest being a RCRA LQG listing associated with lead abatement of the St Barnabas Road overpass. Based on the layout of the roadway system, any leaching of lead from the overpass would not be directed toward the LOD. The remaining records were either for a minor air permit or were facilities mapped as being 510 feet or greater from the LOD. Thus, impacts to the LOD from these incidents are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0346	<p>The LOD is located in the southeast portion of the St. Barnabas Road (MD 414) and Branch Avenue (MD 5) interchange, in Marlow Heights, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are primarily south and east with commercial properties to the west and north beyond the interchange with Branch Avenue. Based on a review of historical imagery, residential development began in the 1940s with commercial development continuing into the 1960s/1970s. The LOD and surrounding area were observed to be developed in its current configuration by the early 1980s. Two inactive drycleaners and a VCP site are located between 330 and 475 feet southwest (downgradient) of the LOD. Two closed OCP cases are associated with an active gas station located approximately 260 feet southwest (downgradient) of the LOD. Subsurface impacts to groundwater were confirmed at the gas station and a former drycleaner; however, as all these sites appear downgradient of the LOD, impacts to the LOD are unlikely.</p>
WAS-0347	<p>The LOD is located within the northwest interchange of Branch Avenue (MD 5) and St. Barnabas Road (MD 414), in Suitland-Silver Hill, Maryland. The surrounding area is mixed-use residential/commercial, with residential properties primarily to the east and south and commercial developments to the west and north. Based on a review of historical imagery, residential development began in the 1940s with commercial developments continuing into the 1960s/1970s. The LOD and surroundings were observed in its current configuration by the early 1980s. There are two closed OCP cases associated with a former UST and AST located at a site approximately 410 feet north (crossgradient) of the LOD. An additional closed OCP case at a site located approximately 655 feet east (crossgradient) of the LOD. A SPILLS event occurred approximately 565 feet north (crossgradient), which involved a motor vehicle motor oil spill; however, the spilled up immediately. Based on distances, hydraulic direction and statuses of these incidents, none are anticipated to have an impact on the LOD.</p>
WAS-0348	<p>The LOD is located within the northwest interchange of Branch Avenue (MD 5) and St. Barnabas Road (MD 414), in Suitland-Silver Hill, Maryland. The surrounding area is mixed-use residential/commercial, with residential properties primarily to the east and south and commercial developments to the west and north. Based on a review of historical imagery, residential development began in the 1940s with commercial developments continuing into the 1960s/1970s. The LOD and surroundings were observed in its current configuration by the early 1980s. There are two closed OCP cases associated with a former UST and AST located at a site approximately 355 feet north (crossgradient) of the LOD. An additional closed OCP case at a site located approximately 1,000 feet east (crossgradient) of the LOD. A SPILLS event occurred approximately 525 feet north (crossgradient), which involved a motor vehicle motor oil spill; however, the spilled up immediately. Based on distances, hydraulic direction and statuses of these incidents, none are anticipated to have an impact on the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0606	<p>The LOD is located in the northeast corner of the intersection of Indian Head Highway (MD 210) and Palmer Road, in Fort Washington, Maryland. The surrounding area is semi-rural with commercial and residential development, which began prior to 1970. The surrounding area is observed in its current configuration prior to 1998. In 1998, an OCP case was opened for the closure of 550-gallon heating oil UST at nursery school approximately 315 feet to the southeast (crossgradient). During the removal of the UST, impacted material was encountered that was addressed and the case was closed approximately 6 months later. Several other sites between 130 and 455 feet of the LOD were identified in the environmental database report; however, based on their hydraulic direction from the LOD (down-/crossgradient) or the type of environmental database record associated with the site (e.g. RCRA generator with no violations), impacts to the LOD are unlikely.</p>
WAS-0610	<p>The LOD is located along the western side of Indian Head Highway (MD 210), between Old Fort Road and Livingston Road, in Fort Washington, Maryland. The surrounding area is semi-rural with commercial and residential developments, which began prior to 1981 and is viewed in its current configuration by 1998. The environmental records of concerns are over 450 feet from the LOD. Further, based on local topography all sites appear located hydraulically downgradient from the LOD. Based on the distances and hydraulic direction, impacts to the LOD are unlikely.</p>
WAS-0614	<p>The LOD is located along the west side of Indian Head Highway (MD 210), between Livingston Road and Old Fort Road, in Fort Washington, Maryland. The surrounding area is mixed-used commercial and residential, which began in the 1960s and continued through 2009 when the surrounding area was observed in its current configuration. Several facilities of concern with current/former UST and OCP cases were identified; however, all sites were located between 300 and 595 feet from the LOD and in a hydraulically cross- to downgradient direction. Based on the distances and hydraulic direction, impacts from these sites are unlikely.</p>
WAS-0615	<p>The LOD is located along the southern side of Oxon Hill Road (MD 414), between Livingston Road and Thompson Lane, in Oxon Hill, Maryland. The surrounding area is mainly commercial properties, with the exception of an apartment complex approximately 315 feet northwest of the LOD. Commercial development is observed to have begun prior to 1963 and continued through 1998, when the surrounding area was observed in its current configuration. A former dry-cleaner with no reported releases or violations is located approximately 385 feet to the north (crossgradient). The apartment complex to the northwest (downgradient) had an OCP case opened in 1991, for the removal of one 6,000 gallon and one 10,000 gallon heating oil UST. Based on available data provided by MDE through a PIA request, visible perforations were observed on the 6,000-gallon UST. MDE requested that two monitoring wells be installed adjacent to the UST and checked for odor and free product, none of which were encountered. The case was closed approximately 2-months later. Based on the hydraulic direction of these records from the LOD (cross- to downgradient) impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0616	<p>The LOD is located along the southern side of Oxon Hill Road (MD 414), west of Thompson Lane, in Oxon Hill, Maryland. The surrounding area is primarily commercial developments which began in 1963. The surrounding area is observed to be in its current configuration in 1998. Several records of concern in the surrounding area were identified. A CVS, mapped at 90 feet from the LOD, was listed as a RCRA LQG, however, there were no violations associated with this operation. A former drycleaner, mapped at 260 feet from the LOD, was listed as inactive. Based on local topography, this former drycleaner is crossgradient from the LOD. All other records were either for minor air permits or were located at a significant distance from the LOD. Based on this info, impacts to the LOD are unlikely.</p>
WAS-0617	<p>The LOD is located along Oxon Hill Road (MD 414), between Thompson Lane and John Hanson Lane, in Oxon Hill, Maryland. The surrounding area is primarily commercial properties with some residential properties. Commercial development began in 1998 while residential development began prior to 1949. Development in the surrounding area continued through 2005 when the surrounding area was observed in its current configuration. Four sites located between 385 and 545 feet from the LOD were listed on one or more environmental database. Listings include a RCRA SQG generator with no known violations, two UST sites that were removed from the ground with no reported releases, and a site with three closed OCP cases for USTs that have all been removed from the ground without having releases. Based on the distance and crossgradient proximity of these sites, impacts to the LOD are unlikely.</p>
WAS-0623	<p>The LOD is located along the west side of Indian Head Highway (MD 210), north of Fort Washington Road, in Fort Washington, Maryland. The surrounding area features forested land to the north and east, and commercial properties to the south and west. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the south. Commercial development continued up until approximately 1988, when the surrounding area was observed to be developed in its current configuration. Three facilities of concern were flagged for being on one or more environmental databases. The closest, a shopping center located to the west (downgradient) of the LOD, had two 5,000-gallon heating oil USTs previously abandoned in-place excavated and removed from the site in 1995. No impacted soil was observed in the excavation and the OCP case was closed approximately one month later. A former drycleaner previously existed at the shopping center, but no violations or documented releases are associated with this former drycleaner. An Exxon gas station with a history of environmental issues was listed; however, it is located at a distance of 645 feet from the LOD in a hydraulically downgradient direction. Based on the information summarized above, impacts to the LOD are unlikely from these facilities.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0624	<p>The LOD is located along the eastern side of Indian Head Highway (MD 210), north of Fort Washington Road, in Fort Washington, Maryland. The surrounding area features forested land to the north and east, and commercial properties to the south and west. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the west. The surrounding area was observed to be in its current configuration around 1988. Several facilities of concern were identified in the surrounding area. The closest of which is a gas station with a history of environmental issues; however, this gas station is located hydraulically downgradient of the LOD. A shopping center, the Tantallon Center, had two 5,000-gallon heating oil USTs previously abandoned in-place excavated and removed from the site in 1995. No impacted soil was observed in the excavation and the OCP case was closed approximately one month later. A former drycleaner previously existed at the shopping center, but no violations or documented releases are associated with this former drycleaner. The remaining facilities are located beyond 500 feet from the LOD are thus unlikely to have an impact on the LOD.</p>
WAS-0625	<p>The LOD is located along the eastern side of Indian Head Highway (MD 210), north of Fort Washington Road, in Fort Washington, Maryland. The surrounding area features forested land to the north and east, and commercial properties to the south and west. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the west. The surrounding area was observed to be in its current configuration around 1988. Three facilities of concern were identified in the surrounding area. A gas station 325 feet from the LOD has a history of environmental issues; however, this gas station is located hydraulically downgradient of the LOD. A shopping center, the Tantallon Center, had two 5,000-gallon heating oil USTs previously abandoned in-place excavated and removed from the site in 1995. No impacted soil was observed in the excavation and the OCP case was closed approximately one month later. A former drycleaner previously existed at the shopping center, but no violations or documented releases are associated with this former drycleaner.</p>
WAS-0634	<p>The LOD is located along the west side of Indian Head Highway (MD 210), immediately south of Old Fort Road, in Fort Washington, Maryland. The surrounding area is semi-rural with some commercial and residential development which began in the early 1980s and continued through 2005, when the surrounding area was observed in its current configuration. An OCP case and a SPILLS case were identified in the surrounding area. The SPILLS case, located approximately 55 feet to the east of the LOD, involved the release of 30 gallons of diesel, some of which entered a storm drain. Clean-up efforts included a vac truck and pressure washing. The storm drain was flushed and sand was put down to absorb and residual diesel. Based on information summarized above, it is believed that majority of the diesel released was remediated. The OCP case, located 580 feet from the LOD, was opened and closed within the same day. Based on distance and status, impacts to LOD from these incidents are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0638	<p>The LOD is located along western side of Branch Avenue (MD 5), between Branch Avenue and Old Branch Avenue at Coolidge Drive, in Clinton, Maryland. The surrounding area includes Andrew's Air Force base to the east, commercial properties and forested land to the west, as well as additional commercial development to the north and south. Based on a review of historical imagery, the surrounding area was unimproved forested areas in the 1930s with some rural residential properties. Andrews Air Force Base (AFB) was constructed to the south in 1942, with commercial development and expansion of Andrews AFB continuing through 2011, when the surrounding area was observed in its current configuration. There are two sites approximately 120 feet and 180 feet west (downgradient) and southwest (crossgradient) of the LOD, respectively, with former USTs and OCP cases associated with them. However, impacts from these two sites are unlikely, based on a review of information provided by MDE through a PID request and their downgradient proximity to the LOD. The LOD is approximately 75 feet west of the Andrews AFB, which was added to the CERCLA National Priorities List in 1999. There are currently 35 Environmental Restoration Program (ERP) sites located in within Andrews AFB. Cleanup efforts include many individual sites both on and off base. Based on a review of available documents on Andrew AFB's environmental website, there is no known impacted soil and/or groundwater in the vicinity of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-0641	<p>The LOD is located in the ROW between Indian Head Highway (MD 210) and Old Palmer Road, north of Old Fort Road, in Fort Washington, Maryland. The northern end of the LOD extends west, across Indian Head Highway. The surrounding area is primarily commercial developments with some residential properties. Commercial development began prior to 1981 and is in its current configuration by 2009. There are several records of concern in the surrounding area which include five OCP cases, three SPILLS case, and three RCRA generators. The closest OCP case, located 390 feet from the LOD, involved a report of dumping, but no release was noted and the case was closed. A facility located 425 feet from the LOD had three OCP cases related to tank retrofit/repair, tank closure and new tank installation, as well as two SPILLS incidents associated with a small surface release and failed tank test, respectively. The remaining OCP and SPILL cases were beyond 500 feet from the LOD. Finally, none of the RCRA generators had any violations. Based on distances, hydraulic direction and statuses of these incidents, none are anticipated to have an impact on the LOD.</p>
WAS-0647	<p>The LOD is located primarily along the central median of Indian Head Highway (MD 210), north of Fort Washington Road, in Fort Washington, Maryland. The northern end of the LOD extends east, across the northbound lanes of Indian Head Highway. This surrounding area is primarily forested land with commercial properties to the southwest and a large residential complex to the southeast. Prior to development of the commercial properties, in the late 1960s/early 1970s, it was used for agricultural purposes. The commercial property to the southwest, the Tantallon Center, a shopping mall, was listed on the UST and OCP databases for the removal of two 5,000-gallon heating oil USTs. However, based on information provided by MDE, no impacted media was encountered during removal of these USTs. A dry cleaner was noted 410 feet from the LOD; however, no violations were reported for this facility. Based on this information, impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0649	<p>The LOD is primarily located along the central median of Branch Avenue (MD 5), north of Surratts Road, in Clinton, Maryland. The northeast portion of the LOD extends to the eastern side of Branch Avenue. The surrounding area is mixed-use commercial/residential. Residential subdivisions intermixed with forested area are located north, southwest and west of the LOD. Commercial complexes are situated to the southeast, across Surratts Road. The area was primarily agricultural land and forested areas in 1949. Commercial development began in the southeast by 1981, and residential subdivisions were under construction north and west of the LOD by 1998. The surrounding area was observed to be developed in its current configuration in 2005. One record of concern in the vicinity of the LOD was identified, an OCP case located 366 feet from the LOD, which appears to be a roadside spill that occurred on in 1987. The release was addressed and the case closed. Based on the distance and hydraulic direction (downgradient), this incident is unlikely to have an impact on the LOD.</p>
WAS-0650	<p>The LOD is primarily located along the central median of Branch Avenue (MD 5), north of and crossing the intersection with Surratts Road, in Clinton, Maryland. Portions of the LOD extend east, across Branch Avenue. The surrounding area is mixed-use commercial and residential. Residential subdivisions intermixed with forested area are located north, west and southwest of the LOD. Commercial business complexes are situated southeast of the LOD. The area was primarily agricultural land and forested areas in 1949. Commercial development began in the southeast by 1981, and residential development were under construction north and west of the LOD by 1998. The surrounding area was observed to be developed in its current configuration in 2005. One record of concern in the vicinity of the LOD was identified, an ERIS incident located 31 feet from the LOD, which appears to be a roadside spill that occurred on in 1987. The release was addressed and the case closed. Based on the incident type and date, this incident is unlikely to have an impact on the LOD. A hospital is located approximately 625 feet to the southeast of the LOD. The site has 6 former USTs and three active USTs on-site. Two OCP cases have been opened at the facility due to surficial releases and impacted subsurface material encountered during the removal of a UST. Both cases have received closure from MDE. Based on the local topography, the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely based on the distance of the site.</p>
WAS-0651	<p>The LOD is in the central median along Indian Head Highway (MD 210), north of Old Fort Road, in Fort Washington, Maryland. The surrounding area is primarily commercial developments with some residential properties. Commercial development is observed to begin prior to 1981, and is in its current configuration by 1998. There are several records of concern in the surrounding area which include five OCP cases, two SPILLS case, a UST site, and three RCRA generators. The closest OCP case, located 340 feet from the LOD, involved a report of dumping, but no release was noted and the case was closed. A SPILLS incident, located 355 feet from the LOD, involved the surface release of 30 gallons of diesel fuel which was cleaned up using sorbent dust. The remaining UST, OCP and SPILL cases were beyond 500 feet from the LOD. Finally, none of the RCRA generators had any violations. Based on distances, hydraulic direction and statuses of these incidents, none are anticipated to have an impact on the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0652	<p>The LOD is located along the western side of the Branch Avenue (MD 5) offramp to Woodyard Road, in Clinton, Maryland. The primary area of the LOD is situated in a grass area within the ROW in front of the Woodyard Crossing Shopping Center. The surrounding area is commercial, residential and forested areas. The Woodyard Crossing Shopping Center is located adjacent to the west, and the Landing Shopping Mall is situated east, across Branch Avenue. The area was primarily agricultural land and forested areas with some residential development starting south of Woodyard Road in 1949. Commercial and residential development occurred from 1981 to 2005, which the surrounding area was observed in its current configuration. Seven sites were identified in the environmental database report around the LOD. Only three sites, a commercial facility, gas station, and transformer release involved a documented release to the environment; however, these sites are between 415 and 450 feet south (downgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-0901	<p>The LOD is located along the west side of Indian Head Highway (MD 210), at Cornett Street, in Fort Washington, Maryland. The surrounding area is a mixed-use residential / commercial, with commercial properties primarily to the west and residential properties primarily to the east. The area was originally developed as agricultural land up until the 1980s, when development to the east and west began. The surrounding area was observed to be developed in its current configuration by 2005. A car dealership located west of the LOD had six former petroleum USTs ranging size from 250 gallons to 2,000 gallons. These USTs were installed in the late 1970s and removed in the early to mid-1990s. During removal of the 2,000-gallon gasoline UST petroleum odors were observed in the soils from the bottom of the excavation. The onsite MDE inspector requested that the area be over-excavated and soils tilled for several months, until PID readings from the staged soil were around 5 to 30 ppm. The excavation was then backfilled using the tilled soils and the case was closed. No information was available if four USTs of the former USTs had releases or not. The electric company located approximately 265 feet southwest of the LOD had a three USTs (two of unknown capacity containing gasoline and one 4,000-gallon gasoline) registered to the site that were excavated and removed from the site in July 1994. An OCP case was open and closed in July 1994. The UST were located at least 300 feet from the LOD. Both sites described above are anticipated to be hydraulically downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-0903	<p>The LOD is located along the west side of Indian Head Highway (MD 210), west of Christopher Court, in Fort Washington, Maryland. Forested land is observed to the north and east, and commercial properties, followed by residential properties to the west. The surrounding area was primarily developed as agricultural land up until the 1960s, when development to the west began. The surrounding area was observed in its current configuration in the early 2000s. A US Post Office facility located to the west had a 6,000-gallon heating oil UST closed in-place in 1994, a 5,000-gallon gasoline UST excavated and removed in 1996, and a previously closed-in place 5,000-gallon UST excavated and removed in 1999. Based on available information provided by MDE through a FOIA request, observations during the USTs closures, as well as analytical sampling data indicate that the former USTs did not impact soil and groundwater in the surrounding area. Further, the former USTs are believed to be at least 200 feet southwest (downgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0905	<p>The LOD is located along the western side of Indian Head Highway (MD 210), north of Swan Creek Road East, in Fort Washington, Maryland. Commercial properties with residential developments beyond are located to the north, west and south, while forested land and residential development are to the east. The surrounding area was primarily developed as agricultural land up until the 1960s, when development to the west began. The surrounding area was observed to developed in its current configuration in the early 2000s. Multiple records of concern were identified, all located either cross- or downgradient of the LOD. A US Post office located 460 feet north the LOD had four former petroleum UST removed from the site between 1994 and 1999; a gas station located 330 feet to the south had two 12,000-gallon USTs installed in 1997; and a hospital located 375 feet to the southwest had a 550-gallon diesel UST removed in 1998 but continues to have a 500-gallon diesel UST in operation. None of these UST sites have been found to have been impacted by their current or former USTs. A lumber company located 250 feet to the west had two USTs excavated and removed in October 1991. An OCP case was opened in October 1991 and was closed 3 years later in June 1994. Information provided in the database report did not state whether a release had occurred or not and a request to MDE for additional information determined their files had been deleted. Regardless, as the former USTs are located hydraulically downgradient of the LOD, impacts to the LOD are unlikely.</p>
WAS-0906	<p>The LOD is located along the western side of Indian Head Highway (MD 210), south of Christopher Court, in Fort Washington, Maryland. Commercial properties with residential developments beyond are located to the north, west and south, while forested land and residential development are to the east. The surrounding area was primarily developed as agricultural land up until the 1960s, when development to the west began. The surrounding area was observed to developed in its current configuration in the early 2000s. The US Post Office facility, located 215 feet to the west, was listed on the UST and OCP databases. Four petroleum USTs ranging in size from 5,000 gallons to 10,000 gallons were removed between 1994 and 1999. Based on information provided by MDE, observations during the USTs closures, as well as analytical sampling data, indicate that the former USTs did not impact soil and groundwater in the surrounding area. A lumber company located 250 feet to the west had two USTs excavated and removed in October 1991. An OCP case was opened in October 1991 and was closed 3 years later in June 1994. Information provided in the database report did not state whether a release had occurred or not and a request to MDE for additional information determined their files had been deleted. Regardless, as the former USTs are located hydraulically downgradient of the LOD, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0911	<p>The LOD is located along the western ROW of Indian Head Highway (MD 210), south of East Swan Creek Road, in Fort Washington, Maryland. A shopping center is located directly north of the LOD, and vacant land to the east with residential properties located further east. The surrounding area was primarily vacant forested land up until the 1980s, when commercial development to the north began in the 1980s. By 2005, the surrounding area was observed to be developed in its current configuration. A former drycleaner was located in the shopping center approximately 550 feet to the north of the LOD. The dry cleaner facility was active from 1983 until 2005. Phase I ESAs were conducted on the property in March 2000, March 2003, and March 2004. These reports identified the dry cleaning facility as a potential source of contamination to the soil and groundwater beneath the site. A Phase II ESA conducted in April 2000 confirmed the dry cleaning operations as the source of chlorinated solvents in the immediate vicinity of the dry cleaning facility. On February 8, 2001, the property was issued a No Further Requirements Determination (NFRD) allowing the property to be used for commercial or industrial purposes, and imposed groundwater use restrictions. Based on the distance of the site from the LOD and inferred groundwater flow to the west, crossgradient of the LOD, impacts to the LOD are unlikely. Two other environmental records of concern were identified, both for the generation of hazardous waste; however, neither have any documented violations and both are 400+ feet crossgradient from the LOD.</p>
WAS-0913	<p>The LOD lies along the west side of Indian Head Highway (MD 210), south of Old Fort Road, in Fort Washington, Maryland. The surrounding area was primarily forested and agricultural land up until the 1980s when a commercial development started to the northeast. The surrounding area was observed in its current configuration in 2005. Two facilities of concern were identified, both located in the commercial property northeast of the LOD. The first facility, an Exxon gas station located 384 feet from the LOD, is listed on the UST, OCP and SPILLS database and has a history of environmental issues. Subsurface petroleum impacts were first identified in May 1989 during a site assessment resulting in five USTS being removed in October 1989. Four of the USTS removed had perforations. In October 1991, a pump and treat/soil vapor extraction system was installed. This system was then expanded in June 1992 through the installation of new system wells. In May 2001, the remediation system was further expanded to include air sparging. In November 2001, during removal of the three 12,000-gallon gasoline USTs, 784.24 tons of petroleum-impacted soils were excavated. The remediation system operated until February 2003. Later in 2003, the offsite groundwater impacts were delineated and three applications of chemical oxidants were injected to remediate the offsite groundwater impacts. In July 2010, MDE closed the OCP case but noted that residual impacts remain. The second facility, an active drycleaner, is located 734 feet from the LOD. No records of any release were noted and the violations recorded were associated with administrative errors. Based on the groundwater flow direction information contained in the Exxon gas station reports, groundwater flow is to the east-northeast, which is away from the LOD. Based on this, impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0918	<p>The LOD is located along the western side of Indian Head Highway (MD 210), south of Cornett Street, in Fort Washington, Maryland. The surrounding area is mixed-use residential/commercial, with commercial properties primarily to the west and residential properties primarily to the east. The area was agricultural land up until the 1980s, when development to the east and west began. The surrounding area was observed in its current configuration by 2005. Two facilities listed on one or more environmental database was identified. A car dealership located west of the LOD had six former petroleum USTs ranging size from 250 gallons to 2,000 gallons. These USTs were installed in the late 1970s and removed in the early to mid-1990s. During removal of the 2,000-gallon gasoline UST petroleum odors were observed in the soils from the bottom of the excavation. The onsite MDE inspector requested that the area be over-excavated and soils tilled for several months, until PID readings from the staged soil were around 5 to 30 ppm. The excavation was then backfilled using the tilled soils and the case was closed. No information was available if four USTs of the former USTs had releases or not. An electric company located approximately 265 feet southwest of the LOD had a three USTs (two of unknown capacity containing gasoline and one 4,000-gallon gasoline) registered to the site that were excavated and removed from the site in July 1994. An OCP case was open and closed in July 1994. The USTs were located at least 300 feet from the LOD. Both sites described above are anticipated to be hydraulically downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-0922	<p>The LOD is located along the southeast side of Indian Head Highway (MD 210), northeast of Farmington Road East, in Accokeek, Maryland. A commercial property abuts the LOD to the east, while the remaining surrounding area is mainly forested with additional commercial structures present to the west, and residential properties to the east. Two records of concern were identified, both associated with the Piscataway Wastewater Treatment Plant; however, upon further evaluation it was determined this facility is actually located over 1,000 feet to the northeast. A release of approximately 738,000 gallons of treated water occurred in 2015, due to a breaker short circuiting. The treated water flowed into a pond area that was part of a holding tank project.</p>
WAS-0923	<p>The LOD is located in the intersection of Indian Head Highway (MD 210), Indian Head Service Road, and Farmington Road East, in Accokeek, Maryland. This area was primarily forested and cleared agricultural land until the 1980s when the Piscataway Wastewater Treatment plant was constructed. Two records of concern were identified, both associated with the Piscataway Wastewater Treatment Plant; however, upon further evaluation it was determined this facility is actually located over 1,000 feet to the northeast. A release of approximately 738,000 gallons of treated water occurred in 2015 due to a breaker short circuiting. The treated water flowed into a pond area that was part of a holding tank project.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0925	<p>The LOD is located along the northern side of Farmington Road West, west of Indian Head Highway (MD 210), in Accokeek, Maryland. Residential properties are observed to the south and east, and the Piscataway Wastewater Treatment Plant is located to the north and northwest. The surrounding area was primarily cleared agricultural land until the late 1960s when the wastewater treatment plant located to the north was constructed. The LOD and surrounding area was observed to be developed in its current configuration by the late 2000's. One facility of concern was identified, the Piscataway Wastewater Treatment Plant, which was listed on the SPILLS, ERNS, OCP, RCRA SQG, and CERCLIS databases. Fourteen USTs were previously removed. Thirteen OCPs have been opened; four for tank removals, three for petroleum releases, with the remaining being for unknown reason. The two ERNS cases were associated with minor surface releases. Most SPILLS incidents involved the release of sewage. This plant was inspected by the EPA which determined that it did not qualify for the NPL List. Although this facility is listed on multiple databases and has a significant history of incidences, based on topography, this facility is downgradient of the LOD, at a distance of 680+ feet. Based on the distance and hydraulic direction, impacts to the LOD from this facility is unlikely.</p>
WAS-0929	<p>The LOD is located along the western side of Indian Head Highway (MD 210), north of Farmington Road, in White Hall, Maryland. The surrounding area has remained as undeveloped forested land. There are no records of concern surrounding the LOD.</p>
WAS-0932	<p>The LOD lies along a median between Indian Head Highway (MD 210) and Jennifer Drive, north of Livingston Road, in Waldorf, Maryland. The surrounding area is primarily forested land with residential properties nearby to the north and east. One record of concern was listed, the US Naval Research Lab; however, upon further evaluation it was determined this record was erroneously entered as this site is located over 1.25 miles to the southeast of the LOD. Therefore, there are no records of concern near the LOD.</p>
WAS-0933	<p>The LOD is located in a median between Indian Head Highway (MD 210) and Hickory Knoll Road, north of Livingston Road, in Waldorf, Maryland. Residential properties are located to the north and west, and forested land is to the south and east. Development of the nearby residences started in the 1990s. Prior to that, it was mostly vacant forested land. One record of concern was listed, the US Naval Research Lab; however, upon further evaluation it was determined this record was erroneously entered as this site is located over 1 mile to the southeast of the LOD. Therefore, there are no records of concern near the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0934	<p>The LOD is located within a median between Indian Head Highway (MD 210) and Hickory Knoll Lane, north of Livingston Road, in Waldorf, Maryland. The area surrounding the LOD is mainly forested land with some residential properties further to the north, and large commercial structures further to the south. The area was primarily forested land up until the late 1990s when development began. The surrounding area was observed to be developed in its current configuration by 2005. An MDE VCP site is located southwest of the LOD. This site is a vacant 11 acre parcel located approximately 100 feet west of the LOD. In 1999, a UST removal at the Accokeek Gas and Go Service Station, south of the site and approximately 1,000 feet southwest of the LOD, led to the opening of an OCP case. Investigations conducted determined groundwater on the site had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In August 2009, a Phase II environmental site assessment was conducted determined that groundwater beneath the property had been impacted with elevated levels of petroleum compounds. In 2010, the owners of the site entered into the MDE VCP program and in February 2011, MDE issued a no further remediation determination for the site and the case was closed. Information on MDE's website for the site stated that surface water and groundwater on the site flows northwest (crossgradient of the LOD) towards Farmington Creek. Based on available site characterization information, the impacted groundwater is not believed to have affected the LOD.</p>
WAS-0938	<p>The LOD is located along the south side of Accokeek Road (MD 373), immediately west of Berry Road, in Accokeek, Maryland. Forested land abuts the LOD to the north and cleared vacant land to the south. The surrounding area has been primarily forested and agricultural land since the 1960s with the exception of a golf course that was located directly south of the LOD from the early 2000s to the mid-2010s. The area is currently graded vacant land. A site was plotted approximately 105-feet northwest (upgradient) of the LOD that had an 8,000-gallon diesel UST excavated and removed from the site in 1994; however, after further review the site is at least 3,000-feet to the east of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-0939	<p>The LOD is located on the south side of Accokeek Road (MD 373), between Berry and Gardner Roads, in Waldorf, Maryland. Forested land abuts the LOD to the north and cleared vacant land for agricultural purposes to the south. No records of concern were identified during this environmental review.</p>
WAS-0946	<p>The LOD is located along the central median of Branch Avenue (MD 5), north of Crain Highway (US Route 301), in Brandywine, Maryland. Forested land, commercial buildings, residential properties and a high school are to the north/northeast of the LOD; residential properties are to the east; and forest land, a road maintenance facility and an automotive parts facility are located to the south. The surrounding area was primarily agricultural and forested land up until the 1970s, when the auto park was observed to the south. One record of concern was identified, a facility owned by Verizon located approximately 550 feet northwest of the LOD. This facility had two 550-gallon heating oil USTs removed, one in 1989 and one in 1994, as well as two OCP cases associated with the UST removal closed in 1991 and 1994, respectively. No records of release or remediation was available in the database records. Based on the local topography, the Verizon facility appears crossgradient of the LOD; therefore, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0957	<p>The LOD is located along the central median of Crain Highway (US Route 301), north of Blackstone Ave/Old Indian Head Road, in Cheltenham, Maryland. The surrounding area is primarily residential properties and forested land. The surrounding area was primarily rural agricultural land up until the 1980s, when residential development began to occur to the west. The surrounding area was observed in its current configuration around 1993. One record of concern was listed, a facility located approximately 305 feet to the southeast (hydraulically downgradient) had two USTs that are reported to be closed. Based on distance and hydraulic direction, impacts to the LOD are unlikely.</p>
WAS-0968	<p>The LOD is located along the central median of Crain Highway (US Route 301), north of Oak Barrel Court, in Upper Marlboro, Maryland. A warehouse is located to the northwest, a solar plant and fairground/park to the east, forested land and an overhead power transmission line easement to the east and west, and forest land with residential properties beyond to the south. The surrounding area was primarily agricultural land up until the 1970s, when commercial development began to occur to the north. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-0969	<p>The LOD is located along the central median of Crain Highway (US Route 301), north of Oak Barrel Court, in Upper Marlboro, Maryland. An overhead power transmission line easement is located to the north followed by a solar plant, forest lands are present to the east, west and south, along with residential properties further to the southeast. The surrounding area was primarily agricultural land up until the 1970s when commercial development began to occur to the north. No records of concern were identified during this environmental review.</p>
WAS-0971	<p>The LOD is located along the central median of Crain Highway (US Route 301), south of Oak Barrel Court, in Brandywine, Maryland. The surrounding area is relatively rural. Forest land is observed to the north and west; residential properties, a motel and additional forested land to the east; and a gravel pit to the southwest along with additional forested land. Residential development continued to the east and south up until approximately 2009, when the surrounding area was observed in its current configuration. The motel has a registered 1,000-gallon heating oil UST located on the southeastern portion of the property, which based on a boiler smokestack observed on the southeastern structure in aerial photograph, is located on the southeastern portion of the property. No releases have been reported in regard to this UST, as well as the site is located hydraulically downgradient of the LOD. A SHWS LRP site, located approximately 585 feet southwest of the LOD, is an old gravel pit with three OCP cases also associated with it. The site is both downgradient and hydraulically disconnected from the LOD; therefore, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0972	<p>The LOD is located along the east side of Crain Highway (US Route 301), west of Oak Barrel Court, in Brandywine, Maryland. The surrounding area is relatively rural. Forest land is observed to the north and west; residential properties, a motel and additional forested land to the east; and a gravel pit is observed to the south along with additional forested land. Residential development continued to the east and south up until approximately 2009, when the surrounding area was observed in its current configuration. The motel has a registered 1,000-gallon heating oil UST located on the southeastern portion of the property, based on a boiler smokestack observed on the southeastern structure in aerial photograph, approximately 200 feet downgradient of the LOD. No releases have been reported in regard to the UST, as well as the site is downgradient of the LOD; therefore, impacts to the LOD are unlikely. A SHWS LRP site, located approximately 1,300 feet southwest of the LOD, is an old gravel pit with three OCP cases also associated with it. The site is both downgradient and hydraulically disconnected from the LOD; therefore, impacts to the LOD are unlikely.</p>
WAS-0975	<p>The LOD is located along the western side of Crain Highway (US Route 301), north of an unnamed access road leading to a gravel pit, in Brandywine, Maryland. The surrounding area is relatively rural. Forest land is observed to the north and west; residential properties, a motel and additional forested land to the northeast; and a residential property with additional forested land to the south. Residential development continued to the east and south up until approximately 2009, when the surrounding area was observed in its current configuration. Two records of concern were identified. The first is a SHWS LRP site is located approximately 475 feet southwest of the LOD. The site is an old gravel pit, with three OCP cases also associated with it. Based on local topography, the gravel pit appears hydraulically crossgradient from the LOD; therefore, impacts to the LOD are unlikely. The second record of concern is an AST site located 365 feet from the LOD associated with a company specializing in used oil. The site has two 20,000-gallon used oil ASTs and one 1,000-gallon diesel AST. The ASTs were located in secondary containment systems based on aerial photographs. Additionally, no violations, spills/releases, or OCP cases associated with the facility were identified. Based on this information, impacts to the LOD from the used oil facility is unlikely.</p>
WAS-0980	<p>The LOD is along the western side of Piscataway Road (MD 223), between Joseph Drive and Lazy Acres Road, in Clinton, Maryland. The surrounding area is semi-rural/suburban, with residential properties located to the north and west, and forested and cleared lands to the northeast, east, and south. The surrounding area was primarily utilized as agricultural land up until the early 1970s, when residential development began to occur to the north and west. By 1988, the surrounding area was observed in its current configuration. Three records of concern were identified; two OCP cases and one Spills case; however, these incidents are 295 feet or greater from the LOD and are located either hydraulically downgradient or crossgradient. Thus, impacts to the LOD are not expected from these incidents.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0987	<p>The LOD is located along the central median of Branch Avenue (MD 5), north of Earnshaw Drive, in Brandywine, Maryland. The surrounding area is observed to be primarily forest land and residential properties, with the exception of a plant nursery to the southwest. The surrounding area was primarily agricultural and forested land up until the 1970s, when residential development began to the east/southeast and continued through the late 1980s. The plant nursery to the southwest was observed to be present by 1988, when the LOD and surrounding area were observed to be developed in their current configuration. An OCP case was opened on 09/24/2004 at a property 350 feet southeast (crossgradient) of the LOD, due to dumping that resulted to a release. The material was addressed and the case was closed approximately 2 months later on 12/9/2005. Based on the local topography, the site appears hydraulically crossgradient of the LOD. A second OCP case was opened 650 feet to the east (crossgradient) in response to a ground seep investigation in 2003. No release was identified and the case was closed the same day. Based on distance any hydraulic direction, impacts to the LOD from the OCP are unlikely.</p>
WAS-0988	<p>The LOD is located along the central median of Branch Avenue (MD 5), between Earnshaw Drive and Piscataway Creek, in Brandywine, Maryland. The surrounding area is observed to be primarily forest land with residential properties beyond. The surrounding area was primarily agricultural and forested land up until the 1970s, when residential development began to the east/southeast and continued through the late 1980s. By 1988, the LOD and surrounding area were observed to be developed in their current configuration. An OCP case was opened to 655 feet to the southeast (crossgradient) in response to a ground seep investigation in 2003; however, no release was identified and the case was closed the same day. Thus, impacts to the LOD from this OCP are unlikely.</p>
WAS-0989	<p>The LOD is located along the central median of Branch Avenue (MD 5), north of the Piscataway Creek, in Brandywine, Maryland. The surrounding area is observed to be primarily forested land, with residential properties to the northwest and southeast. The surrounding area was primarily forested land up until the 1970s, when residential development began to the east/southeast. An overhead power transmission line easement runs east to west through the northern portion of the LOD, which was also observed to be present in the early 1970s. A residential development to the west began to be developed in the early 2010s was observed to have been completed by 2018. No records of concern were identified during this environmental review.</p>
WAS-0990	<p>The LOD is located along the central median of Branch Avenue (MD 5), north of the Piscataway Creek bridge, in Clinton, Maryland. The southern end of the LOD extends east, across Branch Avenue. The surrounding area is observed to be primarily forested land, with residential properties to the west. The surrounding area was primarily forested land up until the 1970s, when an overhead power transmission line easement was constructed south of LOD. A residential development to the west began in the early 2010s was observed to have been completed by 2018. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-0992	<p>The LOD is located along the west side of Piscataway Road (MD 223), north of Floral Park Road, in Clinton, Maryland. Forested land is observed to the north and east; residential properties to the south; and a cemetery, church and school to the west. The surrounding area has remained primarily unchanged since the 1980s, with the exception of the residential development to the southeast of the LOD that was constructed beginning in 2006. The adjacent church to the west had a 550-gallon heating oil UST excavated and removed in 1992. There are no indications that a release occurred and the case was closed within 2 months. A farm located to the south of the LOD had a 1,000-gallon gasoline UST located approximately 800 feet south of the LOD. In 2002, this UST was excavated and removed. Impacted material was encountered and approximately 34 tons of impacted soil was removed and disposed offsite. After the impacted soil had been removed confirmation sampling and test pitting was conducted to determine the extent any remaining subsurface impacts. Based on the results of the investigation, it was determined that any impacts were isolated to immediate area around the former UST. In 2005, the site was redeveloped as a townhome community and any additional impacted subsurface material was most likely addressed during its construction. Based on the distance of these sites, impacts to the LOD are unlikely.</p>
WAS-0996	<p>The LOD is located along the west side of Crain Highway (US Route 301), north of Oak Barrel Court, in Brandywine, Maryland. A warehouse is located to the northwest, a solar plant and fairground/park to the east, forested land and an overhead power transmission line easement (approximately 1971) to the east and west, along with additional forested land to the south, followed by residential properties. The surrounding area was primarily agricultural land up until the 1970s when commercial development began to occur to the north. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-0999	<p>The LOD lies along the west side of Indian Head Highway (MD 210), between Livingston Road and Fort Washington Road, in Fort Washington, Maryland. The area surrounding the LOD was primarily forested land until the late 1970s when commercial property was developed to the north. Residential properties were developed to the late 1990s. Forested land is still observed on the adjoining property to the west. Two commercial properties located to the north of the LOD were listed on the UST and OCP databases. The first facility, Dotson Electric Company located 316 feet from the LOD, had three USTs removed in 1994. The second facility, Winegardner Chevrolet located 535 feet from the LOD, had six USTs removed between 1990 and 1994. Both of these facilities appear hydraulically crossgradient from the LOD. Based on distances and hydraulic direction, impacts to the LOD from these facilities are unlikely.</p>
WAS-1003	<p>The LOD lies along both the north and south sides of Accokeek Road (MD 373), west of Leonard Drive, in Waldorf, Maryland. The area to the north is forested land with residential properties to the northeast, and agricultural land to the south. The area surrounding the LOD has been in its current configuration since the 1980s. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-1004	<p>The LOD is located along the central median and eastern side of Indian Head Highway (MD 210), north of Livingston Road, in Accokeek, Maryland. The area was primarily forested land until the late 1980s, when development was observed to the south. An MDE VCP site is located southwest of the LOD. This site is a vacant 11 acre parcel located approximately 360 feet west of the LOD. In 1999, a UST removal at the Accokeek Gas and Go Service Station, south of the site and approximately 1,000 feet southwest of the LOD, led to the opening of an OCP case. Investigations conducted determined groundwater on the site had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In August 2009, a Phase II environmental site assessment was conducted determined that groundwater beneath the property had been impacted with elevated levels of petroleum compounds. In 2010, the owners of the site entered into the MDE VCP program and in February 2011, MDE issued a no further remediation determination for the site and the case was closed. Information on MDE's website for the site stated that surface water and groundwater on the site flows northwest (crossgradient of the LOD) towards Farmington Creek. Based on available site characterization information, the impacted groundwater is not believed to have affected the LOD.</p>
WAS-1005	<p>The LOD is located along the central median and eastern side of Indian Head Highway (MD 210), north of Livingston Road, in Accokeek, Maryland. The area was primarily forested land until the late 1980s, when development was observed to the south. An MDE VCP site is located southwest of the LOD. This site is a vacant 11 acre parcel located approximately 360 feet west of the LOD. In 1999, a UST removal at the Accokeek Gas and Go Service Station, south of the site and approximately 1,000 feet southwest of the LOD, led to the opening of an OCP case. Investigations conducted determined groundwater on the site had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In August 2009, a Phase II environmental site assessment was conducted determined that groundwater beneath the property had been impacted with elevated levels of petroleum compounds. In 2010, the owners of the site entered into the MDE VCP program and in February 2011, MDE issued a no further remediation determination for the site and the case was closed. Information on MDE's website for the site stated that surface water and groundwater on the site flows northwest (crossgradient of the LOD) towards Farmington Creek. Based on available site characterization information, the impacted groundwater is not believed to have affected the LOD.</p>
WAS-1006	<p>The LOD is located along Indian Head Highway (MD 210), north of Indian Hill Road, in Accokeek, Maryland. The northern end of the LOD extends easterly, across Indian Head Highway. The area surrounding is primarily forested land. In 2009, the area to the south of the LOD was cleared and developed with residential properties. No records of concern were identified during this environmental review.</p>
WAS-1007	<p>The LOD lies along primarily the eastern side of Indian Head Highway (MD 210), as well as part of the central median, south of Indian Hill Road, in Accokeek, Maryland. The area surrounding the LOD is mostly forested land to the north and south, with residential properties to the south and east. Development of the residential properties to the south and east was observed between 1998 and 2018. No records of concern were identified during this environmental review</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-1009	<p>The LOD lies along the eastern side of Indian Head Highway (MD 210), approximately 1,900 feet north of The Mall, in Accokeek, Maryland. The center part of the LOD extends easterly. The area surrounding the LOD has been and remains primarily vacant forested land. Piscataway creek is located north and west of the LOD. No records of concern were identified during this environmental review.</p>
WAS-1010	<p>The LOD lies primarily in the center median of Indian Head Highway (MD 210), north of Old Fort Road, in Fort Washington, Maryland. The northern end of the LOD extends east, across Indian Head Highway. The area surrounding is mostly forested lands with residential properties to the east and west. Residential development to the east occurred prior to 1960, while residential development to the west occurred in the early 1980s. By the mid-2000s, the surrounding area is developed in its current configuration. Two records of concern were listed in the database, one of which was a drycleaner incorrectly mapped as being in the residential neighborhood to the southwest. The other record is associated with a 70-gallon release of heating oil at a residence 582 feet northeast (upgradient) of the LOD. Based on the distance of this release incident, impacts to the LOD are unlikely.</p>
WAS-1011	<p>The LOD lies primarily in the center median of Indian Head Highway (MD 210), north of Old Fort Road, in Fort Washington, Maryland. The northern portion of the LOD extends east, across Indian Head Highway. The area surrounding the LOD is mostly forested land, with residential properties to the southeast and west. By 1981, the surrounding area is developed in its current configuration. Three records of concern were identified, all associated with surface releases. Releases of approximately 30 gallons of heating oil occurred 110 feet to the west (downgradient), 70 gallons of heating oil to the east (upgradient), and an unknown volume of heating oil from a leaking AST occurred 620 feet to the west. Based on either the distance of the incident from the LOD, hydraulic direction, and/or release volume, impacts to the LOD are unlikely.</p>
WAS-2003	<p>The LOD is located along the western side of Kenilworth Avenue (MD 201), north of Decatur Street, in Hyattsville, Maryland. The surrounding area is mixed-use commercial, residential and open spaces. Apartment and townhouse buildings are located north and west of the LOD, and commercial businesses are situated south and east, across Kenilworth Avenue. The area was primarily residential properties and forested land in 1937. Following development of the adjacent property to the west as townhomes in 1994, the surrounding area became developed in its current configuration. Thirteen facilities were flagged on being on one or more environmental databases, including RCRA SQG/NON GEN, UST, OCP, ERNS, FINDS/FRS, HMIRS and ALT FUELS databases. The closest facility, the Neils Auto Parts store located directly across Kenilworth Avenue, was listed as a small quantity generator, likely for the acceptance of spent automotive batteries and/or solvents. No violations were reported and automotive repairs do not occur at this facility. Based on this info, impacts to the LOD from this facility are unlikely. The remaining 12 flagged facilities were located 330 feet or greater from the LOD, and are not expected to have any impact on the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2004	<p>The LOD is located along the western side of Kenilworth Avenue (MD 201), north of Decatur Street, in Hyattsville, Maryland. The surrounding area is mixed-use commercial, residential and open spaces. Apartment and townhouse buildings are located north and west of the LOD, and commercial businesses are situated south and east, across Kenilworth Avenue. The area was primarily residential properties and forested land in 1937. Following development of the adjacent property to the west as townhomes in 1994, the surrounding area became developed in its current configuration. Thirteen facilities were flagged on being on one or more databases, including RCRA SQG/NON GEN, UST, OCP, FINDS/FRS, HMIRS and ALT FUELS databases. The closest facility, the Neils Auto Parts store located directly across Kenilworth Avenue, was listed as a small quantity generator, likely for the acceptance of spent automotive batteries and/or solvents. No violations were reported and automotive repairs do not occur at this facility. Based on this info, impacts to the LOD from this facility are unlikely. A former gas station, located 288 feet crossgradient from the LOD, previously had five USTs and three OCP cases assigned to it. The USTs were removed between 1993 and 2002. No reports of releases were noted, and no USTs remain. Based on the distance and hydraulic direction, this former gas station is unlikely to have an impact on the LOD. The remaining 11 flagged facilities were located 375 feet or greater from the LOD, and are not expected to have any impact on the LOD.</p>
WAS-2010	<p>The LOD is located along the western side of Edmonston Road (MD 201), north of Crescent Road, in Greenbelt, Maryland. The general area consists of a mix of commercial and residential development. The surrounding area was primarily developed rural agricultural up until the early 1970s, when residential development began to occur to the east. Commercial development to the west began in the early 1980s and continued through 2005, when the surrounding area was observed in its current configuration. A Maryland State Highway Administration facility, located approximately 180 feet to the west (crossgradient), was listed as having three 4,000-gallon USTs (two diesel and one gasoline) that impacted soils onsite between 1991 and 1998. Impacted soil was addressed and the cases were eventually closed. Currently, the site has two 4,000-gallon gasohol USTs located approximately 415 feet west (crossgradient) of the LOD. In 2017, a spill of approximately 8-gallons of hydraulic fluid was released approximately 40 feet south (downgradient) of the LOD. Based on the distance and hydraulic directions of these sites/ incidents, impacts to the LOD are unlikely.</p>
WAS-2018	<p>The LOD is located in the northeast portion of the Baltimore Avenue (US-1) and University Boulevard (MD-193) interchange, in College Park, Maryland. The surrounding area consists primarily of residential development, which occurred from the 1900s to the 1920s. No records of concern in the vicinity of the LOD that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2019	<p>The LOD is located in the northwest portion of the Baltimore Avenue (US-1) and University Boulevard (MD-193) interchange, in College Park, Maryland. The surrounding area consists primarily of residential development, which occurred from the 1900s to the 1920s. Commercial development is located on each side of US-1, and the Paint Branch River is located to the west. Two facilities listed on multiple environmental databases were identified in the surrounding area. The first facility, the MNCPPC Paint Branch Golf Course, was mapped as being located approximately 570 feet west the LOD; however, on further review this site is located over 1,100 feet northwest. The second facility, Jenkins Garage, is located greater than 600 feet south of the LOD. Based on these distances, these facilities are unlikely to have an impact on the LOD.</p>
WAS-2022	<p>The LOD is located along the southern side of Queens Chapel Road (MD 500), immediately west of 21st Street, in Mount Rainier, Maryland. The surrounding area is a mix of residential and commercial properties. Development of the surrounding area occurred prior to 1963. Two facilities of concern were listed in the database, an OCP case located approximately 1,800 feet east of the LOD and a dry cleaner 595 feet southwest (downgradient) of the LOD. Based on distance and hydraulic direction, impacts to the LOD from these facilities are unlikely.</p>
WAS-2023	<p>The LOD is located along the southern side of Queens Chapel Road (MD 500), immediately east of 21st Street, in Mount Rainier, Maryland. The surrounding area is a mix of residential and commercial properties. Development of the surrounding area occurred prior to 1963. One record of concern was listed in the database, an OCP case; however, it was incorrectly mapped as being near the LOD. The actual distance is approximately 1,550 feet east of the LOD. Based on this distance, impacts to the LOD from this facility are unlikely.</p>
WAS-2024	<p>The LOD is located along the northern side of Queens Chapel Road (MD 500), east of Eastern Avenue NE, in Mount Rainier, Maryland. The surrounding area is a mix of commercial and residential properties. Development of the surrounding area occurred prior to 1960, as the surrounding area is observed its current configuration in the 1960 aerial photograph. Two facilities of concern were identified. The first facility, a realty office located 335 feet from the LOD, was listed on the OCP database for unspecified purposes. The OCP case remains open. The second facility, a drycleaner located 430 feet from the LOD, was listed on the CERCLIS, FED DRYCLEANERS, RCRA NON GEN, FINDS/FRS, ICIS and SEMS ARCHIVE databases. Environmental impacts appear to have been present at this facility. Although the OCP case associated with the realty office remains open, and impacts appear to have been present at the drycleaner, both of these facilities are located hydraulically downgradient of the LOD and at a significant distance. Thus, impacts to the LOD from the facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2025	<p>The LOD is located along the south side of Queens Chapel Road (MD 500), east of 25th Street, in Mount Rainier, Maryland. The surrounding area is a mix of commercial and residential developments, which began around in 1963 and continued through 2009 when the surrounding area was observed in its current configuration. Eleven sites in the surrounding area were listed on one or more environmental database. Of these, four were apartment complexes listed between 315 feet and 470 feet from the LOD that were listed on the UST and OCP databases. Based on a review of available information provided by MDE through a PIA request or their hydraulic direction from the LOD, impacts to the LOD from these apartment complexes are unlikely. The remaining listed sites either did not involve releases or were located at a sufficient distance from the LOD where impacts to the LOD would be unlikely.</p>
WAS-2026	<p>The LOD is located along the south side of Queens Chapel Road (MD 500), east of 27th Street, in Mount Rainier, Maryland. The surrounding area is a mix of commercial and residential developments, which began around in 1963 and continued through 2009, when the surrounding area was observed in its current configuration. Fourteen sites in the surrounding area were listed on one or more environmental database. Of these, three were apartment complexes listed between 160 feet and 300 feet from the LOD that were listed on the UST and OCP databases. Based on a review of available information provided by MDE through a PIA request or their hydraulic direction from the LOD, impacts to the LOD from these apartment complexes are unlikely. The remaining listed sites either did not involve releases or were located at a sufficient distance from the LOD where impacts to the LOD would be unlikely.</p>
WAS-2027	<p>The LOD is located along the east side of Queens Chapel Road (MD 500), between 30th Street and Buchanan Street, in Mount Rainier, Maryland. The surrounding area is a mix of commercial and residential properties, which began prior to 1963. The surrounding area is observed to be in its current configuration by 2017. There are several database listings in the vicinity of the LOD. Several sites did not have releases or are located at a distance from the LOD where impacts are unlikely. Two apartment complexes and spills within 225 feet of the LOD were identified as having registered former and current USTs, OCP cases, and reported releases; however, based on a review of available information provided by MDE through a PIA request, impacts are either isolated to the properties or the sites are hydraulically downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-2028	<p>The LOD is located along the western side of Queens Chapel Road (MD 500), between 30th Street and Buchanan Street, in Mount Rainier, Maryland. The surrounding area is a mix of commercial and residential developments which began prior to 1963. The surrounding area is observed in its current configuration by 2017. There are 16 database listings in the vicinity of the LOD. Of these, 14 did not involve releases or were located at a sufficient distance from the LOD where impacts are unlikely. Two apartment complexes within 295 feet of the LOD were identified as having registered former and current USTs, OCP cases and reported releases; however, based on a review of available information provided by MDE through a PIA request, impacts were either isolated to the properties or the sites are downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2029	<p>The LOD is located along the western side of Queens Chapel Road (MD 500), south of Chillum Road, in Mount Rainier, Maryland. The surrounding area is a mix of commercial and residential developments, which began prior to 1963. The surrounding area is observed in its current configuration by 2017. There are 20 database listings in the vicinity of the LOD. Of these, 17 sites did not have releases or are located at a distance from the LOD where impacts are unlikely. Two gas stations and an apartment complex, between 100 and 395 feet of the LOD have registered former and current USTs, OCP cases and reported releases; however, based on a review of available information provided by MDE through a PIA request, impacts are either isolated to the properties or the sites are downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-2030	<p>The LOD is located in the along the western side Queens Chapel Road (MD 500), immediately south of Chillum Road (MD 501), in Mount Rainier, Maryland. The surrounding area is a mix of commercial and multifamily residential complexes, which began prior to 1963. Commercial development in the area continued through 2009, when the surrounding area was observed in its current configuration. There are 16 database listings in the vicinity of the LOD. Of these, 13 sites did not have releases or are located at a distance from the LOD where impacts are unlikely. Two gas stations and an apartment complex, all within 250 feet of the LOD, have registered former and current USTs, OCP cases and reported releases; however, based on a review of available information provided by MDE through a PIA request, impacts are either isolated to the properties or the sites are downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-2035	<p>The LOD is located along southern side of Queens Chapel Road (MD 500), northeast of Hamilton Road, in Hyattsville, Maryland. The surrounding area is a mix of commercial and residential properties, with some forested land southwest of the LOD. Development of the surrounding began prior to 1963, and was observed in its current configuration by 1994. Eight sites of concern listed on one or more environmental database were identified in the surrounding area. The most concerning is a Shell gas station located 185 feet west of the LOD. This gas station has a history of environmental issues; however, based on site-specific information provided by MDE through a PIA request, the groundwater flow direction is to the southeast. Based on this groundwater flow direction, the historical impacts at this gas station are unlikely to impact the LOD. The remaining seven sites of concern either did not involve a release or were located at a sufficient distance from the LOD where impacts to the LOD are unlikely.</p>
WAS-2036	<p>The LOD is located along the southern side of Queens Chapel Road (MD 500), approximately 230 feet northeast Hamilton Road, in Hyattsville, Maryland. The surrounding area is a mix of commercial and residential developments, which occurred prior to 1963. The surrounding area is observed to be in its current configuration by 1994. Seven facilities listed on one or more environmental databases were identified. A facility utilizing a 10,000-gallon heating oil UST is located upgradient of the LOD; however, the UST was determined to be located approximately 445 feet from the LOD. The remaining six facilities of concern were all located downgradient to crossgradient of the LOD. Based on distance or hydraulic direction, impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2037	<p>The LOD is located along the southern side of Queens Chapel Road (MD 500), immediately northeast of Jefferson Street, in Hyattsville, Maryland. The surrounding area is a mix of commercial and residential developments, which occurred prior to 1963. Six facilities listed on one or more environmental databases were identified. A facility utilizing a 10,000-gallon heating oil UST is located upgradient to crossgradient of the LOD; however, the UST was determined to be located approximately 355 feet from the LOD. The remaining five facilities of concern were all located downgradient to crossgradient of the LOD. Based on distance or hydraulic direction, impacts to the LOD from these facilities are unlikely.</p>
WAS-2038	<p>The LOD is located along Queens Chapel Road (MD 500), north of Madison Street, in Hyattsville, Maryland. The southern end of the LOD extends west, across the south-bound Queens Chapel Road lanes, while the center portion of the LOD extends east, into the adjacent property. The surrounding area is primarily residential, which began prior to 1963. The surrounding area is observed to be in its current configuration by 1994. Two records of concern were identified in the surrounding area; however, neither are expected to have an impact on the LOD. The first record, the adjacent Sacred Heart Home, previously had an 8,000-gallon heating oil UST fail a tightness test in 1987. A visual leak was observed within the manway; however, according to the records the leaking product had not reached the surrounding soils. Following repairs, the tank was retested and passed. The UST was removed from the ground in 1992. The second record, a vehicle accident occurring 405 feet from the LOD, resulted in a release and cleanup efforts. The associated OCP case was closed approximately 3 months later.</p>
WAS-2042	<p>The LOD is located primarily within a center median of Queens Chapel Road (MD 500), between Oglethorpe Street and Oliver Street, in Hyattsville, Maryland. The northeastern end of the LOD extends east and west, across Queens Chapel Road. The surrounding area is primarily residential, which began prior to 1963. The surrounding area is observed to be in its current configuration by 1994. Four petroleum release incidents were identified, with the closest being a SPILLS incident involving a release of No. 2 fuel oil to the ground surface from a corroded AST. The remaining SPILLS or OCP cases that involved petroleum releases occurred greater than 600 feet from the LOD. Further, all release incidents occurred either cross or downgradient from the LOD. Based on distance and hydraulic direction, impacts to the LOD from these release incidents are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2043	<p>The LOD is primarily located in the center medium of Queens Chapel Road (MD 500), approximately 630 feet southwest of East West Highway (MD 410) in Hyattsville, Maryland. The surrounding area is a mix of commercial and residential developments. Development of the surrounding area begin prior to 1963, and is observed in its current configuration by 2005. Fifteen facilities located between 35 feet and 645 feet from the LOD were listed on one or more of the following databases: OCP, SPILLS, UST, RCRA Generator, VCP, LUC, SHWS, Drycleaner and Fed Drycleaner. Of these, only two facilities were located within 300-feet of the LOD. The closest facility, the United Methodist Church located adjacent to the west, was listed on the UST, OCP and SPILLS databases. In 2012, an 8,000-gallon heating oil tank was removed. The OCP record associated with this UST closure states a release had not occurred. An older OCP case was opened in 1987 for unknown reasons, but the case was closed one month later indicating it was minor in nature. The SPILLS case involved the release of 15 gallons of hydraulic fluid from an electrical transformer, which was contained with the transformer vault. Based on this information, impacts to the LOD from the church are unlikely. The second facility, a residence located 260 feet downgradient of the LOD, had an OCP case opened in 1991 for unknown reasons; however, the case was closed within one week. Of the facilities beyond 300 feet from the LOD, the only notable case is a former drycleaner that is listed on the Drycleaners, FED DRYCLEANER, SHWS, VCP, LUC, and RCRA Generator databases. However, this facility has been issued a No Further Action (NFA) determination and the land use controls (LUCs) are limited to the type of operations that may occur at the facility. Based on the distance (510 feet), impacts to the LOD from this former drycleaner are unlikely. The remaining facilities are not expected to have any impact on the LOD based on either their case status, distance or hydraulic direction.</p>
WAS-2056	<p>The LOD is located along East West Highway (MD 410), between 46th and 47th Avenues, in Riverdale Park, Maryland. The surrounding area is a mix of commercial and residential developments. Development of the surrounding area is observed to begin prior to 1963, and is observed in its current configuration by 2005. Although there are 11 sites with database listings in the vicinity of the LOD, all either did not involve releases or are located at a sufficient distance from the LOD where impact to the LOD is unlikely. The closest site, a residence located 190 feet west of the LOD, had an ERNS case due to the release of 100 gallons of no. 2 fuel oil from an AST. According to available information provided in the environmental database report, the responsible oil company used absorbent pads to clean up the material. Based on local topography the site appears located downgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2057	<p>The LOD is located along the northern side of Riggs Road (MD 212), west of the Red Top Road, in Hyattsville, Road. The surrounding area is a mix of commercial and residential developments. Residential development of the surrounding area began prior to 1949, while commercial development began 1971. The surrounding area is observed in its current configuration by 1988. A fire station, located directly west of the LOD, had a 4,000-gallon gasoline UST excavated and removed in 1984. The UST was found to be in good condition and only a small amount of impacted material was encountered around the vent pipe, which was addressed. A new 4,000-gallon UST was installed in its place, which was subsequently excavated and removed in 2000. The UST was found to be in good condition and no impacted soil or odors were observed in the excavation. A PID reading taken from the approximately 2 feet below the grade of the UST was recorded at 3.3 ppm. A soil sample was collected and analyzed for TPH-GRO, which was non-detect. The excavation was backfilled and the case was closed shortly thereafter. Based on the information available for review, impacts to the LOD are unlikely.</p>
WAS-2062	<p>The LOD is located along the southern side of Hamilton Street, 70 feet east of 35th Place, in Hyattsville, Maryland. The surrounding area is a mix of commercial and residential developments. Development of the surrounding area begun prior to 1963 and is observed in its current configuration by 1988. Four facilities listed on one or more environmental database were identified. The closest, an OCP case located 140 feet hydraulically crossgradient from the LOD, was associated with a leaking residential heating oil AST. The MDE inspector estimated 0.5 gallons of heating oil was released to the ground surface. A follow-up inspection occurring 6 days later noted new AST and product line installed. The remaining three facilities of concern were located between 395 and 540 feet from the LOD in either a downgradient or crossgradient direction. Based on this, impacts to the LOD from these facilities are unlikely.</p>
WAS-2063	<p>The LOD runs east-west, starting from the western side of 38th Avenue across 38th Avenue and through a grassy area between properties 5023 and 5025 38th Avenue, in Hyattsville, Maryland. The surrounding area is primarily residential, which was developed prior to 1963. The adjacent apartment complex along the western side of 38th Street was listed on the UST and OCP databases for the removal of a 5,000-gallon heating oil UST in 1992. Inspection of the pulled tank by an MDE inspector did not find any perforations, and screening of the soils beneath the former UST with a PID identified a maximum reading of only 22.2 ppm. Based on this information, the MDE inspector recommended closure of the OCP case. The remaining flagged facilities were listed at distances beyond 500 feet from the LOD. Based on either case status or distance from the LOD, impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2064	<p>The LOD is located along the northern side of Chillum Road (MD 501), between 10th Place and Twin Oak Drive, in Chillum, Maryland. The surrounding area is primarily residential with a few commercial properties. Development of the surrounding area started prior to 1949, and was viewed in its current configuration in 2017, following expansion of a commercial property northeast of the LOD. The apartment complex to the west/southwest had four 6,000-gallon heating oil USTs closed in 1999, one for each apartment building. Three USTs were closed via excavation and one via abandonment in-place. Soil screening/sampling beneath the USTs did not identify any impacts of concern, and the OCP case was closed. An additional OCP case was listed 445 feet to the east, but no actual release was reported and the case was closed. Thus, impacts are unlikely.</p>
WAS-2066	<p>The LOD is located along the south side of Chillum Road (MD 501), west of 21st Place, in Hyattsville, Maryland. The surrounding area is a mix of residential and commercial properties, which mostly occurred by 1963. The Washington Gas/Chillum Station, located across Chillum Road, is a former natural gas terminal. This terminal had seven USTs ranging in size from 6,000 to 10,000 gallons. In 1990, two 10,000-gallon gasoline USTs and one 8,000-gallon gasoline UST were removed. In 2001, two 6,000-gallon gasoline USTs, one 10,000-gallon gasoline UST and one 10,000-gallon diesel UST were removed. According to a summary report from 2001, the USTs were associated with a fueling area in the northeastern portion of the facility. Approximately 690 tons of petroleum impacted material was excavated and removed from the site along with the USTs. Soil and groundwater investigations indicated that a petroleum groundwater plume was present onsite and moving to the north/northeast towards an adjacent stream, downgradient of the LOD. A free product recovery system was to be implemented onsite; however, only one well was found to have any free product in it and the system was therefore shut down. Based on the site characterization efforts, MDE granted closure to the site in 2002. In addition, while not noted in the database, two large gaseous natural gas ASTs, measuring 303 feet in diameter by 171 feet tall were in operation from the 1930's through 1999. While the address is mapped as 230 feet, the property extends a significant distance along Chillum Road. The former gaseous ASTs are located approximately 275 to 300 feet from the LOD, while the former USTs are likely located between 350 feet from the LOD. A pipeline incident was also reported in 1994. No information was available regarding this incident other than "operating error." This facility also had a 15-gallon release of hydraulic fluid to the surface due to equipment failure. The release was cleaned up. Finally, while currently listed as a RCRA CESQG, the facility was formerly an LQG. While this facility has a long history of storage of petroleum products, it is located hydraulically downgradient of the LOD, and thus is unlikely to have an impact on the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2073	<p>The LOD is located along the central median of Annapolis Road (MD 450), east of 65th Avenue, in Hyattsville, Maryland. The surrounding area is primarily developed with retail and fast food businesses. The area was generally developed in the 1960s; a shopping center north of the LOD was redeveloped into a big box store with pad restaurants in the 2000s. A former auto service shop located within the Montgomery Ward Plaza had a 550-gallon waste oil UST removed in 1990 as well as 18 hydraulic vehicle lifts in 2004; however, the site was found to be approximately 845 feet north of the LOD. A former gas station was located approximately 185 feet southwest (crossgradient) of the LOD. Based on available data, impacts from the former gas station are not believed to have impacted the LOD based on the groundwater flow to the south/southwest. A dry-cleaning facility is located approximately 135 feet south (downgradient) of the LOD. Impacts to the LOD are unlikely based on these site's down- to crossgradient proximity to the LOD.</p>
WAS-2075	<p>The LOD is located along the southern side of Annapolis Road (MD 450), just west of the I-495 overpass, in New Carrollton, Maryland. The surrounding area is a mix of commercial and residential developments, which began prior to 1964 and is observed in its current configuration by 1993. The area surrounding the LOD includes a gas station auto service center and several other sites with database listings, however most sites did not experience releases or are located around 600 feet downgradient from the LOD. One OCP case, located approximately 120 feet crossgradient from the LOD, was opened for a vehicular accident in 2004 at the intersection of I-495 and Annapolis Road. The release was addressed/ cleaned up and the case was closed approximately one week later. The release was most likely surficial in nature. Therefore, based on the proximity and release type, impacts to the LOD are unlikely.</p>
WAS-2076	<p>The LOD is located in the south side of John Hanson Highway (US Route 50), west of Veterans Highway (MD 410) overpass, in Hyattsville, Maryland. John Hanson Highway and a portion of the future MD 410 were constructed in the 1960's, and the intersection was reconstructed into its current configuration along with extended/widened of MD 410 in the early 1990's. The LOD consists mostly of trees, along with a portion of the eastbound lane of John Hanson Highway. The LOD is surrounded by residential development to the north, mostly built by 1960, and a railroad and commercial development to the south, built in the 1970's and 1980's. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-2078	<p>The LOD is located on the west side of New Hampshire Avenue (MD 650), south of Overlook Drive, in Silver Spring, Maryland. Single family residential dwellings, mostly developed by 1960, surround the LOD to the west, north and south, and commercial development, occurred mainly in the 1980s, is to the south. An office building is located immediately west of the southern portion of the LOD, multiple gas stations are present to the south. Nine facilities in the surrounding area were listed on one or more environmental database; however, based on the type of release (e.g., sewage) or hydraulic direction from the LOD (i.e., downgradient / crossgradient), impacts to the LOD are unlikely. A gas station with an OCP case involving a release is located 160 feet cross-gradient from the LOD, based on available information provided by MDE, impacts to are unlikely based on its crossgradient proximity to the LOD.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-2079	<p>The LOD is located on the northern side of I-495, east of New Hampshire Avenue, in Silver Spring, Maryland. Commercial development that took place in the 1970s and 1980s is located north of the LOD, with single-family residential developed by the early 1960s to the west and east, and multi-family residential developed in the late 1960s to the south. Ten sites listed on one or more environmental database were identified in the surrounding area. Of these, six had documented releases, however, five of the sites are downgradient/crossgradient of the LOD, or at a sufficient distance where impacts to the LOD are unlikely. The Coca-Cola Bottling site, located 230 feet upgradient from the LOD, was identified as a potential concern. Based on information provided by MDE through a PID request the site was listed as having four USTs ranging in size from 4,000-gallons to 8,000-gallons removed prior to 1996. One OCP case identified petroleum impacted soil isolated to the area immediately around two 4,000-gallon USTs removed in 1993, approximately 650 feet north of the LOD. Based on the distance of the impacted area, impacts to the LOD are unlikely.</p>
WAS-2501	<p>The LOD is located along the central median of Sandy Spring Road (MD 198), east of Columbia Pike (US Route 29), in Burtonsville, Maryland. The surrounding area is primarily commercial. The surrounding area was primarily developed with agricultural and residential properties up until the 1980s, when a plant nursery was observed to the north of the LOD. Commercial development in the surrounding area continued through the 2010s. In approximately 2004, a bypass associated with Columbia Pike, as well as an interchange with Sandy Spring Road was constructed through the western portion of the plant nursery to the north of the LOD. The construction of commercial structure was completed on the property directly south of the LOD in 2018. The plant nursery to the north was flagged for having a 10,000-gallon diesel fuel UST and a 2,000-gallon gasoline UST that were excavated and removed in 1994, approximately the same time as when the new portion of Columbia Pike was built through the western half of the property. These former USTs were located at least 550 feet northwest (crossgradient) of the LOD, under what is now the southbound portion of Columbia Pike. Available records did not state whether a release occurred; however, if impacts were present, they would likely have been addressed during the construction of Columbia Pike. Thus impacts, to the LOD are unlikely. Two additional properties were flagged for having USTs. The commercial property located 300 feet to the south had a 550-gallon gasoline UST, and a church located 270 feet to the northeast had a 1,000-gallon heating oil UST. The OCP cases associated with the removal of these USTs have both received closure. Based on the OCP case status, distance and hydraulic direction, impacts to the LOD from these UST sites are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2502	<p>The LOD is located along the south side of Sandy Spring Road (MD 198), east of the interchange with Columbia Pike (US Route 29) in Burtonsville, Maryland. The surrounding area is mixed used residential/commercial. A storage unit facility is located directly south of the LOD, a commercial building to the west, and a plant nursery, church, and residential properties to the north/northwest. The surrounding area was primarily developed with agricultural and residential properties up until the 1980s, when the plant nursery was observed to the northwest of the LOD. Commercial development in the surrounding area continued through the 2010s. In approximately 2004, a bypass associated with Columbia Pike, as well as an interchange with Sandy Spring Road, were constructed through the western portion of the plant nursery to the northwest of the LOD. The commercial structure directly south of the LOD occurred in 2018. Four facilities of concern were identified. The closest was the church, located approximately 160 feet to the north, had a leaking 1,000-gallon heating oil UST removed in 2008. Available records state that remediation/source removal occurred and the case was closed approximately 6 months later on 5/6/2008. A commercial property located 280 feet from the LOD had a 550-gallon UST excavated in 1988. The records did not state whether a release occurred; however, the property later underwent significant redevelopment. Impacts, if present, likely would have been addressed at that time. The remaining two facilities, both listed in the UST and OCP databases, are located 695 feet and 800 feet away, respectively. Based on the case statuses, distances and hydraulic direction, impacts to the LOD from the facilities are unlikely.</p>
WAS-2503	<p>The LOD is located along the western side of the Columbia Pike (US Route 29), north of Blackburn Road, in Burtonsville, Maryland. The surrounding area is primarily residential, with the exception of an office park to the northeast. Residential development began in the later 1950s and continued through the 1980s. The office park to the northeast was observed to be present by 1989. An autobody shop was listed approximately 660 feet to the north of the LOD; however, further evaluation determined this facility is actually 1,600 feet to the northwest. Thus, impacts to the LOD are unlikely.</p>
WAS-2504	<p>The LOD is located along the eastern side of Columbia Pike (US Route 29), south of Greencastle Road and north of Briggs Chaney Road, in Burtonsville, Maryland. The surrounding area has been primarily residential since the early 1960s. Prior that, the LOD and surrounding area was observed to be agricultural lands. A high school was constructed to the southwest in the late 1960s, and Columbia pike was expanded from a two-lane highway to a four-lane highway in the late 1980s. The LOD and surrounding area were observed to be developed in their current configuration by 1989. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2505	<p>The LOD is located along the east side of New Hampshire Avenue (MD 650), northeast Rodney Road, in Silver Spring, Maryland. The surrounding area is residential properties to the west and a recreation area east of the LOD. No substantial changes to the surrounding area were noted since 1964, with the exception of additional residential development to the southwest. A fire station is located 190 feet (crossgradient) of the LOD. A 550-gallon waste oil UST, a 550-gallon diesel UST, 2000-gallon diesel UST, and 550-gallon gasoline UST were excavated and removed from the site in 1994. No impacted soil was identified in the excavations or removed soil. Additionally, a 2,000-diesel UST was excavated and removed from the site along with four 55-gallon drums of impacted soil. Confirmation samples were collected and analyzed for petroleum constituents, all of which were non-detect and the case was closed shortly thereafter. Based on a review of historical and current imagery, the USTs are believed to be approximately 275 feet northeast (crossgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-2506	<p>The LOD is located along the eastern side of New Hampshire Avenue (MD 650), southeast of Rodney Road, in Silver Spring Maryland. The surrounding area is primarily residential with a recreational area east of the LOD. No substantial changes to the surrounding area were noted since 1964, with the exception of additional residential developments to the southwest. A fire station, located 190 feet (crossgradient) of the LOD, had a 550-gallon waste oil UST, a 550-gallon diesel UST, a 2,000-gallon diesel UST and 550-gallon gasoline UST excavated and removed from the site in 1994. No impacted soil was identified in the excavations or removed soil. Additionally, a 2,000-diesel UST was excavated and removed from the site along with four 55-gallon drums of impacted soil. Confirmation samples were collected and analyzed for petroleum constituents, all of which were non-detect and the case was closed shortly thereafter. Based on a review of historical and current imagery, the USTs were approximately 530 feet northeast (crossgradient) of the LOD. A medical facility/nursing home, located approximately 200 feet southeast (crossgradient) of the LOD, had a 6,000-gallon heating oil UST excavated and removed in 1995. No impacted soil or groundwater was identified based on a review of analytical data. Thus, impacts to the LOD are unlikely.</p>
WAS-2507	<p>The LOD is located in the ROW along Powder Mill Road (MD 212), bordering High Point High School's Track and Field area in Beltsville, Maryland. The surrounding area is a mix of commercial and residential developments, which took place during the 1960s through 1980s time period. The surrounding area is observed in its current configuration by 1994. Four facilities were flagged for being on one or more regulatory database. The closest was an ERNS case involving a 5-gallon release of heating oil from a leaking AST. The release was stopped and the AST replaced. Due to the minor volume released, impacts to the LOD are unlikely. The Shell gas station, located 313 feet to the southwest, has a history of contamination. Three active USTs and five additional former USTs are associated with this site. In addition, five OCP cases, include one for groundwater impacts, have been assigned. All OCP cases are currently closed. While impacts have been documented, the gas station is hydraulically crossgradient of the LOD at a distance of 313 feet. The remaining two flagged facilities are listed under the UST and OCP databases; however, these facilities are location at 540 feet and 600 feet from the LOD, in a hydraulically crossgradient direction. Thus, impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-2508	<p>The LOD is located along the eastern side of Powder Mill Road (MD 212), bordering the High Point High School property, in Beltsville, Maryland. The surrounding area is a mix of commercial and residential developments which took place during the 1960s through 1980s time period. The surrounding area is observed in its current configuration by 1994. Four facilities were flagged for being on one or more regulatory database. The closest facility, an ERNS case located 205 feet from the LOD, involved a 5-gallon release of heating oil from a leaking AST. The leak was stopped and the AST replaced. Due to the minor volume released, impacts to the LOD are unlikely. The adjacent High Point High School was listed on the UST, OCP and RCRA Generator databases. Two active USTs exist for heating oil storage, a 275-gallon UST and an 8,000-gallon UST. In 2008, a 20,000-gallon heating oil UST was removed and replaced with the existing 8,000-gallon UST. During removal, impacted soils were identified near an elbow for the product line, resulting in the excavation of approximately 84.1 tons of impacted soils. Soil endpoint analytical results were all non-detect, indicating the impacts were successfully removed. The location of the former UST is approximately 945 feet from the LOD. The third facility, the apartment complex to the northwest was also listed on the UST and OCP databases for the removal of a 20,000-gallon heating oil UST. A release and cleanup was noted, and the OCP case was closed two years later. The location of this former UST is approximately 500 feet from the LOD. Finally, a gasoline/diesel service station located 600 feet from the LOD, was listed on the UST and OCP databases and has a history of impacts. Based on the distances of these records from the LOD, impacts to the LOD are unlikely.</p>
WAS-2509	<p>The LOD is located along the eastern side of Powder Mill Road (MD 212), bordering the High Point High School property, in Beltsville, Maryland. The surrounding area is a mix of commercial and residential developments which took place during the 1960s through 1980s time period. The surrounding area is observed in its current configuration by 1994. Three facilities were flagged for being on one or more regulatory database. The closest facility, an ERNS case located 265 feet from the LOD, involved a 5-gallon release of heating oil from a leaking AST. The leak was stopped and the AST replaced. Due to the minor volume released, impacts to the LOD are unlikely. The adjacent High Point High School was listed on the UST, OCP and RCRA Generator databases. Two active USTs exist for heating oil storage, a 275-gallon UST and an 8,000-gallon UST. In 2008, a 20,000-gallon heating oil UST was removed and replaced with the existing 8,000-gallon UST. During removal, impacted soils were identified near an elbow for the product line, resulting in the excavation of approximately 84.1 tons of impacted soils. Soil endpoint analytical results were all non-detect, indicating the impacts were successfully removed. The location of the former UST is approximately 850 feet from the LOD. The third facility, the apartment complex to the northwest was also listed on the UST and OCP databases for the removal of a 20,000-gallon heating oil UST. A release and cleanup was noted, and the OCP case was closed two years later. The location of this former UST is approximately 510 feet from the LOD. Based on the distances of these records from the LOD, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2510	<p>The LOD is located along the eastern side of Powder Mill Road (MD 212), bordering the High Point High School property, in Beltsville, Maryland. The surrounding area is a mix of commercial and residential developments which took place during the 1960s through 1980s time period. The surrounding area is observed in its current configuration by 1994. Three facilities were flagged for being on one or more regulatory database. The first facility, the adjacent High Point High School, was listed on the UST, OCP and RCRA Generator databases. Two active USTs exist for heating oil storage, a 275-gallon UST and an 8,000-gallon UST. In 2008, a 20,000-gallon heating oil UST was removed and replaced with the existing 8,000-gallon UST. During removal, impacted soils were identified near an elbow for the product line, resulting in the excavation of approximately 84.1 tons of impacted soils. Soil endpoint analytical results were all non-detect, indicating the impacts were successfully removed. The location of the former UST is approximately 340 feet from the LOD. The second facility, the apartment complex to the northwest was also listed on the UST and OCP databases for the removal of a 20,000-gallon heating oil UST. A release and cleanup was noted, and the OCP case was closed two years later. The location of this former UST is approximately 715 feet from the LOD. The third facility, a residential property listed on the ERNS and OCP databases, is listed at 638 feet upgradient of the LOD. The ERNS case, occurring in 1993, is associated with a report of oil accumulating in a low-lying area of their backyard, and the OCP case, occurring in 2003, was for unspecified incident that involved a release and cleanup. Based on the distances of these records from the LOD, impacts to the LOD are unlikely.</p>
WAS-2511	<p>The LOD is located along the western side of Powder Mill Road (MD 212), north of Glen Shell Road, in Beltsville, Maryland. The northern part of the LOD extends east, across Powder Mill Road. The surrounding area is a mix of commercial and residential developments, which primarily occurred during the 1960s through 1980s time period. The surrounding area is observed in its current configuration by 1994. Two facilities of concern were flagged for being on one or more regulatory database. The High Point High School was listed on the UST, OCP and RCRA Generator databases. Two active USTs exist for heating oil storage, a 275-gallon UST and an 8,000-gallon UST. In 2008, a 20,000-gallon heating oil UST was removed and replaced with the existing 8,000-gallon UST. During removal, impacted soils were identified near an elbow for the product line, resulting in the excavation of approximately 84.1 tons of impacted soils. Soil endpoint analytical results were all non-detect, indicating the impacts were successfully removed. The location of the former UST is approximately 345 feet downgradient from the LOD. The second facility of concern, a residential property listed on the ERNS and OCP databases, is listed at 479 feet upgradient of the LOD. The ERNS case, occurring in 1993, is associated with a report of oil accumulating in a low-lying area of their backyard, and the OCP case, occurring in 2003, was for unspecified incident that involved a release and cleanup. Based on the distances of these records from the LOD, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2512	<p>The LOD is located along the northern side of Powder Mill Road (MD 212), west of Allview Drive, in Beltsville Maryland. A portion of the LOD extends across Powder Mill Road. The area surrounding the LOD is primarily residential properties with Powder Mill High School to the southwest. The area to the north of the LOD was forested land until residential development began in the 1970s. The area surrounding the LOD has been observed in its current configuration since 2005. Two facilities were flagged for OCP cases; however, these facilities are located at 579 feet northeast and 641 feet west of the LOD. Based on these distances, impacts to the LOD are unlikely.</p>
WAS-2513	<p>The LOD lies along the southern side of Powder Mill Road (MD 212), northeast of Allview Drive and Evans Trail, in Beltsville, Maryland. The area surrounding the LOD is primarily residential properties with forested land to the north and east. The area was entirely forest land until the 1980s when residential development began to the south and west. The area was observed in its current configuration since 2005. A SHWS, the Evans Trail Dump Site, is located 430 feet to the south. In 1984, a housing developer discovered approximately 250 drums were discovered between three and eight feet below the ground surface. Samples were collected, which revealed high concentrations of lead in the soil around the drums. The drums and 192 tons of contaminated soil were excavated and disposed of as hazardous waste, plus an additional 350 cubic yards of soil excavated and disposed of as non-hazardous waste. The site was given NFRAP designation by the EPA in 1987. Based on the completed remediation, and subsequent development of a residential housing, impacts to the LOD from the former drums are unlikely. Two other facilities listed on the OCP database were identified; however, as these facilities are located at distances of 520 feet and 579 feet from the LOD, impacts to the LOD are unlikely.</p>
WAS-2514	<p>The LOD is located within the northwest interchange of the I-95 and Maryland State Route 200 in Beltsville, Maryland. The surrounding area is primarily vacant forested land and roadway infrastructure. The surrounding area was primarily a gravel mine up until the late 1960s/early 1970s when I-95 was constructed. Maryland State Route 200 and the interchange were constructed in approximately 2009 and completed by 2013. In 2015, a release of approximately 840-gallons of diesel was release when a tank truck rolled over approximately 360 feet south (downgradient) of the LOD. The material was contained and impacted material was clean-up. As this release occurred on an impervious surface, was located downgradient of the LOD, and was reported to be cleaned up, impacts to the LOD from this release incident are unlikely.</p>
WAS-2515	<p>The LOD is located at the eastern side of I-95, north of the interchange with Maryland State Route 200 and south of the interchange with Konterra Drive. The surrounding area was primarily forested land and gravel mining pits up until the late 1960s/early 1970s when I-95 was constructed. Maryland State Route 200 and the interchange were constructed in approximately 2009 and completed by 2015. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2518	<p>The LOD is located along the southern side of I-95, south of the Old Gunpowder Road overpass, in Beltsville, Maryland. The surrounding area is composed of forested land, residential properties, and agricultural fields. The surrounding area was observed to be primarily forested and agricultural up until the late 1960s/early 1970s, when I-95 was constructed. Additional residential development to the north and east continued up until the late 1980s, when the surrounding area was observed in its current configuration. One record of concern was identified, a 15-gallon release of heating oil from a supply truck, approximately 350 feet from the LOD. The release was cleaned up and the case closed. Impacts to the LOD from this incident are unlikely.</p>
WAS-2519	<p>The LOD is located along the northern side of I-95, west of the Old Gunpowder Road overpass, in Beltsville, Maryland. The surrounding area is composed of forested land, residential properties, and agricultural fields. The surrounding area was observed to be primarily forested and agricultural up until the late 1960s/early 1970s, when I-95 was constructed. Additional residential development to the north and east continued up until the late 1980s, when the surrounding area was observed in its current configuration. One record of concern was identified, a 15-gallon release of heating oil from a supply truck, approximately 550 feet from the LOD. The release was reportedly cleaned up. Based on the amount of material released and distance from the LOD, impacts to the LOD are unlikely.</p>
WAS-2520	<p>The LOD is located along the central median of I-95, immediately west of the Old Gunpowder Road overpass, in Beltsville, Maryland. The surrounding area is composed of forested land, residential properties, and agricultural fields. The surrounding area was observed to be primarily forested and agricultural up until the late 1960s/early 1970s, when I-95 was constructed. Additional residential development to the north and east continued up until the late 1980s, when the surrounding area was observed in its current configuration. One record of concern was identified, a 15-gallon release of heating oil from a supply truck, approximately 425 feet from the LOD. The release was reportedly cleaned up. Based on the amount of material released and distance from the LOD, impacts to the LOD are unlikely.</p>
WAS-2522	<p>The LOD is located along the central median of Columbia Pike (US Route 29), north of Fairland Road and south of the Maryland State Route 200 overpass, in Silver Spring, Maryland. Commercial properties are located to the west and south and multi-family residential buildings are to the east. The area was primarily agricultural and residential properties up until the 1970s, when commercial development was observed to have begun. Construction of MD-200 began around 2009 and was completed around 2013. By 2013, the surrounding area was developed in its current configuration. One record of concern, an OCP case, was listed as being approximately 381 feet south of the LOD; however, after further evaluation, this incident was determined to be approximately 1,060 feet northeast (crossgradient) of the LOD; therefore, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2525	<p>The LOD is located between Columbia Pike (US Route 29) and the exit ramp to Sandy Spring Road, in Burtonsville, Maryland. The surrounding area is developed primarily with commercial properties. The surrounding area was primarily developed with residential and agricultural properties up until the 1980s, when commercial development began to occur. By 2005, the surrounding area was developed in its current configuration. Three records of concern, properties located 400 feet, 550 feet and 650 feet, respectively from the LOD, had former USTs present. The nearest property had an OCP case opened due to impacted soils being encountered during USTs removal activities; however, the OCP was closed within 3 months. Based on the distance and anticipated hydraulic direction (crossgradient), impacts to the LOD from these properties are unlikely.</p>
WAS-2526	<p>The LOD lies along the southern side of Powder Mill Road (MD 212), west of Beltsville Drive, in Beltsville, Maryland. The surrounding area is primarily commercial land to the east and forested land to the west and has been in its current configuration since 2005. Three sites listed as having OCP cases, former USTs or are closed State Hazardous Waste Site were identified between 460 and 745 feet downgradient or hydraulically separated from the site by a stream and are not considered a concern. A fire station located approximately 85 feet southeast (crossgradient) of the LOD had former USTs and documented releases. A PIA request was submitted to MDE for further information; however, the files only documented the removal activities and did contain any analytical sampling data needed to determine whether impacts were present in soil and/or groundwater onsite. However, the USTs are believed to be greater than 100 feet crossgradient of the LOD and any groundwater impacts would flow to the southwest, towards a stream running northwest to southeast. Thus, impacts to the LOD are unlikely.</p>
WAS-2527	<p>The LOD lies along the southern side of Powder Mill Road (MD 212), west of Beltsville Drive, in Beltsville, Maryland. The surrounding area is primarily commercial land to the east and forested land to the west and has been in its current configuration since 2005. Three sites listed as having OCP cases, former USTs or closed State Hazardous Waste Site were identified between 460 and 745 feet downgradient or hydraulically separated from the site by a stream and are not considered a concern. A fire station located approximately 90 feet south (crossgradient) of the LOD had former USTs and documented releases. A PIA request was submitted to MDE for further information; however, the files only documented the removal activities and did contain any analytical sampling data needed to determine whether impacts were present in soil and/or groundwater onsite. However, the USTs are believed to be greater than 100 feet crossgradient of the LOD and any groundwater impacts would flow to the southwest, towards a stream running northwest to southeast. Thus, impacts to the LOD are unlikely.</p>
WAS-2533	<p>The LOD lies along Powder Mill Road (MD 212), at the interchange between I-95 south and MD 212 west, in Beltsville Maryland. The area surrounding the LOD was primarily forest land up until the 1970s when the land was cleared for commercial development and the construction of I-95. The area surrounding the LOD has been observed in its current configuration since 2005. Two sites were identified on the FINDS/FRS, UST, OCP, SPILLS and/or RCRA LQG databases. These sites include SHA Bridge 1620500 located 551 feet to the east, and an Exxon gas station located 624 feet to the southwest. Based on the distances and statuses of these cases, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2534	<p>The LOD is located along the southern side of Sandy Spring Road (MD 198), south of Dino Drive, in Burtonsville, Maryland. The surrounding area is mixed use residential/commercial. The surrounding area was primarily agricultural fields with scattered residential properties until the 1960s when residential development began and continued through the 1980s. In approximately 1989, construction of commercial structures to the west occurred along with the conversion of Sandy Spring Road into a four-lane roadway. Following this development, the surrounding area was observed in its current configuration. Two facilities to the southeast were flagged for being listed on one or more environmental database. A residential dwelling located 420 feet from the LOD, was listed in the OCP database for the closure of a heating oil tank. The OCP case was closed six weeks later. The Silver Spring Moose Lodge located 785 feet from the LOD, was listed on the FINDS/FRS, OCP and UST databases for the removal of a 550-gallon UST and a 1,000-gallon heating oil UST. Impacted soils were encountered and addressed during removal of the 550-gallon UST. Both OCP cases associated with this lodge have been closed. Based on the distances and case statuses, impacts to the LOD from these facilities are unlikely.</p>
WAS-2535	<p>The LOD is located along the northern side of Sandy Spring Road (MD 198), east of Dino Drive in Burtonsville, Maryland. The surrounding area is mixed use residential/commercial. The surrounding area was primarily agricultural fields with scattered residential properties until the 1960s when residential development began and continued through the 1980s. In approximately 1989, construction of commercial structures to the west occurred along with the conversion of Sandy Spring Road into a four-lane roadway. Following this development, the surrounding area was observed in its current configuration. Two facilities to the southeast were flagged for being on one or more environmental database. A residential dwelling located 475 feet from the LOD, was listed in the OCP database for the closure of a heating oil tank. The OCP case was closed six weeks later. The Silver Spring Moose Lodge located 730 feet from the LOD, was listed on the FINDS/FRS, OCP and UST databases for the removal of a 550-gallon UST and a 1,000-gallon heating oil UST. Impacted soils were encountered and addressed during removal of the 550-gallon UST. Both OCP cases associated with this lodge have been closed. Based on the distances and case statuses, impacts to the LOD from these facilities are unlikely.</p>
WAS-2536	<p>The LOD is located along the southern side of Sandy Spring Road (MD 198), south of Riding Stable Road, in Burtonsville, Maryland. The surrounding area is primarily residential and forested land. A church is located to the north of the LOD. The surrounding area was primarily forested and agricultural land up until the 1950s when residential development began. Residential development continued up until 2018, when the surrounding area was observed in its current configuration. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2537	<p>The LOD is located along the central median of Sandy Spring Road (MD 198), north of Bond Mill Road, in Burtonsville, Maryland. The surrounding area is primarily residential and forested/vacant land. Residential properties are located to the east of the LOD. The surrounding area was primarily forested and agricultural land up until the 1950s when residential development began east of the LOD. Residential development continued up until approximately 1989 when the surrounding area was observed in its current configuration. A former concrete facility, located approximately 405 feet south of the LOD, is listed on the FINDS/FRS, OCP and UST databases. The facility appears to have been active from the 1960s to 1980s, based on historical imagery. A 4,000-gallon diesel UST and a 2,000-gallon gasoline UST were excavated and removed in 1994. A release was encountered during the removal of the USTs, which was reportedly remediated. The case received closure in 2004. Based on the local topography, the concrete facility is downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-2538	<p>The LOD is located along the central median of Sandy Spring Road (MD 198), north of Bond Mill Road, in Burtonsville, Maryland. The surrounding area is primarily residential and forested/vacant land. Residential properties are located to the east of the LOD. The surrounding area was primarily forested and agricultural land up until the 1950s when residential development began to the east of the LOD. Residential development continued up until approximately 1989 when the surrounding area was observed in its current configuration. A former concrete facility is located approximately 165 feet south (downgradient) of the LOD. The facility appears to have been active from the 1960s to 1980s, based on historical imagery. The site reportedly had one 4,000-gallon diesel and one 2,000-gallon gasoline UST excavated and removed on 4/12/1994. The 2,000-diesel UST was found to be in good condition and there was no sign of release occurring. The 4,000-gallon diesel UST was found to be in poor condition and perforations were observed on the tank, as well as impacted soil and perched groundwater with a sheen were observed in the excavation. The MDE inspector onsite requested that petroleum impacted water and soil in the diesel excavation be removed from the site and TCLP sample be collected to determine how to properly dispose of the material. Based on the results, only levels of petroleum constituents were detected in the material. However, there is no record that confirmation samples were collected from the excavations. The case was received closure from MDE approximately 3 months later. Based on historical imagery, the USTs were most likely located approximately 530 feet crossgradient of the LOD. Based on distance and hydraulic direction, impacts to the LOD are unlikely.</p>
WAS-2540	<p>The LOD is located along the central median of Columbia Pike (US Route 29), south of Blackburn Road, in Burtonsville, Maryland. Residential properties are located to the north, south, east, and west. The surrounding area was primarily developed with residential and agricultural properties up until the 1960s, when the additional residential development began to occur. By 2005, the surrounding area was observed in its current configuration. One record of concern was identified, an OCP case from 2002, when a vehicle struck a pole-mounted non-PCB containing transformer. This incident, occurring about 255 feet northwest of the LOD, released approximately 9 gallons of mineral oil. The material was cleaned up and the case was closed. Based on the incident description and distance, impacts to the LOD unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2541	<p>The LOD is located along the central median and western side of Columbia Pike (US Route 29), north of Greencastle Road, in Burtonsville, Maryland. Residential properties are located to the north, south, east, and west. The surrounding area was primarily developed with residential and agricultural properties up until the 1960s, when additional residential development began to occur. By 1989, the surrounding area was observed in its current configuration. No records of concern were identified during this environmental review.</p>
WAS-2542	<p>The LOD is located along the central median and eastern side of Columbia Pike (US Route 29), south of Greencastle Road, in Burtonsville, Maryland. A healthcare center is located to the west, while residential properties are located to the north, south, and east. The surrounding area was primarily developed with residential and agricultural properties up until the 1960s, when additional residential development began to occur. By 1989 the surrounding area was observed in its current configuration. No records of concern were identified during this environmental review.</p>
WAS-2543	<p>The LOD is located along the central median and east side of Columbia Pike (US Route 29), north of Briggs Chaney Road, in Burtonsville, Maryland. A public school is located to the west, residential properties to the north and east, and commercial properties to the south. The surrounding area was primarily developed with residential and agricultural properties up until the 1970s, when the additional residential development began to occur. The school to the west was observed in a 1971 aerial photograph. By 1989 the surrounding area was observed in its current configuration. No records of concern were identified during this environmental review.</p>
WAS-2548	<p>The LOD is located along the eastern side of Columbia Pike (US Route 29), north of Musgrove Road and south of Fairland Road, in Silver Spring, Maryland. The surrounding area was primarily agricultural and residential properties up until the 1960s, when commercial and additional residential developed began to increase. The surrounding area was observed in its current configuration by 1989. Two commercial structures currently owned by Verizon are to the east and west of the LOD. The property to the east has had eight USTs registered to the site over the years that ranged in size from 10,000-gallons to 25,000-gallons. Currently two active 25,000-gallon kerosene USTs are located approximately 200 feet east of the LOD. Seven OCP cases, three of which had known releases and cleanups have been opened at the site; however, based on a review of available files provided by MDE, no substantial releases have occurred at the property. As of 2009, the facility was listed as having three 5,000-gallon diesel ASTs, one 50-gallon diesel AST, one 500-gallon used oil AST, and one 600-gallon diesel AST on site. The Verizon property approximately 270 feet to the west had one 1,000-gallon fuel UST excavated and removed from the site in 1997. According to available documents, no release or remediation was reported with the UST closure. A PIA request was submitted to MDE for further information; however, MDE responded stating that file had been destroyed per MDE's file retention policy. Based on historical imagery, the former UST was most likely located on the western side of the facility, at least 460 feet from the LOD. As of 2014, the facility had three 5,000-gallon diesel ASTs and one 660-gallon diesel AST present on site. Based on the information reviewed no substantial environmental concerns were present on either site. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2549	<p>The LOD is located along the central median of Columbia Pike (US Route 29), north of Musgrove Road and south of Fairland Road, in Silver Spring, Maryland. The surrounding area was primarily agricultural and residential properties up until the 1960s, when commercial and additional residential developed began to increase. The surrounding area was observed in its current configuration by 1989. Two commercial structures currently owned by Verizon are to the east and west of the LOD. The property to the east has had eight USTs registered to the site over the years that ranged in size from 10,000-gallons to 25,000-gallons. Currently two active 25,000-gallon kerosene USTs are located approximately 200 feet east of the LOD. Seven OCP cases, three of which had known releases and cleanups have been opened at the site; however, based on a review of available files provided by MDE, no substantial releases have occurred at the property. As of 2009, the facility was listed as having three 5,000-gallon diesel ASTs, one 50-gallon diesel AST, one 500-gallon used oil AST, and one 600-gallon diesel AST on site. The Verizon property approximately 140 feet to the west had one 1,000-gallon fuel UST excavated and removed from the site in 1997. According to available documents, no release or remediation was reported with the UST closure. A PIA request was submitted to MDE for further information; however, MDE responded stating that file had been destroyed per MDE's file retention policy. Based on historical imagery, the former UST was most likely located on the western side of the facility, at least 355 feet from the LOD. As of 2014, the facility had three 5,000-gallon diesel ASTs and one 660-gallon diesel AST present on site. Based on the information reviewed no substantial environmental concerns were present on either site. Thus, impacts to the LOD are unlikely.</p>
WAS-2551	<p>The LOD is located in the central median of Columbia Pike (US Ro29), south of Industrial Parkway in Silver Spring, Maryland. Residential properties and forested land are located to the north and west, townhouses to the south, and commercial properties to the east, along with additional residential properties. The surrounding area was observed to primarily agricultural, with some residential development interspersed throughout up until the 1970s, when additional residential development was observed to the north, along with additional commercial development to the east and south. By 1988 the surrounding area was observed to be developed in its current configuration. One spill case (530 feet south) and one UST case (365 feet north) were identified near the LOD; however, there was no release identified with UST to the north and the 15 gallons that were released associated with the spill case to the south was reportedly addressed. Thus, impacts to the LOD from these incidents are unlikely.</p>
WAS-2553	<p>The LOD is located along the central median of I-95, immediately west of the Old Gunpowder Road overpass, in Beltsville, Maryland. The surrounding area is composed of forested land, residential properties, and agricultural fields. The surrounding area was observed to be primarily forested and agricultural up until the late 1960s/early 1970s, when I-95 was constructed. Additional residential development to the north and east continued up until the late 1980s, when the surrounding area was observed in its current configuration. One record of concern was identified, a 15-gallon release of heating oil from a supply truck, approximately 390 feet from the LOD, which was reportedly cleaned up. Based on the distance, impacts to the LOD from this incident are unlikely.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-2554	<p>The LOD is located along the southern side of I-95, east of the Old Gunpowder Road overpass, in Beltsville, Maryland. The surrounding area is composed of forested land, residential properties, and agricultural fields. The surrounding area was observed to be primarily forested and agricultural up until the late 1960s/early 1970s, when I-95 was constructed. Additional residential development to the north and east continued up until the late 1980s, when the surrounding area was observed in its current configuration. One record of concern was identified, a 15-gallon release of heating oil from a supply truck, approximately 550 feet from the LOD, which was reportedly cleaned up. Based on the distance, impacts to the LOD from this incident are unlikely.</p>
WAS-2556	<p>The LOD is located in a median between southbound I-95 and the exit ramp for Powder Mill Road in Beltsville, Maryland. Residential properties are observed to the west, I-95 to the north and south, and commercial properties to the east, beyond I-95. The surrounding area was primarily agricultural and forested land up until the later 1960s/early 1970s, when I-95 was constructed. The surrounding area was observed in its current configuration by 1988. No records of concern were identified during this environmental review.</p>
WAS-2557	<p>The LOD is located at the southwestern portion of the I-95 and Maryland State Route 200 interchange in Beltsville, Maryland. The surrounding area is primarily vacant forested land and roadway infrastructure. The surrounding area was primarily a gravel mine up until the late 1960s/early 1970s when I-95 was constructed. Maryland State Route 200 and the interchange were constructed in approximately in approximately 2009 and completed by 2013. No records of concern were identified during this environmental review.</p>
WAS-2558	<p>The LOD is located at the eastern side of I-95, north of the interchange with Maryland State Route 200, in Beltsville, Maryland. The surrounding area is primarily vacant forested land and transportation infrastructure. The surrounding area was primarily a forested land and gravel mining pits up until the late 1960s/early 1970s when I-95 was constructed. Maryland State Route 200 and the interchange were constructed in approximately in approximately 2009 and completed by 2013. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2562	<p>The LOD is a ROW located between Columbia Pike (US Route 29) and Old Columbia Pike, east of New Hampshire Avenue, in Silver Springs, Maryland. The surrounding area can be characterized as mixed-use residential/commercial. Multi-family residential structures are observed to the south, along with a commercial shopping center further to the southwest. A police station along with additional multi-family residential structures and single family residential properties are located to the north. Single-family residential properties are also located to the west, beyond the interchange. A police station, mapped at 250 feet to the west, was listed as having two active petroleum ASTs and a former UST. No impacted material was observed during the closure for the former UST. A surficial spill occurred in 2019 during the filling of an existing AST; however, the released material was cleaned up. An apartment complex, located at least 545 feet south, had a 20,000-gallon heating oil UST that was found to have leaked in 1996. Based on available information, the impacted subsurface material was addressed and the site received closure approximately 13 months later. Based on the local topography, the police department and apartment complex facility appear crossgradient and downgradient, respectively, from the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-2564	<p>The LOD is along the northern side of Baltimore Avenue (US Route 1), northeast of Rhode Island Avenue, in Beltsville, Maryland. Commercial structures are present to the north, east and south, while a residential area is to the west. Commercial development began in the 1940s and continued through the 1980s when the surrounding area was observed in its current configuration. An active gasoline station is located 255 feet to the southwest (crossgradient) of the LOD. Ten USTs (5 active, 5 historical) and three closed OCP cases are associated with this gas station. Additional OCP cases were noted 340 feet and 485 feet from the LOD, both in a hydraulically crossgradient direction from the LOD. Finally, ten RCRA generators were mapped as being located between 35 and 510 feet from the LOD; however, none had any documented violations. Based on hydraulic directions and case statuses, impacts to the LOD from these facilities are unlikely.</p>
WAS-2567	<p>The LOD is along the eastern side of Baltimore Avenue (US Route 1), north of Sellman Road, in Beltsville, Maryland. The surrounding area is observed to be developed with commercial and retail businesses with residential areas to the north, which began in the 1940s and continued into the early 2000s when the surrounding area was observed in its current configuration. Fourteen facilities in the surrounding area were listed on one or more of the following databases: DRYCLEANERS, FED DRYCLEANERS, RCRA Generator, OCP, FINDS/FRS, UST, ICIS, SPILLS, ERNS, SWHS, VCP, and LUC. Of these, only one site, the Beltsville Dry Cleaners, is located upgradient of the LOD. This former drycleaner was located directly across Baltimore Avenue, at a distance of approximately 250 feet from the LOD. There are no known reported releases, and the facility no longer exists. Based on this, impacts to the LOD from this former facility is unlikely. The remaining 13 facilities are located either crossgradient or downgradient at distances of 220 feet to 660 feet. Based on the distances and hydraulic direction of these 13 sites, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2568	<p>The LOD is along the western side of Baltimore Avenue (US Route 1), north of Sellman Road in Beltsville, Maryland. The surrounding area is observed to be developed with commercial and retail businesses with residential areas to the north, which began in the 1940s and continued into the early 2000s when the surrounding area was observed in its current configuration. Fourteen facilities in the surrounding area were listed on one or more of the following databases: DRYCLEANERS, FED DRYCLEANERS, RCRA Generator, OCP, FINDS/FRS, UST, ICIS, SPILLS, ERNS, SWHS, VCP, and LUC. Of these, only one site, the Beltsville Dry Cleaners, is located upgradient of the LOD. This former drycleaner was in the building immediately west of the LOD, of which the LOD may be considered part of the property. There are no known reported releases, and the facility no longer exists. Based on this, impacts to the LOD from this former facility is unlikely. The remaining 13 facilities are located either crossgradient or downgradient at distances of 130 feet to 650 feet. Based on the distances and hydraulic direction of these 13 sites, impacts to the LOD are unlikely.</p>
WAS-2569	<p>The LOD is located along the western side of Baltimore Avenue (US route 1), north of Wicomico Avenue, in Beltsville, Maryland. The surrounding area was primarily rural agricultural starting from at least the 1940s through the 1970s when additional residential developments began, followed by significant commercial development during the 1970s. The surrounding area was observed in its current configuration by the early 1980s. Twenty five facilities in the surrounding area were listed on one or more of the following databases: UST, OCP, SPILLS, FINDS/FRS, RCRA Generator, DRYCLEANERS, FED DRYCLEANERS, ICIS and HMIRS. Of these, only two were located either immediately adjacent to the LOD or hydraulically upgradient of the LOD. The adjacent Benkie Nurseries (ERIS Site ID #1) facility previously had a 3,000-gallon gasoline UST removed in 1993, a 6,000-gallon heating oil UST removed in 1996, and a 6,000-gallon heating oil UST removed in 1998. The OCP cases assigned for each UST closure event stated releases had not occurred. A former drycleaner (ERIS Site ID #7/15) was located approximately 470 feet from the LOD. No records of releases or RCRA violations were noted. Based on this, impacts to the LOD from these facilities appear unlikely. The remaining 23 facilities were located either cross- or downgradient from the LOD at distances ranging between 225 and 655 feet from the LOD, and are unlikely to have any impact on the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2572	<p>The LOD is along the western side of Baltimore Avenue (US Route 1), at the intersection of Olympia Avenue, in Beltsville, Maryland. The surrounding area is observed to be forest areas and rural residential in the 1940s. Residential development began and accelerated through the 1970's. Commercial development along Baltimore Avenue occurred in the 1970's and continued through the early 1980's. By the early 1980's the surrounding area was observed to be developed in its current configuration. Seventeen facilities were flagged as being on the SPILLS, HMIRS, ERNS, OCP, UST, RCRA generator, FINDS/FRS, ICIS and/or TRIS databases. The closest incident, a SPILLS case located at 11600 Baltimore Avenue which the LOD appears to be located within, involved the release of antifreeze from a vehicle to the storm sewer. The local fire department was tasked with cleaning. A spill of #2 fuel oil occurred 135 feet from the LOD when an AST was overfilled. A remediation contractor was hired to address the spill impacts. The remaining 15 facilities were all located 300 feet or greater from the LOD. Based on the spill incident volumes, spill response activities or distances from the LOD, none of the 17 flagged facilities are anticipated to have an impact on the LOD.</p>
WAS-2573	<p>The LOD is along the western side of Baltimore Avenue (US Route 1), north of Quimby Avenue, in Beltsville, Maryland. The surrounding area is primarily commercial, with residential properties present to the southwest. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast and residential to the southwest. Additional commercial development to the north and east, and residential development to the southwest, continued through the late 2000s when the surrounding area was observed in its current configuration. A HMIRS case, associated with leaking fire extinguishers, was noted 500 feet from the LOD, and a former RCRA generator was 175 feet from the LOD. Impacts to the LOD from these facilities are unlikely.</p>
WAS-2574	<p>The LOD is along the western side of Baltimore Avenue (US Route 1), north of Quimby Avenue, in Beltsville, Maryland. The surrounding area is primarily commercial, with residential properties present to the southwest. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast and residential to the southwest. Additional commercial development to the north and east, and residential development to the southwest, continued through the late 2000's when the surrounding area was observed in its current configuration. A HMIRS case, associated with leaking fire extinguishers, was noted 420 feet from the LOD, and a former RCRA generator was 365 feet from the LOD. Impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2575	<p>The LOD is along the west side of Baltimore Avenue (US Route 1), south of Ammendale Road, in Beltsville, Maryland. The surrounding area is primarily commercial. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast. Commercial development continued in all directions through the late 2000s when the surrounding area was observed in its current configuration. The commercial property to the west, the Maryland Motor Vehicle Administration which the LOD appears located within, was flagged for an unspecified enforcement activity related to road transportation actions. It is unlikely this enforcement action was related to a release hazardous waste or petroleum to the environment. A HMIRS case, associated with leaking fire extinguishers, was noted 475 feet from the LOD, and RCRA generators were noted 480 feet and 567 feet from the LOD. Impacts to the LOD from these facilities are unlikely.</p>
WAS-2576	<p>The LOD is along the west side of Baltimore Avenue (US Route 1), south of Ammendale Road, in Beltsville, Maryland. The surrounding area is primarily commercial. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast. Commercial development continued in all directions through the late 2000s when the surrounding area was observed in its current configuration. The commercial property to the west, the Maryland Motor Vehicle Administration which the LOD appears located within, was flagged for an unspecified enforcement activity related to road transportation actions. It is unlikely this enforcement action was related to a release hazardous waste or petroleum to the environment. A HMIRS case, associated with leaking fire extinguishers, was noted 550 feet from the LOD, and a RCRA generator 360 feet from the LOD. Impacts to the LOD from these facilities are unlikely.</p>
WAS-2577	<p>The LOD is along the west side of Baltimore Avenue (US Route 1), south of Ammendale Road, in Beltsville, Maryland. The surrounding area is primarily commercial. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast. Commercial development continued in all directions through the late 2000s when the surrounding area was observed in its current configuration. The commercial property to the west, the Maryland Motor Vehicle Administration which the LOD appears located within, was flagged for an unspecified enforcement activity related to road transportation actions. It is unlikely this enforcement action was related to a release hazardous waste or petroleum to the environment. A HMIRS case, associated with leaking fire extinguishers, was noted 600 feet from the LOD, and a RCRA generator 275 feet from the LOD. Impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2578	<p>The LOD is along the west side of Baltimore Avenue (US Route 1), south of Ammendale Road, in Beltsville, Maryland. The surrounding area is primarily commercial. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast. Commercial development continued in all directions through the late 2000s when the surrounding area was observed in its current configuration. The commercial property to the west, the Maryland Motor Vehicle Administration which the LOD appears located within, was flagged for an unspecified enforcement activity related to road transportation actions. It is unlikely this enforcement action was related to a release hazardous waste or petroleum to the environment. A HMIRS case, associated with leaking fire extinguishers, was noted 700 feet from the LOD, and a RCRA generator 240 feet from the LOD. Impacts to the LOD from these facilities are unlikely.</p>
WAS-2579	<p>The LOD is along the west side of Baltimore Avenue (US Route 1), south of Ammendale Road in Beltsville, Maryland. The surrounding area is primarily commercial. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast. Commercial development continued in all directions through the late 2000s when the surrounding area was observed in its current configuration. A HMIRS case, associated with leaking fire extinguishers, was noted 350 feet from the LOD, and two RCRA generators were identified 255 feet and 470 feet from the LOD. Two other facilities had unspecified records or enforcement activities. Impacts to the LOD from these facilities are unlikely.</p>
WAS-2580	<p>The LOD is along the west side of Baltimore Avenue (US Route 1), south of Ammendale Road in Beltsville, Maryland. The surrounding area is primarily commercial. The area was observed to be grasslands and forested areas through the early 1970s when commercial development began to the east-northeast. Commercial development continued in all directions through the late 2000s when the surrounding area was observed in its current configuration. A HMIRS case, associated with leaking fire extinguishers, was noted 495 feet from the LOD, and two RCRA generators were identified 330 feet from the LOD. Two other facilities had unspecified records or enforcement activities. Impacts to the LOD from these facilities are unlikely.</p>
WAS-2581	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), north of Ammendale Road, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the northeast occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. A commercial property located 90 feet south of the LOD was listed on the RCRA VSQG and HMRIS databases. The HMRIS case involved a small release of corrosive acid following dropping of a package by a FedEx employee. The RCRA VSQG listing had no violations noted. Additional RCRA generators were listed at 115 feet and 230 feet to the south. Based on the incident descriptions or distances from the LOD, impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2582	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), north of Ammendale Road, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the northeast occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. A commercial property located 135 feet south of the LOD was listed on the RCRA VSQG and HMRIS databases. The HMRIS case involved a small release of corrosive acid following dropping of a package by a FedEx employee. The RCRA VSQG listing had no violations noted. Additional RCRA generators were listed at 230 feet and 365 feet to the south. Finally, a commercial property listed 565 feet to the north was listed on the OCP and UST databases for the removal of a 10,000-gallon gasoline UST in July 2011. The information stated that no release occurred and no cleanup activities were required. Based on the case statuses or distances from the LOD, impacts to the LOD from these facilities are unlikely.</p>
WAS-2583	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), north of Ammendale Road, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. The commercial property immediately northwest was listed on the OCP and UST databases for the removal of a 10,000-gallon gasoline UST in July 2011. The information stated that no release occurred and no cleanup activities were required. In addition, multiple RCRA generators were identified at distances of 230 feet, 325 feet and 470 feet to the south, and 633 feet to the north. Finally, a HMRIS case involving a small release of corrosive acid following dropping of a package by a FedEx employee occurred 230 feet to the south. Based on the case statuses or distances from the LOD, impacts to the LOD from these facilities are unlikely.</p>
WAS-2584	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), south of Ritz Way in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. The commercial property to the northwest, which the LOD appears to reside in, was listed on the OCP and UST databases for the removal of a 10,000-gallon gasoline UST in July 2011. The information stated that no release occurred and no cleanup activities were required. The adjacent property to the north was listed as a RCRA small quantity generator of spent halogenated solvents. No violations were noted with this generator. Additional RCRA generators were identified as distances of between 445 feet and 585 feet to the south. Finally, a HMRIS case involving a small release of corrosive acid following dropping of a package by a FedEx employee occurred 335 feet to the south. The spill was addressed. Based on the case statuses or distances from the LOD, impacts to the LOD from these facilities is unlikely.</p>

WAS-2585	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), south of Ritz Way, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. The commercial property to the west, which the LOD appears to reside in, was listed on the OCP and UST databases for the removal of a 10,000-gallon gasoline UST in July 2011. The information stated that no release occurred and no cleanup activities were required. The adjacent property to the north was listed as a RCRA small quantity generator of spent halogenated solvents. No violations were noted with this generator. In addition, a HMIRS case and a RCRA VSQG was listed 450 feet to the south and 560 feet to the south, respectively. The HMIRS incident was associated with a small leak of corrosive liquid that spilled out of a dropped package, while the RCRA generator had no violations noted. Based on the case statuses, impacts to the LOD from these facilities is unlikely.</p>
WAS-2586	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), south of Ritz Way, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. The commercial property to the west, which the LOD appears to reside in, was listed on the OCP and UST databases for the removal of a 10,000-gallon gasoline UST in July 2011. The information stated that no release occurred and no cleanup activities were required. The adjacent property to the north was listed as a RCRA small quantity generator of spent halogenated solvents. No violations were noted with this generator. In addition, an OCP case was listed 600 feet to the north and a HMIRS case was listed 560 feet to the south. The OCP case was closed the same day, while the HMIRS incident was associated with a small leak of corrosive liquid that spilled out of a dropped package. Based on the case statuses, impacts to the LOD from these facilities is unlikely.</p>
WAS-2587	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), south of Ritz Way, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2594	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), south of Ritz Way, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. The commercial property to the west, which the LOD resides in, was noted on the UST, OCP, FINDS/FRS and ICIS databases. Two 8,000-gallon gasoline USTs were removed in January 1996. No indications of a release were noted, and the case was closed five weeks after opening. Further evaluation determined the former USTs were associated with a warehouse located approximately 250 feet west (crossgradient) of the LOD. The FINDS/FRS and ICIS records were associated with compliance / enforcement issues. Based on the location and hydraulic direction of the former USTs, impacts to the LOD are unlikely. Three additional OCP cases were noted at distances of 195 feet, 555 feet and 655 feet from the LOD, all of which have been closed, and a RCRA generator of spent halogenated solvents located 470 feet from the LOD. Based on distances and case statuses, impacts to the LOD from these facilities are unlikely.</p>
WAS-2595	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), south of Ritz Way, in Beltsville, Maryland. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1995. The commercial property to the west, which the LOD resides in, was noted on the UST, OCP, FINDS/FRS and ICIS databases. Two 8,000-gallon gasoline USTs were removed in January 1996. No indications a release were noted, and the case was closed five weeks after opening. Further evaluation determined the former USTs were associated with a warehouse located approximately 250 feet west (crossgradient) of the LOD. The FINDS/FRS and ICIS records were associated with compliance / enforcement issues. Based on the location and hydraulic direction of the former USTs, impacts to the LOD are unlikely. Two additional OCP cases were noted at distances of 325 feet and 445 feet from the LOD, both of which have been closed, and a RCRA generator of spent halogenated solvents located 605 feet from the LOD. Based on these distances, impacts to the LOD from these facilities is unlikely.</p>
WAS-2596	<p>The LOD is located on the west side of Baltimore Avenue (US Route 1), north of Ritz Way, in Beltsville, Maryland. The LOD is situated between Baltimore Avenue and the Konterra Business Campus, which was constructed in the early 1990s. Baltimore Avenue was constructed prior to 1937, though the surrounding area remained cleared land. Commercial development to the east occurred during the 1960s and 1970s, and to the west in the 1980s. The surrounding area was observed in its current configuration in 1994. Eight facilities in the surrounding area were flagged as being on one or more databases. An OCP case approximately 235 feet to the east (crossgradient), occurred in 1990. No details were available, but the case was closed 8 days after opening. Two OCP cases were associated with another commercial facility 210 feet to the east (crossgradient), one for the installation of a UST in 1990 and the other for its removal in 1995. No indications of a release was noted. The remaining six facilities were 540 feet or greater from the LOD. Based on the case statuses, hydraulic direction, or distances, impacts to the LOD from these facilities are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2604	<p>The LOD lies along Powder Mill Road (MD 212), southwest of Beltsville Drive, in Beltsville Maryland. The area surrounding the LOD is primarily commercial land to the east and forested land to the west and has been observed in its current configuration since 2005. Three sites listed as having OCP cases, former USTs or are closed State Hazardous Waste Site were identified between 460 and 745 feet downgradient or hydraulically separated from the site by a stream and are not considered a concern. A fire station is located approximately 90 feet south (crossgradient) of the LOD. The site had former USTs and documented releases. A PIA request was submitted to MDE for further information; however, the files only documented the removal activities and did contain any analytical sampling data needed to determine whether impacts were present in soil and/or groundwater onsite. However, the USTs are believed to be at least 100 feet crossgradient of the LOD and any groundwater would flow southwesterly towards a stream running northwest to southeast. Thus, impacts to the LOD are unlikely.</p>
WAS-2608	<p>The LOD lies in a median between the I-95 north-bound lanes and the onramp from the Powder Mill Road (MD 212) interchange, north of the Powder Mill Road overpass in Beltsville Maryland. The area surrounding the LOD was previously forested land until the construction of I-95 in the late 1960s. The area surrounding the LOD has been observed in its current configuration since 2005. The Powder Mill Road overpass, located 530 feet to the south, was listed on the RCRA LQG, SPILLS and OCP databases. The RCRA LQG listing was for lead and is likely associated lead abatement during bridge rehabilitation. The SPILLS and OCP cases all involved releases of petroleum as a result of vehicle accidents. In one case, approximately 2,000-gallons of asphalt was released from a tanker truck. SHA requested guidance from MDE on cleanup. The remaining motor vehicle accidents were all minor releases. Based on the distance between the LOD and the overpass, impacts to the LOD are unlikely.</p>
WAS-2609	<p>The LOD lies in a median between the I-95 north-bound and the onramp from the Powder Mill Road (MD 212) interchange, north of the Powder Mill Road overpass, in Beltsville Maryland. The area surrounding the LOD was previously forested land until the construction of I-95 in the late 1960s. The area surrounding the LOD has been observed in its current configuration since 2005. No records of concern were identified during the environmental review.</p>
WAS-2610	<p>The LOD lies in a median between the I-95 north-bound lanes and the onramp from the Powder Mill Road (MD 212) interchange, north of the Powder Mill Road overpass, in Beltsville Maryland. The southern end of the LOD extends east and west, across the roadways. The area surrounding the LOD was previously forested land until the construction of I-95 in the late 1960s. The area surrounding the LOD has been observed in its current configuration since 2005. No records of concern were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2611	<p>The LOD lies in a median between the I-95 north-bound lanes and the offramp for the Powder Mill Road (MD 212) interchange, immediately south of the Powder Mill Road overpass, in Beltsville Maryland. The area surrounding the LOD was previously forested land until the construction of I-95 in the late 1960s. The area surrounding the LOD has been observed in its current configuration since 2005. The Powder Mill Road overpass was listed on the RCRA LQG, SPILLS and OCP databases. The RCRA LQG listing was for lead and is likely associated lead abatement during bridge rehabilitation. The SPILLS and OCP cases all involved releases of petroleum as a result of vehicle accidents. In one case, approximately 2,000-gallons of asphalt was released from a tanker truck. SHA requested guidance from MDE on cleanup of the asphalt. The remaining motor vehicle accidents were all minor releases. Based on the nature and type of releases, impacts to the LOD are unlikely.</p>
WAS-2612	<p>The LOD lies along the interchange from I-95 south-bound to Powder Mill Road (MD 212) east-bound in Beltsville, Maryland. The area surrounding the LOD was previously forested land until the construction of I-95 in the late 1960s. The area surrounding the LOD has been observed in its current configuration since 2005. Two sites of concern in the surrounding area were identified. The first site, an active gas station located 345 feet west of the LOD, has four active USTs and one former UST. This gas station has a history of environmental issues, including impacted soil and groundwater; however, based on reports provided by MDE, this site is located hydraulically crossgradient of the LOD. The second site of concern, a hotel located 519 feet to the south (downgradient) has one active UST and one former UST. During removal of the former UST, no subsurface impacts were noted. Based on the distance and hydraulic direction of these sites, impacts to the LOD are unlikely.</p>
WAS-2613	<p>The LOD lies along Powder Mill Road (MD 212), southwest of Beltsville Drive, in Beltsville, Maryland. The area surrounding the LOD is primarily commercial to the east and forested land to the west, and has been observed in its current configuration since 2005. Three sites listed as having OCP cases, former USTs or are closed State Hazardous Waste Site were identified between 465 and 825 feet downgradient or hydraulically separated from the site by a stream and are not considered a concern. A fire station is located approximately 90 feet south (crossgradient) of the LOD. The site had former USTs and documented releases. A PIA request was submitted to MDE for further information; however, the files only documented the removal activities and did contain any analytical sampling data needed to determine whether impacts were present in soil and/or groundwater onsite. However, the USTs are believed to be at least 175 feet crossgradient of the LOD and any groundwater would flow southwest, towards a stream running northwest to southeast. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-2614	<p>The LOD is primarily located on the north side of Columbia Pike (US Route 29), between Columbia Pike and Milestone Drive, and east of Stewart Avenue, in Silver Springs, Maryland. Portions of the LOD extend across Columbia Pike and Milestone Drive. The surrounding area can be characterized as mixed-use residential/commercial. Multi-family residential structures are observed to the south, along with a commercial shopping center further to the southwest. A police station along with additional multi-family residential structures and single family residential properties are located to the north. Single-family residential properties are also located to the west, beyond the interchange. The police station, located 360 feet to the west, was listed as having two active petroleum ASTs and a former UST. No impacted material was observed during the closure for the former UST. A surficial spill occurred in 2019 during the filling of the existing AST; however, the released material was cleaned up. The remaining records were associated with facilities located 570 feet and 760 feet from the LOD. Based on the distances of these facilities, impacts to the LOD are unlikely.</p>
WAS-2615	<p>The LOD lies along the I-95 northbound exit ramp for Powder Mill Road (MD 212) westbound, north of the Powder Mill Road overpass, in Beltsville, Maryland. The area surrounding the LOD was previously forested land until the construction of I-95 in the late 1960s. The area surrounding the LOD has been observed in its current configuration since 2005. The Powder Mill Road overpass, located 530 feet to the south, was listed on the RCRA LQG, SPILLS and OCP databases. The RCRA LQG listing was for lead and is likely associated lead abatement during bridge rehabilitation. The SPILLS and OCP cases all involved releases of petroleum as a result of vehicle accidents. In one case, approximately 2,000-gallons of asphalt was released from a tanker truck. SHA requested guidance from MDE on cleanup. The remaining motor vehicle accidents were all minor releases. Based on the distance between the LOD and the overpass, impacts to the LOD are unlikely.</p>
WAS-3301	<p>The LOD is located along the west side of Laytonsville Road (MD 108), between Griffith Road and Brink Road, in Gaithersburg, Maryland. The surrounding area is primarily rural agricultural land with some residential houses to the south of the LOD. The land is observed to be used as agricultural land since prior to 1959. Residential development is observed to begin around to 1993. The surrounding area is observed to be developed in its current configuration around 2009. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-3302	<p>The LOD is located in the ROW along the west side of Laytonsville Road (MD 108), between Griffith Road and Brink Road, in Gaithersburg, Maryland. The surrounding area is primarily rural agricultural land with some residential houses to the south of the LOD. The land is observed to be used as agricultural land since prior to 1959. Residential development is observed to begin around to 1993. The surrounding area is observed to be developed in its current configuration around 2009. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3303	<p>The LOD is located along the west side of Woodfield Road (MD 124), between Exodus Drive and Collins Drive, in Gaithersburg, MD. The surrounding area is primarily forested and residential properties. Residential development is observed to begin around to 1981 and continued through 2005, when the surrounding was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD were observed during the environmental review.</p>
WAS-3306	<p>The LOD is located along the north side of Spencerville Road (MD 198), east of Good Hope Road, in Spencerville, MD. An unpaved road leads north from Spencerville Road on the east side of LOD, the road is blocked to vehicles by large concrete blocks. The area immediately surrounding the LOD is forested, with primarily residential development further out, mostly constructed by 1960 other than an area to the northwest constructed in the 2000's. A Seventh-Day Adventist church is located approximately 415 ft to the southwest of the LOD and is identified in the environmental database search as the Spencerville Junior Academy. One former heating oil UST and one existing 8,000-gallon heating oil UST are registered to property; however, no OCP cases with the site were identified. Impacts to the LOD are unlikely, since the site is believed to be downgradient.</p>
WAS-3307	<p>The LOD is located adjacent to the southeast corner of the intersection of Shady Grove Road and Metro Access Road, in Derwood, Maryland. Based on a review of aerial photographs, the LOD was formerly occupied by an off-ramp of the Metro Access Road constructed in the 1980s, which has since been realigned based on aerial photographs between 2009 and 2011 and is now grass and vegetation-covered land. The surrounding area is residential with some commercial and industrial developments. The residential development is observed to begin between 1959 and 1971. The commercial and industrial developments are observed to begin in 1981 based on aerial photographs. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-3308	<p>The LOD is located along the east side of Olney Laytonsville Road, southeast Brookfield Road, in Olney, Maryland. The surrounding area is semi-rural with some commercial and residential developments. Development of the surrounding area is observed to mostly complete by 1959, with small expansion of a commercial property northwest of the LOD finishing in 2011. The commercial property northwest of the LOD appears to be a garden nursery and has several database listings. The site previously operated four USTs and has had several OCP cases. The site was listed as being 180 feet northwest of the LOD; however, at further review the site and former USTs were at least 775 feet northwest of the LOD. Thus, impacts are unlikely.</p>
WAS-3601	<p>The LOD is located along the west side of Rockville Pike (MD 355), north of Edison Lane, in Rockville, Maryland. The surrounding area is commercial, consisting mostly of office buildings and retail constructed in the 1970's and 1980's. The surrounding area was observed to be developed in its current configuration in the late 1980s. Three sites between 300 feet and 655 feet of the LOD, including a former mall and existing office buildings were identified as having former USTs with documented releases; however, after a review of available information provided by MDE through a PIA request any impacts are believed to be isolated to those properties or downgradient/crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3602	<p>The LOD is located along north side of Bradley Boulevard (MD 191), east of Seven Locks Road, in Bethesda, Maryland. The LOD is located south of the Bethesda Country Club and St George Orthodox Church, east of the intersection of the Bradley Boulevard and Seven Locks Road. The area is considered suburban. The LOD lies along the southern boundary of Bethesda Country Club that is listed as a delisted SHWS due to the potential that irritant gases were tested on a small area of the property around WWI. Regulators determined that no testing was required and no further action was warranted. Several USTs have been removed from the site, approximately 975 feet to the north. Thus, impacts to the LOD are unlikely.</p>
WAS-3603	<p>The LOD is located along the east side of Connecticut Avenue, north of Beach Drive, in Kensington, Maryland. Grace Episcopal Day School is located directly east of the LOD. Residential properties abut the LOD to the west and north. Forest land followed by I-495 is to the south. The school to the east, once had an 8,000-gallon heating oil (diesel #2) UST (installed in 1960), that was excavated and removed from the site in 1999. There was no release or clean-up associated with the excavated UST; therefore, the case received closure approximately 1 month later. Additionally, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-3604	<p>The LOD is located along the east side of Connecticut Avenue, west of Dunnel Lane, in Kensington, Maryland. Residential properties abut the LOD in all directions. Based on historical imagery, residential development began prior to 1959 and continue through approximately 1988, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-3606	<p>The LOD is located along the southern side of Columbia Pike (US Route 29), north of Oak Leaf Drive, in Silver Spring, Maryland. The surrounding area is primarily residential. Single family residences are located to the west and north of the LOD, while townhouses and multi-story residential apartment complexes are located to the south and east. Commercial development is observed further to the east. The surrounding area was primarily undeveloped up until the late 1960s/early 1970s, when residential development began. The surrounding area was observed in its current configuration around 1988. Two of the multi-story residential apartments to the east were listed for having former and existing USTs for the storage of heating oil. There have been no reported releases and/or clean-ups associated with these USTs. Further, the properties are 400 feet to 656 feet crossgradient of the LOD; therefore, impacts to the LOD from these sites are unlikely.</p>
WAS-3607	<p>The LOD is located in the southwest portion of the New Hampshire Avenue (MD 650) and Columbia Pike (US Route 29) interchange in Silver Spring, Maryland. The surrounding area is primarily residential to the north, south, and west. A shopping center is located to the east, and multi-family apartment complexes to the south. The surrounding area was primarily undeveloped up until the late 1960s/early 1970s, when residential development began. The surrounding area was observed in its current configuration around 1988. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3608	<p>The LOD is located to the west of the intersection of River Road (MD 190) and Goldsboro Road, in Bethesda, Maryland. The surrounding area is primarily residential. Residential development is observed to begin prior to 1960 and continued through 1971, when the surrounding area was observed to be developed similar to its current configuration. Sewage spill was reported 345 feet to the east-southeast of the LOD. The site is believed to be downgradient from the LOD and is separated from the LOD by a stream. Thus, impacts to the LOD are unlikely.</p>
WAS-3613	<p>The LOD is located along the south side of Democracy Boulevard, east of Taveshire Way, in Bethesda, Maryland. The surrounding area is a mix of residential and commercial developments. Residential and commercial development began prior to 1959 and continued through 1998, when the surrounding area was observed to be developed in its current configuration. The LOD is to the south across Democracy Boulevard from an indoor shopping center where there have been two closed OCP cases and several former USTs. All of these sites are located at least 500 feet from the LOD and are of low concern. There are also two sites within the shopping center that are RCRA CESQG and RCRA SQG, both with no records of violations. In addition to the shopping center, a gas station is located 515 feet from the LOD with several spills and closed OCP cases. Due to the distance of the gas station and its assumed downgradient location relative to the LOD, impacts to the LOD is unlikely from these sites, as well as the four sites listed in the environmental database report.</p>
WAS-3614	<p>The LOD is located along the south side of Democracy Boulevard, between I-270 and Westlake Drive, in Bethesda, Maryland. The surrounding area is a mix of commercial and residential buildings. Residential and commercial development is observed to begin prior to 1959 and continued through 1998, when the surrounding area was observed to be developed in its current configuration. The LOD is located to the south across Democracy Boulevard from an indoor shopping center where there has been two OCP closed cases and several former USTs on site. Although the addresses of the sites list the stores as 200 feet from the LOD, they both measure approximately 900 feet from the LOD and therefore are of low concern. Two additional sites are listed as RCRA SQG and RCRA CESQG with no known compliance violations. Thus, impacts to the LOD are unlikely.</p>
WAS-3615	<p>The LOD is located along the north side of Norbeck Road (MD 28), west of Muncaster Mill Road (MD 115), in Rockville, Maryland. The LOD has remained vacant land since the 1950s; however, it is possible that a driveway associated with a rural residential dwelling formerly transected a portion of the LOD based on an aerial photograph from 1971. The LOD appeared to be in its current configuration by 1988. The surrounding area is primarily residential with St. Patrick's Catholic Church to the north. The surrounding residential development is observed to begin in the 1950s. Development of the church to the north is observed to begin in 1971. The area is observed to be in its current configuration by 2013. Three sites within a 0.125-mile radius of the LOD were identified with closed OCP cases and removed heating oil USTs; however, all of these are located greater than 400 feet from the LOD and are believed to be hydraulically downgradient/ crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3617	<p>The LOD is located along the east side of River Road (MD 190), immediately north of Brookside Drive, in Chevy Chase, Maryland. The surrounding area is a mix of commercial and residential developments. Commercial and residential development began prior to 1960, and is observed in its current configuration by 1963. Numerous sites listed on one or more environmental database were identified in the surrounding area. The most significant is a large redevelopment project occurring to the south/southwest, which encompasses multiple properties listed on either the DRYCLEANERS, UST, OCP, SHWS, VCP, LRP and/or RCRA Generator databases. Multiple Phase I and Phase II investigations associated with this large redevelopment project included an area covering a retirement center, located approximately 260 feet west of the southern portion of the LOD, along with a professional building to the southwest that includes a dry cleaner, two gas stations, and a large shopping center further to the southwest. The project entered into the MDE VCP program in 2014. Environmental investigations have detected petroleum and chlorinated constituents in soil and groundwater samples above MDE cleanup standards. The impacted areas are located to the south/southwest of the LOD, which is hydraulically crossgradient based on groundwater flow direction. Further, the investigations have determined the soil and groundwater in the vicinity of the Westwood Retirement Center, located directly west of the LOD, have not been impacted. Based on this, impacts to the LOD from these facilities appears unlikely. The remaining facilities, which included four dry cleaners, two gas stations, and illicit spills/releases, are located between 260 feet and 615 feet from the LOD, and are believed to either be hydraulically downgradient of the LOD, or upgradient, but hydraulically disconnected from the LOD by a stream. Thus, impacts to the LOD from these remaining facilities is unlikely.</p>
WAS-3618	<p>The LOD is located along the central of River Road (MD 190), south of Braeburn Parkway, in Bethesda, Maryland. The surrounding area is primarily residential. Residential development is observed to begin prior to 1960 and continued through 1981, when the surrounding area is observed to be developed in its current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-3619	<p>The LOD is located along the west side of Layhill Road, north of Briggs Road, in Silver Spring, Maryland. The LOD is surrounded by residential properties on small tracts of land. A church is located to the southwest. Based on historical aerial and topographic maps, the LOD has never been developed. There was significant development in the surrounding area from agricultural use to residential with some commercial during the 1960s, 1970s, and 1980s. The surrounding area was observed to be developed in its current configuration around 1998. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3621	<p>The LOD is located along the southern side of Columbia Pike (US Route 29), south of Oak Leaf Drive, in Silver Spring, Maryland. The surrounding area is primarily residential, with single family residences to the west and north, while townhouses and multi-story residential apartment complexes are located to the south and east. The surrounding area was primarily undeveloped up until the late 1960s/early 1970s, when residential development began. The surrounding area was observed in its current configuration around 1988. Three properties of concern, all associated with the multi-tenant apartment complexes to the east, were listed in the UST and OCP databases. These properties are located 550 feet or greater, in a hydraulically cross- to downgradient direction from the LOD. Thus, impacts to the LOD from these sites are unlikely.</p>
WAS-3622	<p>The LOD is located east of the intersection of Goldsboro Road (MD 614) and Massachusetts Avenue (MD 396), in Bethesda, Maryland. The surrounding area is primarily residential developments. Development of the surrounding area is observed to begin by 1960. The surrounding area is observed to be in its current configuration by 1994. Two OCP cases have been opened in the vicinity of the LOD. However, both cases have been closed and are located over 300 feet crossgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-3623	<p>The LOD is located at the southeastern end of River Service Road, in Bethesda, Maryland. The surrounding area is observed to be primarily residential. Residential development is observed to begin prior to 1949 and continue through 2005, when the surrounding area was observed to be developed in its current configuration. There is one record of concern in the vicinity of the LOD; however, the site is located 540 feet away and is assumed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-3625	<p>The LOD is located on the west side of the intersection of 16th Street, and Elkhart Street (MD 390), in Silver Spring, MD. Elkhart Street traverses the northwestern portion of the LOD. The remainder of the LOD consists mostly of grass and is surrounded by residential development. The surrounding area has been developed since at least the 1930s. Additional commercial development was observed to the south in the 1960s. By the 1980s, the surrounding area was observed to be developed similar to its current configuration. There were three sites identified within the environmental database search. Based on a review of available information the sites are not believed to have impacted the LOD based on their proximity to the LOD and/ or type of environmental database listing associated with them.</p>
WAS-3626	<p>The LOD is located along the central median of Veirs Mill Road (MD 586) between Coral Sea Drive and Abbott Road, in Rockville, Maryland. The LOD includes portions of the roadway and a small area of the grassy area south of the roadway. The area consists primarily of residential development that occurred in the early 1960's. No records of concern were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3628	<p>The LOD is located along the central median of Connecticut Avenue (MD 185), north of Everton Street, in Silver Spring, Maryland. The LOD is surrounded by residential properties on small tracts of land to the north, south, east, and west. The Thomas Edison School of Technology and Wheaton High School are located to the east. Based on historical aerial and topographic maps, the LOD was developed as Connecticut Avenue by 1959. Little change to the surrounding area has occurred since then based on historical imagery. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-3629	<p>The LOD is located along the central median of Georgia Avenue (MD 97), north of Henderson Avenue, in Silver Spring, Maryland. The LOD is surrounded by commercial properties to the north and east, and by residential properties on small tracts of land to the south and west. Based on historical aerial and topographic maps, the LOD was developed as Georgia Avenue by 1959. Seven environmental database listings were identified in the immediate area of the LOD. The adjacent property to the east received closure of an OCP case for a heating oil tank closure. There was no report of a release or cleanup. A drycleaner is located 525 feet to northeast (cross-gradient) of the LOD; however, there are no documented releases. An OCP case was opened due to dumping at a Pepco site located 475 feet to the southwest (cross-gradient) and was closed within a month. The other listings were not of concern to the LOD. Thus, impacts to the LOD are unlikely based on the available information on the surrounding sites.</p>
WAS-3631	<p>The LOD is located within the central median of Layhill Road (MD 182), between Glenallan Avenue and the entrance to the Glenmont Rail Yard, in Silver Spring, Maryland. The surrounding area includes the Glenmont Rail Yard to the northwest, Saddlebrook Police Headquarters to the east and northeast, a park to the north, and residential properties to the south and west. Based on historical aerial and topographic maps, development started prior to 1944, with the surrounding area observed in its current development in 2005. The Saddlebrook Police Headquarters was listed on the OCP and UST databases, while the Glenmont Rail Yard was listed on the OCP, UST, SPILLS, and FINDS/FRS and RCRA Generator databases. While the properties were mapped as being immediately east/west of the LOD, the operations on these properties are significantly setback off of Layhill Road, and are believed to be at least 350 feet from the LOD. An additional OCP case was listed at 550 feet from the LOD. All OCP cases associated with these facilities have been closed. Based on distances and case statuses for these facilities, impacts to the LOD are unlikely.</p>
WAS-3632	<p>The LOD is located along the central median of Layhill Road (MD 182), between Briggs Road and the entrance to the Glenmont Rail Yard, in Silver Spring, Maryland. The LOD is surrounded by a park to the west, Maryland-National Capital Park Police station to the southeast, and residential properties on small tracts of land to the north, south, and east. The Glenmont Rail Yard is located to the southwest. Based on historical aerial and topographic maps, the LOD was developed as Layhill Road by 1959. Development continued through the 1990s, when the surrounding area was observed to be developed in its current configuration. Two environmental database listing was identified in the immediate area of the LOD, which includes the registered Pilgrim Nurse School, located approximately 315 feet to the northeast and the Glenmont Rail Yard located approximately 635 feet to the southwest. Both sites are believed to be either downgradient or crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3633	<p>The LOD is located along the east side of Layhill Road (MD 182), south of Briggs Road, in Silver Spring, Maryland. The LOD is surrounded by a park and church to the west, and residential properties on small tracts of land to the north, south, and east. The Glenmont Rail Yard is located to the southwest. The Maryland-National Capital Park Police station is located to the southeast. Based on historical aerial and topographic maps, the LOD was developed as Layhill Road by 1944. There was significant development in the surrounding area from agricultural use to residential with some commercial during the 1960s, 1970s, and 1980s. The LOD and surrounding area have been similar to their current configuration since 1988. One environmental database listing was identified in the immediate area of the LOD, which is the registered Pilgrim Nursey School, located approximately 560 feet to the west. The site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-3634	<p>The LOD is located in on the south side of Norbeck Road (MD 28), between Nadine Drive and Bel Pre Road, in Rockville, Maryland. The area consists primarily of single-family residential development, mostly built in the late 1960's. One spill occurred approximately 150 feet to the west (cross-gradient) of the LOD as a result of a motor vehicle accident in 2018. Some of the material entered a storm drain and the remainder was cleaned up with an absorbent. Based on the quantity of the spill (<5 gallons), impacts to the LOD are unlikely.</p>
WAS-3635	<p>The LOD is located within the central median of Norbeck Road (MD 28) between Nadine Drive and Bel Pre Road, in Rockville, Maryland. The area consists primarily of single-family residential development, mostly built in the late 1960's. One spill occurred approximately 340 feet to the southwest (cross-gradient) of the LOD as a result of a motor vehicle accident in 2018. Some of the material entered a storm drain and the remainder was cleaned up with an absorbent. Based on the quantity of the spill (<5 gallons), impacts to the LOD are unlikely.</p>
WAS-3637	<p>The LOD is located along Norbeck Road (MD 28), northeast of Carrolton Road, in Rockville, Maryland. The surrounding area consists primarily of single-family residential development; the Manor Country Club is located to the south. The residential area was developed in the 1970's. A single environmental database record was found for a property located approximately 70 feet southeast (crossgradient) of the LOD, adjacent to the roadway. The ERNS 1987-1989 listing with no information provided. A PIA request was submitted for the site; however, no files were available. The release was most likely surficial in nature based on the environmental database the site is listed in. Additionally, it is believed that the site is crossgradient of the LOD. Thus, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3639	<p>The LOD is located along the central median of Layhill Road (MD 182), between Ballows Way and Norvale Road, in Aspen Hill, Maryland. The surrounding area is observed to be a mixture of commercial and residential properties. Development of the surrounding area is observed to being prior to 1959. Residential and commercial development in the surrounding area continued through 2005, when the surrounding area was observed to be developed in its current configuration. There are several sites with database listings in the vicinity of the LOD, however, most site do not involve releases or are at distance from the LOD where impacts are unlikely. One site located approximately 200 feet west/northwest (crossgradient) of the LOD had a 550-gallon heating oil UST was excavated and removed from the site in 2000. According to available records, several inches of impacted soil below the grade of the UST were observed; however, it is unknown whether the soil was excavated and removed. Impacts to the LOD are unlikely based on the crossgradient proximity of the site relative to the LOD.</p>
WAS-3640	<p>The LOD is located along Layhill Road (MD 182), north of Briggs Road, in Silver Spring, Maryland. The LOD is surrounded by residential properties on small tracts of land. A church is located to the southwest. Based on historical aerial and topographic maps, the LOD was developed as Layhill Road by 1944. There was significant development in the surrounding area from agricultural use to residential with some commercial during the 1960s, 1970s, and 1980s. The LOD and surrounding area were observed to be developed in their current configuration around 1998. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-3641	<p>The LOD is located on the west side of New Hampshire Avenue (MD 650), north of Sherbrook Drive, in Silver Spring, Maryland. It includes the southbound lanes and median of New Hampshire Avenue, as well as a strip of land on the west side of the road. Both median and strip are lined with trees, and there is a sidewalk on the west side of the road. The land on the west side of New Hampshire Avenue is primarily low-density residential development; denser development lies to the east and south. Two schools are located northeast of the LOD. The area was mostly developed in the 1950's and 1960's. The only site identified in the environmental records search is a middle school located over 400 feet from the LOD. It is a RCRA CESQG with no violations and had a heating oil UST removed with no product release. Based on the local topography, the site is believed to be hydraulically crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-3644	<p>The LOD is located along the central median of University Boulevard W (MD 193), east of Madison Street, in Kensington, Maryland. The LOD is surrounded by high-density residential development on small tracts of land. Based on historical aerial and topographic maps, the LOD was developed as University Boulevard W before 1959. Based on the 1959 aerial photograph, the LOD is part of University Boulevard W with residential development in the surrounding areas. The LOD and surrounding area have been similar to their current configuration since observed commercial and additional residential development in the 1964 aerial photograph. Four environmental database listings were identified in the immediate area of the LOD, some of which are duplicate entries. The Waterford Apartment complex located 510 feet northeast (cross-gradient) of the LOD had an OCP case opened for a heating oil UST removal in 1993, which received closure less than a year later in 1994. There was no report of a release or cleanup. Thus, impact to the LOD is unlikely.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-3645	<p>The LOD is located along the central median of University Boulevard W (MD 193), east of St. Paul Street, in Kensington, Maryland. The LOD is surrounded by high-density residential development on small tracts of land. Albert Einstein High School is located to the north. Based on historical aerial and topographic maps, the LOD was developed as University Boulevard W before 1959. Based on the 1959 aerial photograph, the LOD is part of University Boulevard W with residential development in the surrounding areas. The LOD and surrounding area have been similar to their current configuration since observed commercial and additional residential development in the 1964 aerial photograph. Five environmental database listings were identified in the immediate area of the LOD. In 2007, there was a release of 2.5 gallons of hydraulic oil to a storm drain approximately 40 feet southeast (cross-gradient) of the LOD. Cleanup was completed. Based on volume, completion of cleanup action, and gradient, impact to the LOD from this site is unlikely. The Waterford Apartment complex located 210 feet north (cross-gradient) of the LOD had an OCP case opened for a heating oil tank closure in 1993 and received closure less than a year later in 1994. There was no report of a release or cleanup, therefore, impacts to the LOD from this site are unlikely. The remaining listings are either just listed in registries or have closed status. Thus, impacts to the LOD are unlikely.</p>
WAS-3646	<p>The LOD is located along the central median of University Boulevard W (MD 193), south of West Avenue, in Kensington, Maryland. The LOD is surrounded by a church to the north, commercial to the east, high-density residential development to the west, and single-family residential to the south. Albert Einstein High School is located to the northwest. A shopping mall is located to the east. Based on historical aerial and topographic maps, the LOD was developed as University Boulevard before 1959. Based on the 1959 aerial photograph, the LOD is part of University Boulevard W with residential development in the surrounding areas. The LOD and surrounding area have been similar to their current configuration since observed commercial and additional residential development in the 1964 aerial photograph. Four environmental database listings were identified in the immediate area of the LOD. Three sites between 435 and 650 feet crossgradient of the LOD had listings related to USTs and/or petroleum releases that were remediated and closed. The third site was an apartment complex that has a NPDES permit. Based on the proximity of these sites in relation to the LOD, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3647	<p>The LOD is located in the median of Georgia Avenue (MD 97), north of Veirs Mill Road (MD 586), in Wheaton, Maryland. The LOD is surrounded by commercial development to the north and south. The Wheaton bus station and a shopping mall are located to the west. High rise apartments are located to the east. Based on historical aerial and topographic maps, the LOD was developed as Georgia Avenue before 1959. Based on the 1959 aerial photograph the LOD is part of Georgia Avenue with commercial development in the surrounding areas. The LOD and surrounding area has been similar to their current configuration since observed additional commercial and residential development by 2005 aerial photograph. Sixteen sites were identified in environmental database report, in the immediate area of the LOD. Eleven of those sites had reported releases or UST closures between 50 feet to 600 feet, downgradient of the LOD. There is a SHWS site located approximately 600 feet to the south that has received closure with land-use controls imposed on the site; however, this site is believed to be downgradient of the LOD as well. An OCP case approximately 50 feet to the east of the LOD is associated with a former Gas Station that is currently a large apartment complex that was constructed in the past 10 years. Any impacted materials were mostly addressed during the development and construction of the property. Based on the available information regarding these sites, impacts to the LOD are unlikely.</p>
WAS-3648	<p>The LOD is located in the median of Georgia Avenue (MD 97), north of Dayton Street, in Silver Spring, Maryland. The LOD is surrounded by residential properties on small tracts of land as well as a church to the north. Based on historical aerial and topographic maps, the LOD was developed as Georgia Avenue before 1959. Based on the 1959 aerial photograph the LOD is part of Georgia Avenue with commercial development in the surrounding areas. The LOD and surrounding area has been similar to their current configuration since observed additional commercial and residential development by 2005 aerial photograph. Three environmental database listings related to air and NPDES permits were identified within 25 feet to 525 feet of the LOD. Based on the review the available information, there have been no violations associated with these permitted sites. Thus, impacts to the LOD are unlikely.</p>
WAS-3649	<p>The LOD is located along the central median of University Boulevard W (MD 193), between Rocky Mt. Way and Sligo Creek Parkway, in Silver Spring, Maryland. The LOD is surrounded by forest to the north, south, and east and by residential properties on small tracts of land to the west. Based on historical aerial and topographic maps, the LOD was developed as University Boulevard W before 1959. Based on the 1959 aerial photograph, the LOD is part of University Boulevard W with residential development in the surrounding areas. The LOD and surrounding area have been similar to their current configuration since 1981. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3650	<p>The LOD is located in a central median of Colesville Road (US Route 29), north of Crestmoor Drive, in Silver Spring, Maryland. The surrounding area is woodlands and residential developments. The North Branch of the Anacostia River is to the east, and beyond that is a commercial area just west of where Colesville Road becomes Columbia Pike. Residential development occurred during the 1940s and 1950s, while commercial development occurring during the 1970s and 1980s. The area surrounding the LOD has been observed in its current configuration since 2005. Three facilities were listed in the various databases; two for sewage releases, one for illegal dumping of refuse, and a mis-mapped former gas station identified on the UST and OCP databases. Further evaluation determined the former gas station was located 1,330 feet from the LOD. Based on the type of incident or distance from the LOD, impacts to the LOD from these sites are unlikely.</p>
WAS-3655	<p>The LOD is located on the North side of Norbeck Road (MD 28), north of Baltimore Road, in Rockville, Maryland. The LOD consists of a breakdown lane of Norbeck Road, a strip of trees, a sidewalk, and part of a minor street, also called Norbeck Road. The area north of the road consists of residential development, with the Rock Creek Village Center shopping center to the south. Development in the area generally occurred from the 1970's-1980's. A drycleaner and a gas station were identified over 600 feet to the northeast (upgradient) of the LOD. No releases were reported at the drycleaner. A gas station with closed OCP cases is located approximately 635 east of the LOD. The sites are believed to be hydraulically upgradient of the LOD; however, based on their distance from the LOD, impacts are unlikely.</p>
WAS-3656	<p>The LOD is located on the north side of Norbeck Road (MD 28), south of Marlin Street, in Rockville, Maryland. The LOD consists of roadway a median with trees between Norbeck Rd and Norbeck Road Service Road and includes part of both these roads. The site is surrounded by residential development, other than the Rock Creek Village Shopping Center to the southwest. Development primarily occurred in the 1960's. Multiple database listings for the Rock Creek Village Shopping Center that includes the Village Exxon (approximately 320 feet southwest) and Rock Creek Village Cleaners (approximately 840 feet southwest) were identified in the environmental database report. The shopping center entered into the MDE VCP in 2011 after, and is subject to land use controls (restricted commercial or industrial, use of groundwater prohibited), based on previous environmental investigations that took place at the site, between 1997 and 2011, found PCE in soil, groundwater, and soil gas near the dry cleaner and, near the gas station, MTBE in in soil and groundwater and diesel range organics, and petroleum range organics in groundwater. Based on available information, the sites are believed to be downgradient of the LOD. Several other database listings were identified to the west/southwest (downgradient) of the LOD, which are believed to not be a concern as well. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3657	<p>The LOD is located along the central median of Veirs Mill Road (MD 586), between Woodburn Road and Edmonston Drive, in Rockville, Maryland. The surrounding area consists primarily of single-family residential development, along with an elementary school to the north and a park to the south, both with active recreation, including baseball fields. Development occurred in the 1940's and 1950's. Two environmental database records were identified in the vicinity of the LOD, one for a very small spill and the other for a removed UST with no history of a release, both over 300 feet hydraulically crossgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-3658	<p>The LOD is located along the central median of Norbeck Road (MD 28), west of Baltimore Road, in Rockville, Maryland. The area surrounding the LOD is mostly forested land with residential properties to the east. Norbeck Road was first observed in the early 1970s, prior to that the area was entirely forested land. Residential development began to the east in the early 1970s and continued until the early 1980s when the area was observed in its current configuration. A spill of approximately 5 gallons of gasoline was identified 350 feet to the east of the LOD. Based on the size of the spill and distance from the LOD, impacts to the LOD are unlikely.</p>
WAS-3994	<p>The LOD is located along Old Branch Avenue/Henderson Road across from the intersection with Yorkville Road, in Temple Hills, Maryland. The surrounding area is primarily residential to the southwest and the interstate/highway to the northeast. Residential development is observed to have begun prior to 1949, and is in its current configuration by 2005. Two sites with records of concern were identified, one on the RCRA LQG, OCP and SPILLS databases, and the other on the SPILLS database only. However, these sites are located 640 feet and 650 feet from the LOD, respectively. Based on this, impacts to the LOD from these sites are unlikely.</p>
WAS-3995	<p>The LOD is located within the southeastern interchange between Indian Head Highway (MD 210) and Oxon Hill Road in Oxon Hill, Maryland. The surrounding area is the I-495 / I-95 / MD-210 interchange and some commercial developments. Construction of the interchange and commercial developments begin prior to 1981, and is visible in its current configuration by 2009. Two facilities listed on one or more environmental database was identified; however, both facilities are located over 600 feet from the LOD. Based on the distance of these facilities, impacts to the LOD are unlikely.</p>
WAS-3996	<p>The LOD is located along the western side of Branch Avenue (MD 5), north of Coventry Way, in Temple Hills, Maryland. The surrounding area includes commercial developments in all directions, with residential developments beyond. Commercial and residential development is observed to have begun prior to 1949, and is in its current configuration by 2013. Two OCP cases were listed, one 530 feet to the west and the other 530 feet to the south. One case involved a leaking AST while the other was opened due to a vehicular accident. Both cases involved releases and cleanup actions and have since been closed. Based on the incident statuses and distances, impacts to the LOD from these incidents are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-3997	<p>The LOD is located along the offramp from I-495 onto Branch Avenue (MD-5), in Temple Hills, Maryland. The surrounding area is residential properties to the south, the interstate to the north, and the highway to the southeast of the LOD. Residential development and transportation construction are observed to begin in 1949. The surrounding area is observed to be in its current configuration in 2009. There are two SPILLS and an OCP case in the surrounding area. The OCP case, is believed to be 170 feet downgradient/crossgradient of the LOD, and involved a release and cleanup actions due to a transfer accident. The spill was most likely surficial in nature and was closed the same day it was opened; therefore, the incident is unlikely to have affected the LOD. The second spills case involved the release of 200 gallons of no. 2 heating oil into the ground; however, the site is believed to be approximately 345 feet downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-3999	<p>The LOD is located north of the intersection of Manchester Drive and Deer Pond Land in Camp Springs, Maryland. The surrounding area includes forested land to the north, a commercial structure and Branch Avenue (MD 5) to the west, and residential structures to the east and south. Development of the immediate surrounding area occurred in the 1950s, and is observed in its current configuration by 2005. A church located 70 feet southwest of the LOD previously had a 550-gallon heating oil UST removed in 1994. Information obtained from MDE stated a release had not occurred. Following removal of the 550-gallon UST, a new 280-gallon heating oil UST was installed in its place. The 280-gallon UST is comprised of a composite of steel and fiberglass-reinforced plastic and contains overfill protection. Following installation of the 280-gallon UST, the tank system passed a tightness test. Review of aerial photographs identifies this UST at approximately 190 feet from the LOD. Based on this information, impacts to the LOD from the church's former and existing USTs are unlikely. A residence located 605 feet to the east was also listed on the OCP database for the closure of a heating oil tank. A release and cleanup were noted; however, based on the distance from the LOD, impacts to the LOD are unlikely.</p>
WAS-4000	<p>The LOD is located along the eastern side of Indian Head Highway (MD 210), south of Oxon Hill Road, in Oxon Hill, Maryland. The surrounding area is primarily transportation infrastructure and commercial developments. Commercial development began in 1981, and is observed in its current configuration by 2018. No records of concern in the vicinity of the LOD were observed during the environmental review.</p>
WAS-4006	<p>The LOD is located along the north side of Old Clarksburg Road, between Cabin Branch Avenue and Dunlin Street in, Boyds, Maryland. The surrounding area is semi-rural with some residential developments. Residential development is observed to begin in 2013. The surrounding area is in its current configuration in 2018. A spill occurred at a residence, 445 feet from the LOD, where 200 gallons of residential heating oil leaked into the soil floor of the basement. The release was most likely contained to the interior of the structure. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4010	<p>The LOD is located along north side of Frederick Road (MD 355), south of Greenridge Drive, in Clarksburg, Maryland. The surrounding area is primarily residential with some commercial developments. Residential and commercial development is observed to begin prior to 1981. The surrounding area is observed in its current configuration by 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4011	<p>The LOD is located along the east side of Ridge Road (MD 27), west of Little Seneca Parkway, in Germantown, Maryland. The surrounding area is semi-rural with some residential and commercial developments. Residential and commercial development is observed to begin prior to 1959 and continued through 2015, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4013	<p>The LOD is located at the southeast corner of the intersection of Davis Mill Road and Ridge Road (MD 27), in Germantown, Maryland. The surrounding area is rural with some residential and commercial developments. A gas station is located 435 feet north of the LOD, and previously contained two ASTs and seven USTs on site. Currently, there are two USTs (12,000-gallon and 16,500-gallon gasohol/diesel tanks) in use at the site. In 2002, an OCP case was opened at the gas station due to well/ groundwater contaminated from motor/lube oil that was closed in 2016. Based on local topography, the site is believed to be hydraulically down/crossgradient from the LOD. Thus, impacts are unlikely.</p>
WAS-4014	<p>The LOD is located along the east side Ridge Road (MD 27) to the south Hoffman Drive, in Germantown, Maryland. The surrounding area is semi-rural with some residential and commercial developments. Residential and commercial development is observed to begin prior to 1981. The surrounding area is in its current configuration by 2007. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4015	<p>The LOD is located along the east side of Ridge Road (MD 27) and Ridge Landing Place, in Damascus, Maryland. The surrounding area is forested with some residential developments. Residential development is observed to begin prior to 1993. The surrounding area is observed to be in its current configuration by 2005. In 2019, a SPILLS case was opened 330 feet southeast (i.e., downgradient) of the LOD. The incident involved the release of an unknown quantity of refrigerant gas into the air. Based on the nature of the release, gradient, and distance from the LOD. A church, located 560 feet southwest from the LOD, previously had a UST onsite, which has since been removed from the ground. An OCP case was opened in 2002 during the tank closure as a result of a release. Cleanup was performed and the case received closure within two years. Based on local topography, the church is cross-gradient from the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4016	<p>The LOD is located along the east side of Ridge Road (MD 27), southeast of Valley Park Drive, in Damascus, Maryland. The surrounding area is forested with some residential properties. The surrounding area was primarily agricultural land up until the 1990s, when commercial and residential development began to occur. The surrounding area was observed to be developed in its current configuration by 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4017	<p>The LOD is located along the side of Woodfield Road (MD 124), north of Bethesda Church Road, in Damascus, Maryland. The surrounding area is a mix of commercial and residential developments, which began prior to 1959. The surrounding area was observed to be developed in its current configuration by 2005. Two facilities listed on the OCP and UST databases were identified. The first, an auto body shop located 305 feet from the LOD, previously had four USTs. Based on information provided by MDE, a 4,000-gallon heating oil UST and a 20,000-gallon heating oil UST were removed from the site in 1990, a 1,000-gallon used oil UST was removed in 1993, and a 4,000-gallon heating oil UST was removed in 2010. Regulatory documentation revealed that releases had not occurred from any of the heating oil USTs; however, no documentation was available regarding the 1,000-gallon used oil UST. Based on local topography this site is located upgradient from the LOD, but considering that no impacts were identified with the heating oil USTs, and impacts from used oil, if present, typically do not migrate significantly, impacts to the LOD from this facility are unlikely. The second facility, located 590 feet downgradient of the LOD, had five historical USTs with reported releases; however, based on the distance and the inferred hydraulic direction (crossgradient) from the LOD, impacts are unlikely.</p>
WAS-4018	<p>The LOD is located on the West side of Woodfield Road (MD 124), north of Augusta Farm Lane/Essex View Drive, and extending north past Goshen School Road, in Laytonsville, Maryland. The LOD consists of grass, and Goshen School Rd crosses it, leading from Woodfield Rd to the west. The surrounding area is residential, and was developed from the late 1960's to the early 1990's, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4019	<p>The LOD is located along the west side of Woodfield Road (MD 124), between Glendalough Road and Brink Road. The LOD consists primarily of an open field, along with the southbound lane of Woodfield Road along the east side and a driveway at the northern end leading to the Good Earth Christmas Store. The surrounding area is mostly residential, and was developed from the 1970's to the 1980's, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4020	<p>The LOD is located along the west side of Old Hundred Road (MD 109), south Comus Road, in Dickerson, Maryland. The surrounding area is primarily rural agricultural land. No substantial changes to the surrounding area were noted since at least the 1960s. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-4021	<p>The LOD is located along the west side of Old Hundred Road (MD 109), southwest of Comus Road, in Dickerson, Maryland. The surrounding area is primarily rural agricultural land. No substantial changes to the surrounding area were noted since at least the 1960s. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4022	<p>The LOD is located along the west side of Old Hundred Road (MD 109) between Barnesville Road and Comus Road, in Dickerson, Maryland. The surrounding area is a mix of rural agricultural land and forested areas, with the exception of the farm/ residence to the south/ southwest. No substantial changes to the surrounding area were noted since at least the 1960s. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4023	<p>The LOD is located along the west side of Old Hundred Road (MD 109) between Barnesville Road and Comus Road, in Dickerson, Maryland. The surrounding area is a mix of rural agricultural land and forested areas, with the exception of the farm/ residence to the north/ northwest. No substantial changes to the surrounding area were noted since at least the 1960s. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4024	<p>The LOD is located along the east side of Beallsville Road (MD 109) between Hillrise Lane and Barnesville Road, in Barnesville, Maryland. The surrounding area is a mix of rural agricultural land and forested areas. No substantial changes to the surrounding have occurred since at least the 1960s. A spill incident was identified approximately 20 feet west of the LOD in the environmental database report. According to available information, an oil delivery technician was filling a residential AST and spilt approximately 0.125-gallons of oil in the basement of the residence. The spill was cleaned with a spill pad. Based on the amount of oil released and that the incident occurred indoors, impacts to the LOD are unlikely.</p>
WAS-4025	<p>The LOD is located off the southwest corner of the intersection of Ridge Road and Davis Mill Road (MD 27), in Germantown, Maryland. The surrounding area is semi-rural with some residential and commercial properties. Residential and commercial development is observed to begin in the surrounding area prior to 1959 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. A gas station is located 430 feet north (downgradient) of the LOD that currently has two active petroleum USTs (12,000-gallon and 16,500-gallon) and seven inactive USTs and two inactive ASTs that have been removed from the site. In 2002, an OCP case was opened due to well/ groundwater contamination. Remediation/cleanup actions were taken and the case was eventually closed. Based on local topography the site is believed to be located downgradient from the LOD. Thus, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4026	<p>The LOD is located along the east side of Beallsville Road (MD 109), south of the intersection of Sellman Road, in Dickerson, Maryland. Forested land and several structures are observed to the west and northwest of the LOD. Rural agricultural land along with several structures are observed to the east and south of the LOD. No substantial changes to the surrounding area are observed since at least the 1950s. One release was reported approximately 135 feet from the LOD involving an approximately 200 pounds of batteries in 2016. Available records state that contractors performed the cleanup. Based on local topography the site is believed to be downgradient/ crossgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4027	<p>The LOD is located east side of N Frederick Road (MD 355), south of the Milestone Manor Lane, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the north, west and south, the Ridge Road Recreational Park to the east and northeast, and forested land to the southeast. Based on historical aerial and topographic maps, the LOD has never been developed, but has been part of agricultural land. Based on the 1959 aerial photograph, N Frederick Road was present and the LOD and surrounding areas were agricultural land. Residential development started in 1993 with the LOD and surrounding areas being similar to their current configuration by 2005. One environmental database listing was identified in the immediate area of the LOD; however, the address is incorrect, and the gas station is actually located 0.3 mile to the south (cross-gradient). Thus, impacts to the LOD are unlikely.</p>
WAS-4029	<p>The LOD is located along the west side of N Fredrick Road (MD 355), north of Ridge Road, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the north and west, commercial development to the south, and the Ridge Road Recreational Park to the east. Based on historical aerial and topographic maps, Frederick Road and Ridge Road have been present since the 1940s. The LOD and surrounding area was primarily developed with agricultural properties up until 1993 when residential development began. Commercial development to the south, began in the late 1990s and continued through approximately 2005, when surrounding area were observed to be developed close to their current configuration. Both sites plotted within the boundary of the LOD were found to be misplotted and are actually located 640 feet and 1.5 mile of the LOD. A gas station is located approximately 640 feet to the south (crossgradient) of the LOD. Currently, there are three active 12,000-gallon gasoline USTS registered to the facility that were installed in 1995. The gas station is a SQG of ignitable waste and benzene; no violations were found. Two OCP cases are associated with the gas station including an OCP case opened on 3/13/1995 and closed 4/18/1997 related to compliance (no releases) and an OCP case opened on 1/4/2007 and closed 2/2/2007 (release and cleanup/ remediation conducted). Based on the crossgradient proximity of the site to the LOD, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4030	<p>The LOD is located on the side of N Fredrick Road (MD 355), west of Ridge Road (MD 27), in Germantown, Maryland. The LOD is surrounded primarily with commercial properties to the east and west. Forested land is observed to the northeast and residential developments to the northwest. Based on the 1959 aerial photograph, Frederick Road was present and the LOD and surrounding areas were developed primarily as agricultural land. Residential development started in 1993, along with the construction of Ridge Road. Commercial development to the south, began in the late 1990s and continued through approximately 2005, when surrounding area were observed to be developed close to their current configuration. A gas station is located approximately 160 feet to the east (upgradient) of the LOD. Currently, there are three active 12,000-gallon gasoline USTS registered to the facility that were installed in 1995. The gas station is a SQG of ignitable waste and benzene; no violations were found. Two OCP cases are associated with the gas station, one opened in 1995 for the installation of the three currently active USTs and another one opened in 2007 for the removal of two 40-gallon hydraulic oil tanks. Based on analytical results soils around the two former tanks were not impacts. Several small releases associated with petroleum are also documented at the site but are believed to not be a concern. Thus, impacts to the LOD from the gas station are unlikely.</p>
WAS-4031	<p>The LOD is located along Central median of Ridge Road (MD 27), east of N Fredrick Road (MD 355), in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the east, commercial development to the south, and west, and the Ridge Road Recreational Park to the north. Based on historical aerial and topographic maps, the LOD was developed as Ridge Road by 2005. Three environmental database listings were identified in the immediate area of the LOD, while one site was misplotted and was found to be over 1.5 mile west of the LOD. The Exxon has closure status, the other release listing is a minor spill of heating oil. A gas station is located approximately 100 feet south (downgradient) of the LOD that currently has two gasoline USTs (15,000 gallon and 10,000 gallon) installed in 2010. The station is listed as a minor air source. A SPILL record was reported on 10/5/2015 for the underground contaminant system. There was no release, but there was an error with the system holding air. Based on a review of information provided through a PIA request, there are known environmental impacts or release to the environmental associated with this gas station. Thus, impacts to the LOD are unlikely.</p>
WAS-4038	<p>The LOD is located along the north side of N. Frederick Road (MD 355), northwest of Wheatfield Drive, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracks of land to the east and west, commercial to the north, and forest to the south. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Based on review of the 1959 aerial, the LOD and surrounding areas were residential with agricultural land. Residential and commercial development was observed on the 1971 aerial. The LOD and surrounding areas are similar to their current configuration by 1993. One environmental database listing was identified in the immediate area of the LOD. Since the gas station is located approximately 600 feet downgradient from the LOD, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4040	<p>The LOD is located along the central median of N. Frederick Road (MD 355), southeast of Wheatfield Drive, in Gaithersburg, Maryland. The LOD is surrounded by forest to the north, east and west, and commercial to the south. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Based on review of the 1959 aerial, the LOD and surrounding areas were residential with agricultural land. Residential and commercial development was observed on the 1971 aerial. The surrounding area is observed to be developed in its current configuration around 1993. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4047	<p>The LOD is located along Clopper Road, west of Longdraft Road (MD 117), in Gaithersburg, Maryland. The LOD is surrounded primarily by residential development on small tracts of land. The St. Rose of Lima Catholic Church is located to the northwest. Based on review of historical aerial and topographic maps, Clopper Road was present by 1937, and the LOD and surrounding area were agricultural and residential in use up until 1963, when residential development began in the surrounding area. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. Four environmental database listings were identified in the immediate area of the LOD. An OCP case was opened in 2003 at the St Rose of Lima Church, approximately 320 feet to the northwest (crossgradient) of the LOD, for a heating tank closure. Impacted material was encountered during the closure of the UST, which was addressed and the case was closed in 2005. An OCP case was also opened in 2014 at the residential property for a UST closure, approximately 520 feet southwest (downgradient), and granted closure within days. The remaining two listings dealt with overfills of residential heating oil USTs and occurred 45 feet and 620 feet away respectively, from the LOD. In each case, the release was limited to 1 gallon of product and was cleaned up. Based on quantity of releases, distance to LOD, inferred hydraulic gradient, and/ or performance of cleanup activities, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4052	<p>The LOD is located on along the east side of Quince Orchard Road (MD 124), south of Clopper Road (MD 117). in Gaithersburg, Maryland. The LOD is surrounded by residential and commercial development to the north, undeveloped land to the east and south, and commercial development to the west. The National Institute of Standards and Technology campus is located to the east/southeast. Based on review of historical aerial and topographic maps the Quince Orchard Road and Clopper Road were present by 1937. The LOD and surrounding area were agricultural and residential in use until commercial and residential development began in 1972 and the LOD and surrounding area are similar to current configuration by 1981. Eight environmental database listings were identified in the immediate area of the LOD. A shopping center to the west is listed as a SHWS due to detected concentrations of VOCs in groundwater in the southwestern portion of the site; however, impacts appear to be isolated to the southwestern portion of the site, south of the LOD. A gas station is located west of the LOD. Several investigations were conducted at the site to determine the extent of the impact area. Based on groundwater elevation gauging, groundwater at the site flow from south to north, towards the eastern portion of the LOD. Between August 2013 and September 2015, injections of magnesium sulfate in to select wells to decrease the concentration of petroleum constituents in the groundwater. Based on data that showed that the magnesium sulfate injections had substantially decreased the concentrations of petroleum constituents in the groundwater, locally. MDE granted closure to the site in July 2017. According to groundwater monitoring data from MW-06, directly west of the LOD and the nearest monitoring well to the LOD, all detected concentrations were below reporting limit. Thus, impacts to the LOD are unlikely.</p>
WAS-4053	<p>The LOD is located on Quince Orchard Road south of North Drive in Gaithersburg, Maryland. The LOD is located in the westernmost travel lane of Quince Orchard Road and adjacent paved parking area. The LOD is surrounded by commercial development. The Montgomery College Drive Education building is located to the west and the National Institute of Standards and Technology campus is located to the east. Based on review of historical aerial and topographic maps the Quince Orchard Road was present by 1944. The LOD and surrounding area were agricultural and residential in use until commercial and residential development began in 1972 and the LOD and surrounding area are similar to current configuration by 1981. Six environmental database listings were identified in the immediate area of the LOD. Two SHWS sites located to the east and west of the LOD were identified in the database report, that include the National Bureau of Standards (east) and DRS Solutions/ Watkins Johnson Co (west). Based on available information provided by MDE both sites were identified as potential NPL sites in the 1980s by US EPA. The sites both went through the preliminary assessment (PA) process, which did not identify an evidence of an existing or potential environmental hazard at the facilities. Both sites received NFRAP determinations from US EPA and were eventually closed out of the MDE LRP database. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4058	<p>The LOD is located along the central median of Quince Orchard Road (MD 124), east of Great Seneca Highway (MD 119), in Gaithersburg, Maryland. The LOD is surrounded by residential development to the north and west, and by commercial development to the south and east. Based on review of historical aerial and topographic maps, the Quince Orchard Road was present in 1937 and the LOD and surrounding area are similar to current configuration by 2005. Two environmental database listings were identified in the immediate area of the LOD. A pharmaceutical facility is a SQG approximately 490 feet from the LOD, where no violations were found. A 0.25-gallon spill from a ruptured vehicular hydraulic hose occurred approximately 135 feet from the LOD and was cleaned up. Based on distance or quantity of spill, impacts to the LOD are unlikely.</p>
WAS-4059	<p>The LOD is located along Quince Orchard Road (MD 124), east of Twin Lakes Drive, in Gaithersburg, Maryland. The LOD is surrounded by residential development to the south and east, and by commercial development to the north and west. Based on a review of historical aerial and topographic maps, Quince Orchard Road was present by 1993 and the LOD and surrounding area are similar to current configuration by 2005. Two listings were identified in the environmental database report, including a RCRA Non Generator and spill case between 540 feet and 600 feet of the LOD. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4060	<p>The LOD is located along Quince Orchard Road (MD 124), west of Great Seneca Highway (MD 119, in Gaithersburg, Maryland. The LOD is surrounding by residential development to the north, south, and west and commercial development to the east. Based on review of historical aerial and topographic maps Quince Orchard Road has been present since at least 1944. Residential and commercial development occurred by 1993. The surrounding area was observed to be developed in its current configuration around 2005. A gas station is located approximately 75 feet south (downgradient) of the LOD. The facility has four active 10,000-gallon gasoline USTs present onsite. There have been no reported releases associated with the USTs. Several surficial releases associated with vehicles have occurred at the facility; however, since the releases are not believed to have impacted subsurface media, impacts to the LOD are unlikely.</p>
WAS-4061	<p>The LOD is located along the north side of Quince Orchard Road (MD 124) and Raven Rock Drive, and west of Longdraft Road, in Gaithersburg, Maryland. The LOD is surrounding by residential development to the south, east, and west and the Quince Orchard Swim and Tennis Club to the north. Ridgeview Middle School is located to the northwest. Based on review of historical aerial and topographic maps Quince Orchard Road has been present since at least 1944. Residential and commercial development occurred by 1981. The pool complex directly north of the LOD had one 1,000-gallon and one 10,000-gallon diesel #2 USTs excavated and removed from the site between 1995 and 1996. The 1,000-gallon UST was initially excavated and removed from the site, after product was found along a stream to the north (downgradient) of the pool complex and LOD. Product was leaking through a cinder block wall that flowed into an interior drain that connected to a stormwater system. Once the UST was excavated, the product in the stream cleared up. No substantial issues were found with the 10,000-gallon diesel #2 UST that was excavated several months later. Based on the local topography, the former USTs and impacted stream are believed to be at least 225 feet downgradient of the LOD. Thus, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4063	<p>The LOD is located along the north side of Great Seneca Highway (MD 119) and Longdraft Road, in Gaithersburg, Maryland. The LOD is surrounded by residential development. Based on review of historical aerial and topographic maps, Great Seneca Highway was an unimproved road in 1937. Residential development in the surrounding area was observed in the 1972 and 1981 aerial photographs. Great Seneca Highway was present in 1993 and the LOD and surrounding area are similar to current configuration by 2005. Three environmental database listings were identified in the immediate area of the LOD, including an OCP case and two petroleum spills of .05-gallons and 5-gallons of product. All three listings are located downgradient from the LOD at a distance from 380 feet to 600 feet. Thus, impacts to the LOD are unlikely.</p>
WAS-4064	<p>The LOD is located along the west side of Great Seneca Highway (MD 119), northwest of Sioux Lane, in Gaithersburg, Maryland. The LOD includes the eastbound lane of Great Seneca Highway, adjacent sidewalk, and landscaped area. The LOD is surrounded by residential development with a power utility corridor to the north. Based on review of historical aerial and topographic maps, residential development in the surrounding area was observed in the 1972 and 1981 aerial photographs. Great Seneca Highway was present by 1993 and the LOD and surrounding area are similar to current configuration by 2005. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4065	<p>The LOD is located along Great Seneca Highway (MD 119), northwest of the intersection with Quince Orchard Road (MD 124), in Gaithersburg, Maryland. The LOD is surrounded by residential development to the north, east, and west and commercial development to the south. Based on review of historical aerial and topographic maps, the LOD and surrounding area were agricultural in use from 1937 through 1981. Great Seneca Highway was present by 1993, with observed residential and commercial growth. The LOD and surrounding area are similar to current configuration by 2005. One FINDS/FRS listing for a permitted restaurant was identified 190 feet upgradient of the LOD. No violations were identified during this review. Thus, impacts to the LOD are unlikely.</p>
WAS-4067	<p>The LOD is located along the east side of Great Seneca Highway (MD 119), south of Quince Orchard Road (MD 124), in Gaithersburg, Maryland. The LOD is surrounded by commercial development. Based on review of historical aerial and topographic maps the Great Seneca Highway and commercial development was observed in the 1993 aerial photograph with the LOD and surrounding area similar to their current configuration by 2005. Four environmental database listings were identified in the immediate area of the LOD. The Lowe's is crossgradient 555 feet to the west, a RCRA LQG is located abutting the LOD to the west, and a gas station is located approximately 660 feet downgradient. A biotechnology facility is located approximately 70 feet northeast of the LOD that currently has fourteen ASTs ranging in size between 50 to 20,000-gallons that hold #2 heating oil, used oil, and lubricating oil. Based on available information provided by MDE through a PIA request, there have been no substantial releases reported with the ASTs onsite. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4068	<p>The LOD is located along the central median of Great Seneca Highway (MD 119) north of Orchard Ridge Drive (MD 124), in Gaithersburg, Maryland. The LOD is surrounded by commercial development. Based on review of historical aerial and topographic maps the Great Seneca Highway and commercial development was observed in the 1993 aerial photograph with the LOD and surrounding area similar to their current configuration by 2005. Three environmental database listings were identified in the immediate area of the LOD. The Lowe's is crossgradient 575 feet to the west, a RCRA LQG is located to the west, and a gas station is located 340 feet crossgradient. A biotechnology facility is located approximately 115 feet northeast of the LOD that currently has fourteen ASTs ranging in size between 50 to 20,000-gallons that hold #2 heating oil, used oil, and lubricating oil. Based on available information provided by MDE through a PIA request, there have been no substantial releases reported with the ASTs onsite. Thus, impacts to the LOD are unlikely.</p>
WAS-4072	<p>The LOD is located on Darnestown Road south of Tschiffely Square Road in Gaithersburg, Maryland. The LOD is in the median of Darnestown Road and adjacent travel lanes. The LOD is surrounded by residential development to the north, east, and south, and a church to the southwest. Inspiration Lake, Lake Nirvana and Lake Placid are located to the east. Based on review of historical aerial and topographic maps, Darnestown Road has been present since 1937. Residential development occurred by 1993. Two environmental database listings were identified in the immediate area of the LOD, which includes a natural gas pipeline incident 230 feet away and an elementary school (590 feet away) which is a RCRA VSQG with no reported violations. Based on the nature of the incident and distance to the LOD, respectively, impacts to the LOD are unlikely.</p>
WAS-4078	<p>The LOD is located along the west side of Germantown Road (MD 118), south of Leaman Farm Road, in Germantown, Maryland. The LOD is surrounded by residential properties. Based on review of historical aerial and topographic maps, Germantown Road has been present since 1944. Development in the surrounding area began after 1993 and is similar to current configuration by 2005. One environmental database listing was identified in the immediate area of the LOD. The Germantown Fire Station is located approximately 510 feet north of the LOD and formerly had a UST which was removed in 2019. The associated OCP case was granted closure in 2020. Based on the local topography, the site is believed to be crossgradient of LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4079	<p>The LOD is located along the east side of Germantown Road (MD 118), south of Leaman Farm Road, in Germantown, Maryland. The LOD is surrounded by residential properties. Based on review of historical aerial and topographic maps, Germantown Road has been present since 1944. Development in the surrounding area began after 1993 and is similar to current configuration by 2005. Two environmental database listings were identified in the immediate area of the LOD: a fire station (465 feet crossgradient) with a former tank and no reported release, and a gas station (650 feet crossgradient) with 10 former USTs and closed OCP cases. Based on distance, gradient, absence of reported releases, and/or case status, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4084	<p>The LOD is located along the south side of Germantown Road (MD 118), east of Middlebrook Road, in Germantown, Maryland. The LOD is surrounded by commercial development. Based on review of historical aerial and topographic maps, Germantown Road has been present since 1944. Development in the surrounding area began by 1993 and is similar to current configuration by 2005. Six environmental database listings were identified in the immediate area of the LOD including a Sunoco gas station approximately 125 feet to the north. Based on available information on the Sunoco gas station to the north is, the facility was constructed in 2001 and is believed to be crossgradient of the LOD. There are no reported releases associated with the USTs onsite. The remaining five listings either have no releases, or based on distance and/or hydraulic gradient to the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4086	<p>The LOD is located along the central median of Germantown Road (MD 118), southwest of Middlebrook Road, in Germantown, Maryland. The LOD is surrounded by commercial properties. Based on review of historical aerial and topographic maps, Germantown has been present since 1944. Development in the surrounding area began by 1993 and is similar to current configuration by 2005. Eleven environmental database listings were identified in the immediate area of the LOD. The abutting shopping center is in the VCP/LUC database, for which additional information is needed. Based on a review of available information in regards to a Jiffy Lube facility with one 1,000-gallon motor oil AST, thee 2,000-gallon motor oil ASTs one 275-gallon motor oil AST, one 275-gallon transmission fluid AST, and three 875-used oil ASTs approximately 375 feet south (crossgradient) of the LOD, as well as a gas station with known petroleum impacted groundwater, as well as a shopping center part of the MDE Voluntary Cleanup Program to the north (downgradient) with soil and groundwater impacted with chlorinated solvents that received an NFRD in 2004, these sites are not believed to have impacted the LOD.</p>
WAS-4093	<p>The LOD is located along the south side of Shady Grove Road, east of Oakmont Drive, in Gaithersburg, Maryland. The surrounding area is composed primarily of commercial developments. The surrounding area was primarily agricultural and vacant land up until 1981, when commercial development began to occur. Commercial development continued through 2013, when the surrounding area was observed to developed in its current configuration. There are several sites of concern in the vicinity of the LOD. A post office, located 60 feet downgradient from the LOD, has multiple records of concern, including SPILLS, ERNS, an OCP case, USTs and the site is a RCRA facility. Based on a review of available data, residual petroleum impacts are believed to be present around the vehicle maintenance facility on the western side of the property, approximately 245 feet south (downgradient) of the LOD. Additionally, there is a former VCP site, former Sears warehouse, located approximately 270 feet southwest of the LOD. A phase II was conducted in 1997 that identified an area of elevated TPH-DRO in groundwater approximately 500 feet southwest of the LOD. The site is currently utilized as a car dealership. Based on the local topography groundwater is believed to flow towards the south; therefore, both areas of concern are believed to be downgradient of the LOD. Thus, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4096	<p>The LOD is located along the east side S Frederick Avenue (MD 355), south of Central Avenue in Gaithersburg, Maryland. The surrounding area is primarily commercial and residential properties. Commercial and residential development is observed to begin prior to 1959. The surrounding area is observed to be in its current configuration by 2005. An inactive dry cleaner is believed to be located approximately 385 feet upgradient from the LOD; however, there are no documented spills or contamination associated with the facility. Based on distance from the LOD and absence of reported releases, impacts to the LOD are unlikely.</p>
WAS-4098	<p>The LOD is located along the west side of S Frederick Avenue (MD 355), northwest of W Deer Park Road, in Gaithersburg, Maryland. The surrounding area is a mix of commercial and residential developments. The surrounding area was primarily forested and agricultural land up until 1963, when residential and commercial development began to occur. Residential and commercial development continue up until 2018 when the surrounding area was observed to be developed in its current configuration. Although there are several records of concern in area surrounding the LOD, most do not involve releases or contamination or are located over 500 feet from the LOD and are of low concern. One site was listed approximately 50 feet north (upgradient) of the LOD, that had four petroleum USTs ranging in size from 550-gallons to 5,000-gallons excavated and removed from the property in 1991 and 2000 was determined to be more than 700 feet west of the LOD. No releases or impacted soil was reported during the removals. Thus, impacts to the LOD are unlikely.</p>
WAS-4099	<p>The LOD is located in the ROW along S Frederick Avenue (MD 355), south of the intersection with W Deer Park Road, in Gaithersburg, Maryland. The surrounding area is a mix of commercial and residential development. Commercial and residential development is observed to begin by 1963. The surrounding area is observed to be in its current configuration by 2018. The three database listings in the vicinity of the LOD either do not involve releases or contamination or are too far away from the LOD to be of concern.</p>
WAS-4100	<p>The LOD is located along the Pennsylvania Avenue (MD 4) interchange with Forestville Road in District Heights, Maryland. The surrounding area is primarily mixed used commercial/residential. Based on a review of historical imagery, the surrounding area was agricultural in the 1930s with increased residential development to the west-northwest in the 1950s. Commercial development occurred in the 1970s through 1990s. The LOD and surrounding area were observed in its current configuration by the mid-1990s. Eleven facilities listed on one or more environmental database were identified in the surrounding area. The closest of these, located on an adjacent property 90 feet to the north, has two USTs and an open OCP case. Based on a review of MDE files obtained via a PIA request, the case was opened during installation of two new tanks at the site and required testing and submittal of the appropriate documentation before the site could be placed into service. There were no records of releases at the site, therefore, impacts to the LOD are unlikely. The remaining incidents, occurring at distances of between 205 and 605 feet from the LOD, either did not involve a release or were located hydraulically cross- or downgradient from the LOD. Thus, impacts to the LOD from these incidents are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4101	<p>The LOD is located along the southern side of Pennsylvania Avenue (MD 4), immediately east of Forestville Road, in District Heights, Maryland. The surrounding area is primarily mixed used commercial/residential. Based on a review of historical imagery, the surrounding area was agricultural in the 1930s with increased residential development to the west-northwest in the 1950s. Commercial development occurred in the 1970s through 1990s. The LOD and surrounding area were observed in their current configuration by the mid-1990s. The adjacent property to the south, MD State Police, previously had a 550-gallon used oil UST and a 6,000-gallon gasoline UST removed in 1997 and current has one the 12,000-gallon gasoline UST. Review of files provided by MDE through a PIA request determined there have been no substantial releases at the site. An OCP case associated with a motor vehicle accident occurred near the intersection of Pennsylvania Avenue and Forestville Road. The release volume was not listed; however, any release would have been surficial in nature, and was reportedly cleaned up by the local fire department. The remaining records of concern were listed at a distance of 445 feet or greater. Based on case statuses or distances, impacts to the LOD are unlikely.</p>
WAS-4112	<p>The LOD is located along the northern side of Pennsylvania Avenue (MD 4), immediately west of Walters Lane, in District Heights, Maryland. The surrounding area is predominantly residential and commercial properties. Construction of Pennsylvania Avenue, as well as residential development in the surrounding area, began in the late 1950s. Commercial development began in the 1970s, and the surrounding area appeared in their current configuration by 2005. Seven facilities in the surrounding area were listed on one or more environmental database. The most concerning of these is a gas station located 280 feet southeast from the LOD. This gas station has multiple closed and active USTs, OCP cases, and has a history of environmental impacts. Review of MDE files indicated that remediation activities were conducted for the OCP cases and they were all closed to MDE's satisfaction. However, there are several spill reports, including for tightness testing failures, for which there was no additional information in the files. Although this facility has a history of impacts, and information on certain incidents were not available, this site appears to be located downgradient of the LOD. Based on the distance and hydraulic direction, impacts to the LOD from this gas station are unlikely. The remaining listed facilities were located at distances of between 300 and 590 feet, in a cross- or downgradient direction. Thus, impacts to the LOD from these facilities are unlikely.</p>
WAS-4121	<p>The LOD is located in a center median along Pennsylvania Avenue (MD 4), northwest of Silver Hill Road, in District Heights, Maryland. The surrounding area is mixed residential and commercial properties. Construction of Pennsylvania Avenue as well as residential development in the surrounding area began in the late 1950s. Commercial development is visible starting in the 1970s. The LOD and surrounding area appeared in their current configuration by 2005. Six facilities in the surrounding area were listed on the OCP, SPILL, HMIRS, RCRA Generators or Dry Cleaner databases. The closest record, a SPILLS incident occurring 230 feet from the LOD, involved only a minor 2-gallon release of hydraulic fluid. An OCP case for dumping, which has since been closed, was noted 319 feet from the LOD. The remaining records were listed at distances of 466 feet to 925 feet from the LOD. Based on the distances from the LOD to these facilities and the nature of the incidents, impacts to the LOD from these sites are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4122	<p>The LOD is located primarily in a center median along Pennsylvania Avenue (MD 4), at Penn Street, in District Heights, Maryland. The northwestern portion of the LOD extends southwest, across Pennsylvania Avenue. The surrounding area is mixed residential, commercial and educational properties. Construction of Pennsylvania Avenue as well as residential development in the surrounding area began in the late 1950s. Commercial development is visible starting in the 1970s. The LOD and surrounding area appeared in their current configuration by 2005. Two sites were flagged for being either on the OCP or ERNS databases; however, the OCP case is located 550 feet from the LOD, and the ERNS incident only involved a small quantity release (1.5 gallons) to an impervious surface. Based on the distances from the LOD to these facilities and the nature of the incidents, impacts to the LOD from these sites are unlikely.</p>
WAS-4123	<p>The LOD is located primarily in a center median along Pennsylvania Avenue (MD 4), immediately southeast of Brooks Drive, in District Heights, Maryland. A portion of the LOD near the center extends north, across Pennsylvania Avenue. The surrounding area is mixed residential, commercial and educational properties. Construction of Pennsylvania Avenue as well as residential development in the surrounding area began in the late 1950s. Commercial development is visible starting in the 1970s. The LOD and surrounding area appeared in their current configuration by 2005. Three sites were flagged for being either on the UST, OCP or ERNS databases; however, these sites were located at distances between 463 and 637 feet from the LOD. Based on these distances, impacts to the LOD from these sites are unlikely.</p>
WAS-4124	<p>The LOD is located primarily in a center median along Pennsylvania Avenue (MD 4), immediately northwest of Brooks Drive, in District Heights/Suitland, Maryland. The northwest end of the LOD extends south, across Pennsylvania Avenue. The surrounding area is predominantly residential properties with parkland/forested areas to north/northeast. Construction of Pennsylvania Avenue as well as residential development in the surrounding area began in the late 1950s. The LOD and surrounding area appeared in their current configuration by 2018. Three sites were flagged for being either on the UST, OCP or SPILLS databases; however, these sites were located at distances of between 473 and 523 feet from the LOD. Based on these distances, impacts to the LOD from these sites are unlikely.</p>
WAS-4125	<p>The LOD is located within the center median of Pennsylvania Avenue (MD 4), immediately east of Quarter Avenue, in Capitol Heights/Suitland, Maryland. The LOD and surrounding area are predominantly residential properties with parkland to the immediate north. The LOD appeared as undeveloped land until the late 1950s when Pennsylvania Avenue was constructed. Residential development in the surrounding area began in the late 1950s and the surrounding area appeared in its current configuration by 2005. One record of concern, a spill incident involving one gallon of heating oil, occurred 140 feet upgradient of the LOD. Based on the limited quantity of this release, impacts to the LOD from this incident is unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4127	<p>The LOD is located within the center median of Pennsylvania Avenue (MD 4), west of Quarter Avenue/Spaulding Avenue, in Capitol Heights/Suitland, Maryland. The LOD and surrounding area are predominantly residential properties with parkland to the immediate north. The LOD appeared as undeveloped land until the late 1950s when Pennsylvania Avenue was constructed. Residential development in the surrounding area began in the late 1950s and the surrounding area appeared in its current configuration by 2005. An OCP case occurred 629 feet to the north and a SPILLS incident 650 feet to the southeast. Based on the distances of these records, impacts to the LOD are unlikely.</p>
WAS-4132	<p>The LOD is located in a center median of Silver Hill Road (MD 458), between Royal Plaza Drive and Sunset Lane, in Suitland, Maryland. The surrounding area is predominantly residential and educational properties. Construction of Silver Hill Road was observed as early as 1937 and residential development in the surrounding area began in the late 1950s. The LOD and surrounding area appeared in their current configuration by 2009. A HMIRS case located 126 feet from the LOD involved the release of 5 gallons of fuel oil to the surface. The spilled fuel oil was contained and cleaned up. The adjacent Suitland School District property, which includes the Suitland High School and the former La Reine High School, was listed on the UST, OCT and RCRA SQG databases. One active 8,000-gallon heating oil UST is present. In addition, two 550-gallon used oil USTs were removed in 2004 and one 10,000-gallon heating oil UST was removed in 2007. An OCP case associated with the 2007 UST removal was closed in two months later. Two older OCP cases were also listed. In December 1994, an OCP case was opened for soil contamination (motor/lube oil). No remedial information was available, but the OCP case was closed 3 months later. In August 1990, an OCP was opened for unspecified purposes. This case was closed in May 1991. Finally, the high school was listed as a small quantity generator of ignitable, corrosive and reactive wastes. The Suitland school property is large, and it is believed that these incidents likely occurred at a significant distance from the LOD (>500 feet). Based on the anticipated distance and case status, impacts to the LOD from the Suitland School District property are unlikely.</p>
WAS-4134	<p>The LOD is located in the central median of Branch Avenue (MD 5), west of Beech Road, in Temple Hills, Maryland. The surrounding area is mixed-use residential/commercial. Based on a review of historical imagery, residential development began in the 1940s with commercial development continuing in the 1970s. The LOD and surrounding area was observed to be developed in its current configuration by the early 1980s. The large commercial property immediately north was listed on the RCRA Non-Gen database, meaning waste generation occurred in the past no longer occurs, as well as on the SPILLS database for a three-gallon release of sewage. Sewage is not considered an environmental concern. An auto dealership located 250 feet to the west had a 500-gallon used oil UST removed in 1990. No release was reported. The remaining records were for an additional RCRA generator listing and sewage release. Based on the status, distances or spill material released, impacts to the LOD from these incidents are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4135	<p>The LOD is located in the center median of Branch Avenue (MD 5), northwest of Beech Road, in Temple Hills, Maryland. The surrounding area is a mix of residential and commercial development. Development of the surrounding area is observed to have begun around 1949, and is in its current configuration by 2005. The surrounding area includes six facilities listed on either the SPILLS, UST, OCP and/or RCRA Generator database; however, these facilities are located 405 feet or greater from the LOD. Based on these distances, impacts to the LOD are unlikely.</p>
WAS-4137	<p>The LOD is located along the northern side of Pennsylvania Avenue (MD 4), west of Walters Lane, in District Heights, Maryland. The surrounding area is predominantly residential properties, consisting of either single-family homes or apartment complexes. Construction of Pennsylvania Avenue as well as residential development began in the 1950s and continued through the 2000s. The LOD and surrounding area appeared in their current configuration by 2005. One record of concern, an ERNS case from 1994, was associated with a natural gas pipeline explosion that occurred in the apartment complex to the south. Based on the incident type, impacts to the LOD are unlikely.</p>
WAS-4138	<p>The LOD is located within the center median of Pennsylvania Avenue (MD 4), immediately east of Quarter Avenue, in Capitol Heights/Suitland, Maryland. The LOD and surrounding area are predominantly residential properties with parkland to the immediate north. The LOD appeared as undeveloped land until the late 1950s when Pennsylvania Avenue was constructed. Residential development in the surrounding area began in the late 1950s and the surrounding area appeared in its current configuration by 2005. One record of concern, a spill incident involving one gallon of heating oil, occurred 165 feet upgradient of the LOD. Based on the limited quantity of this release, impacts to the LOD from this incident is unlikely.</p>
WAS-4140	<p>The LOD is located within the center median of Pennsylvania Avenue (MD 4), east of Alton Street/Shadyside Avenue, in Capitol Heights/Suitland, Maryland. The LOD and surrounding area are predominantly residential properties with parkland to the immediate north. The LOD appeared as undeveloped land until the late 1950s when Pennsylvania Avenue was constructed. Residential development in the surrounding area began in the late 1950s and the surrounding area appeared in its current configuration by 2005. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4141	<p>The LOD is located along the southern side of Silver Hill Road (MD 450), between Royal Plaza Drive and Sunset Lane, in Suitland, Maryland. The LOD is T-shaped, with the center portion extending south. The surrounding area is predominantly residential and educational properties. Construction of Silver Hill Road was observed as early as 1937 and residential development in the surrounding area began in the late 1950s. The LOD and surrounding area appeared in their current configuration by 2009. A HMIRS case located 75 feet from the LOD involved the release of 5 gallons of fuel oil to the surface. The spilled fuel oil was contained and cleaned up. The adjacent Suitland School District property to the north, which includes the Suitland High School and the former La Reine High School, was listed on the UST, OCT and RCRA SQG databases. One active 8,000-gallon heating oil UST is present. In addition, two 550-gallon used oil USTs were removed in 2004 and one 10,000-gallon heating oil UST was removed in 2007. An OCP case associated with the 2007 UST removal was closed in two months later. Two older OCP cases were also listed. In December 1994, an OCP case was opened for soil contamination (motor/lube oil). No remedial information was available, but the OCP case was closed 3 months later. In August 1990, an OCP was opened for unspecified purposes. This case was closed in May 1991. Finally, the high school was listed as a small quantity generator of ignitable, corrosive and reactive wastes. The Suitland school property is large, and it is believed that these incidents likely occurred at a significant distance from the LOD (>500 feet). Based on the anticipated distance and case status, impacts to the LOD from the Suitland School District property are unlikely.</p>
WAS-4153	<p>The LOD is located on the east side of Woodfield Road (MD 124), just south of Augusta Farm Lane/ Essex View Drive, in Laytonsville, Maryland. The LOD consists of part of Woodfield Road, the remainder is grassed. The surrounding area is residential, and was developed from the late 1960's to the early 1990's, when the surrounding area was observed to similar to its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4154	<p>The LOD is located along the east side of Old Hundred Road (MD 109), southwest of Comus Road, in Dickerson, Maryland. The surrounding area is primarily rural agricultural land with a few residential and commercial properties northeast of the LOD. Based on review of historical imagery, no substantial changes have occurred to the surrounding area since the early 1980s. A former gas station believed to be approximately 595 feet crossgradient of the LOD has three database listings, including two closed OCP cases and listings for former USTs. Based on the distance of the site relative to the LOD, impacts are unlikely.</p>
WAS-4155	<p>The LOD is located along the west side of Old Hundred Road (MD 109), north of Barnesville Road, in Dickerson, MD. The surrounding area is primarily rural land to the east and forested land to the west. Based on review of historical imagery, no substantial changes have occurred to the surrounding area since the late 1950s. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4157	<p>The LOD is located along the west side of N Fredrick Road (MD 355), north of Ridge Road (MD 27), in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the north and west, commercial development to the south, and the Ridge Road Recreational Park to the east. Based on the 1959 aerial photograph, Frederick Road and Ridge Road were present and the LOD and surrounding areas were agricultural land. Residential development started by 1993. Commercial development started by 2005, and the LOD and surrounding areas were similar to their current configuration by 2005. A gas station located 715 feet to the south was identified as a RCRA SQG with no reported violations or releases. One spill case and gas station were identified in the records search report, approximately 715 feet and 600 feet, respectively from the LOD. A third site associated with an OCP case was listed as being approximately 60 feet south of the LOD; however, based on further review the site is more than 1.5 mile from the LOD. Based on the proximity of the three sites relative to the LOD, impacts are unlikely.</p>
WAS-4158	<p>The LOD is located along the west side of N Fredrick Road (MD 355), north of Ridge Road (MD 27), in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the north and west, commercial development to the south, and the Ridge Road Recreational Park to the east. Based on historical aerial and topographic maps, the LOD has never been developed, but has been part of agricultural land. Based on the 1959 aerial photograph, Frederick Road and Ridge Road were present and the LOD and surrounding areas were agricultural land. Residential development started by 1993. Commercial development started by 2005, and the LOD and surrounding areas were similar to their current configuration by 2005. A gas station located 715 feet to the south was identified as a RCRA SQG with no reported violations or releases. One spill case and gas station were identified in the records search report, approximately 635 feet and 505 feet, respectively from the LOD. A third site associated with an OCP case was listed within the LOD; however, based on further review the site is more than 1.5 mile from the LOD. Based on the proximity of the three sites relative to the LOD, impacts are unlikely.</p>
WAS-4159	<p>The LOD is located along the north side of Ridge Road (MD 27), west of N Frederick Road (MD 355), in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the north and west, commercial development to the south, and the Ridge Road Recreational Park to the east. Based on the 1959 aerial photograph, Frederick Road and Ridge Road were present and the LOD and surrounding areas were agricultural land. Residential development started by 1993. Commercial development started by 2005, and the LOD and surrounding areas were similar to their current configuration by 2005. A gas station located 715 feet to the south was identified as a RCRA SQG with no reported violations or releases. One spill case and gas station were identified in the records search report, approximately 625 feet and 560 feet, respectively from the LOD. A third site associated with an OCP case was listed within the LOD; however, based on further review the site is more than 1.5 mile from the LOD. Based on the proximity of the three sites relative to the LOD, impacts are unlikely.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-4160	<p>The LOD is located along the north side of Ridge Road (MD 27), east of N Frederick Road (MD 355), in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the east, commercial development to the south, and west, and the Ridge Road Recreational Park to the north. Based on historical aerial and topographic maps, the LOD was developed as Ridge Road by 2005. Three environmental database listings were identified in the immediate area of the LOD, while one site was misplotted and was found to be over 1.5 mile west of the LOD. A surficial spill a quarter of gallon of petroleum was reported approximately 60 feet of the LOD. The material was reported addressed. An Exxon gas station was listed approximately 630 feet south (downgradient) of LOD. A 7-Eleven gas station is located approximately 210 feet south (downgradient) of the LOD that currently has two gasoline USTs (15,000 gallon and 10,000 gallon) installed in 2010. The station is listed as a minor air source. A SPILL record was reported on 10/5/2015 for the underground contaminant system. There was no release, but there was an error with the system holding air. Based on the proximity of these sites relative to the LOD, impacts are believed to be unlikely.</p>
WAS-4161	<p>The LOD is located along the north side of Ridge Road (MD 27), east of N Frederick Road (MD 355), in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the east, commercial development to the south, and by the Ridge Road Recreational Park to the north and west. Based on historical aerial and topographic maps, the LOD has never been developed. Based on the 1959 aerial photograph, Frederick Road and Ridge Road were present and the LOD and surrounding areas were agricultural land. Residential development started in 1993. Commercial development started by 2005, and the LOD and surrounding areas were relative to their current configuration by 2005. A surficial spill a quarter of gallon of petroleum was reported approximately 435 feet of the LOD. The material was reported addressed. A 7-Eleven gas station is located approximately 385 feet south (downgradient) of the LOD that currently has two gasoline USTs (15,000 gallon and 10,000 gallon) installed in 2010. The station is listed as a minor air source. A SPILL record was reported on 10/5/2015 for the underground contaminant system. There was no release, but there was an error with the system holding air. Based on the proximity of these sites relative to the LOD, impacts are believed to be unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4162	<p>The LOD is located along the west side of N Frederick Road (MD 355), north of Henderson Corner Road, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land to the north, commercial development to the west, east, and south. Based on historical aerial and topographic maps, the LOD has never been developed, but has been part of agricultural land. Based on the 1959 aerial photograph, Frederick Road and Ridge Road were present and the LOD and surrounding areas were agricultural land. Residential development started in 1993. Commercial development started by 2005, and the LOD and surrounding areas were relative to their current configuration by 2005. A gas station is located approximately 160 feet to the east (upgradient) of the LOD. Currently, there are three active 12,000-gallon gasoline USTS registered to the facility that were installed in 1995. The gas station is a SQG of ignitable waste and benzene; no violations were found. Two OCP cases are associated with the gas station, one opened in 1995 for the installation of the three currently active USTs and another one opened in 2007 for the removal of two 40-gallon hydraulic oil tanks. Based on analytical results soils around the two former tanks were not impacted. Several small releases associated with petroleum are also documented at the site but are believed to not be a concern. Thus, impacts to the LOD from the gas station are unlikely. Two other sites were listed in the environmental database report; however, based on the distance or type of listing, impacts to the LOD are unlikely.</p>
WAS-4165	<p>The LOD is located along the north side of Quince Orchard (MD124) Road, west of Great Seneca Highway (MD 119), in Gaithersburg, Maryland. The LOD is surrounded by residential development to the north, south, and west and commercial development to the east. Based on review of historical aerial and topographic maps Quince Orchard Road has been present since at least 1944. Residential and commercial development occurred by 1993. The surrounding area was observed to be developed in its current configuration around 2005. According to the environmental database report, three sites were listed in the vicinity of the LOD. Of those three sites, two of them had former/current USTs, reported spills, and/or OCP cases associated with them. One of those sites, a gas station is located approximately 130 feet south (downgradient) of the LOD. The facility has four active 10,000-gallon gasoline USTs present onsite. There have been no reported releases associated with the USTs. Several surficial releases associated with vehicles have occurred at the facility; however, since the releases are not believed to have impacted subsurface media, impacts to the LOD are unlikely.</p>
WAS-4200	<p>The LOD is located along the west side of Dickerson Road (MD 28), transecting and north of the intersection with Mouth of Monocacy Road, in Dickerson, Maryland. The surrounding area is a mix of commercial and residential properties, agricultural land, and forested areas. In 1959 the town was primarily agricultural and residential properties. The surrounding area was observed to be developed in its current configuration prior to 1981. The environmental database report listed the Ellis L. Roberson property, approximately 435 feet to the south (crossgradient) as having three 1,000-gallon gasoline USTs that excavated and removed from the site in 1976 and no petroleum release was reported. Based on the distance and inferred hydraulic gradient, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4202	<p>The LOD is located along the east side of Dickerson Road (MD 28), north of the intersection with Nicholson Farm Road, in Dickerson, Maryland. The surrounding area is a mix of commercial and residential properties, rural agricultural land, and forested areas. A railway is situated approximately 300 feet south. In 1959 the town was primarily agricultural and residential properties. The surrounding area was observed to be developed in its current configuration around 1981. An auto repair facility and former waste management company known as Dickerson Auto/ Titan Trash Service is located approximately 240 feet crossgradient of the LOD. The site is listed as a RCRA very small quantity generator of ignitable waste. The FINDS and ICIS databases list the site as having a regulated air permit. One 10,000-gallon diesel UST (installed in 1991) was excavated and removed from the site in 2008. Available records indicated that no impacted material was encountered and remediation/ cleanup was not required during the closure of the UST. Two other OCP cases are associated with the facility, one OCP case was opened in 1990 for an unknown reason and closed in 1995. The second OCP was opened for a compliance inspection in 2008. Based on historical imagery, the former USTs were at least 250 feet of the LOD. Several other sites with former USTs and OCP cases are believed to be located between 390 feet and 445 feet south (crossgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4203	<p>The LOD is located along the west side of Dickerson Road (MD 28), between Nicholson Farm Road and Mt. Ephraim Road, in Dickerson, Maryland. The surrounding area is a mix of commercial and residential properties, rural agricultural land, and forested areas. A railway is situated south and adjacent to the LOD. In 1959 the town was primarily agricultural and residential properties. The surrounding area was observed to be developed in its current configuration in around 1981. The environmental database report listed Dickerson Auto Center, a commercial auto body and paint shop and Titus Trash Service approximately 300 feet to the west of the LOD. Based on the local topography they are believed to be crossgradient to the LOD.. The site was listed in the FINDS/FRS and ICIS databases as having an air permit for auto paint activities. No violations were noted. Three OCP compliance violations were reported at the site from 1995 to 2010 with no environmental releases reported. A 10,000-gallon diesel tank was removed from the site in 1991 with no issues. The Dickerson Market approximately 515 feet south (downgradient) has five OCP cases from 1984 to 2008 for compliance and tank removal that are closed. The UST database indicates three gasoline and two diesel USTs currently in use and eight former USTs removed from the site. There are no current violations associated with this site. Based on the inferred hydraulic gradient of these sites (crossgradient/ downgradient) relative to the LOD, impacts are believed to be unlikely.</p>
WAS-4204	<p>The LOD is located along the East side of Dickerson Road (MD 28), south of Dickerson Church Road, in Dickerson, Maryland. The surrounding area is a mix of rural agricultural land, forested areas and residential properties. The surrounding area is primarily rural agricultural and forested land with some residential properties intermixed throughout. No substantial changes have been observed to the surrounding area since 1959. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4205	<p>The LOD is located along the west side of Darnestown Road (MD 28), northwest of W. Hunter Road, in Dickerson, Maryland. The LOD consists of agricultural and residential land. The surrounding area is agricultural land, residential properties and forest areas. No substantial changes have been observed to the surrounding area, with the exception of a residential property to the west that was constructed around the late 1960s/ early 1970s. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4206	<p>The LOD is situated on the east side of Dickerson Road (MD 28), northeast of Darnestown Road and Martinsburg Road, in Dickerson, Maryland. The surrounding area is observed to be agricultural and forested land, with the exception of several residences to the north, along Dickerson Road. The Little Monocacy River is located just west and southwest of the LOD. A residential structure was previously located to the northwest of the LOD; however, it was not observed after 2006. No records of concern in the vicinity of the LOD were identified during this environmental review.</p>
WAS-4208	<p>The LOD is located along the north side of Darnestown Road (MD 28), southeast of Beallsville Road, in Beallsville, Maryland. A custom home building company, fire station, and ballpark are located to the north/northwest. Forested land is to the northeast of the LOD. Residential properties are located to the south. Residential and commercial properties are located to the west and southwest. Based on historical aerial and topographic maps, the surrounding area was observed to be primarily agricultural land up until 1944 when residential development began to occur. Development in the surrounding area continued up until approximately 1993, when the surrounding area was observed to be developed in its current configuration. Two sites with former USTs and/or OCP cases were listed in the environmental database report. The first site is fire station, approximately 345 feet to the northwest, was listed as having six former petroleum USTs ranging in size from 300-gallons to 2,000-gallons registered to the property. All six USTs were excavated and removed from the site between 1990 and 2010. Based on a review of available data provided by MDE through a PIA request, no substantial releases to soil and/or groundwater were identified during the closure and removal of the USTs. Currently, the facility has a 2,000-gallon heating oil AST present onsite. The second site is a former restaurant located approximately 570 feet west of the LOD. According to available records, an OCP case related to a compliance inspection was opened in 1995 and closed approximately 8 months later. Records did not indicate that a release was identified or cleanup/ remediation was required. Based on the local topography, both sites are believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4212	<p>The LOD is located along the east side of Beallsville Road (MD 109), south of Big Woods Road, in Dickerson, Maryland. The surrounding area is comprised of agricultural land, residential properties and forested areas. The LOD consists of a portion of Beallsville Road and agricultural land. Forested areas and residential properties are situated north, south and west across Beallsville Road. The area was primarily agricultural and residential properties in 1959. The surrounding area was observed to be developed in its current configuration by 1971. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4214	<p>The LOD is located along the east side of Beallsville Road (MD 109), north of Big Woods Road, in Dickerson, Maryland. The surrounding area is comprised of agricultural land, residential properties and forested areas. The LOD is on a portion of Beallsville Road and was primarily agricultural land since 1959. The surrounding area was observed to be developed in its current configuration in 2006. Two sites with OCP cases were identified in the environmental database report. The first site is a residential property approximately 220 feet west (downgradient) of the LOD that had a reported release of approximately 150-gallons of heating from a ruptured AST located in the basement of the structure in April 2015. The spill was cleaned up and the incident was closed on December 2015. Since the release occurred inside the structure and the site is located downgradient of the LOD, impacts are unlikely. The second site is an excavating company approximately 425 feet northwest (crossgradient) of the LOD. The UST database lists six diesel USTs ranging from 15,000 to 20,000-gallons that were permanently removed from the site between 1992 to 2000. One of the USTs was found to have impacted the surrounding area during its removal. The release was cleaned up and the case closed on in February 2001. A second release in the OCP was reported for a surface spill from a motor/lube tank in October 1995. The case was closed in August 1996. Based on the nature and proximity of the incidents/ releases summarized above, impacts to the LOD are unlikely.</p>
WAS-4215	<p>The LOD is located along the west side of Beallsville Road (MD 109), north of Big Woods Road, in Dickerson Maryland. Forested areas and residential properties are situated north, west, and southwest of the LOD. Agricultural land is east of the LOD across Beallsville Road. The area was primarily agricultural and residential properties in 1959. The surrounding area was observed to be developed in its current configuration in 2006. Two sites with OCP cases were identified in the environmental database report. The site is an excavating company approximately 570 feet west (crossgradient) of the LOD. The UST database lists six diesel USTs ranging from 15,000 to 20,000-gallons that were permanently removed from the site between 1992 to 2000. One of the USTs was found to have impacted the surrounding area during its removal. The release was cleaned up and the case closed on in February 2001. A second release in the OCP was reported for a surface spill from a motor/lube tank in October 1995. The case was closed in August 1996. The second site is associated with a residential property approximately 215 feet southwest (downgradient) of the LOD that had a reported release of approximately 150-gallons of heating from a ruptured AST located in the basement of the structure in April 2015. The spill was cleaned up and the incident was closed in December 2015. The second site is associated. Based on the nature and proximity of the incidents/ releases summarized above, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4216	<p>The LOD is located along the east side of Beallsville Road (MD 109), north of Big Woods Road, in Dickerson Maryland. Forested areas and residential properties are situated north, west, and southwest of the LOD. Agricultural land is east of the LOD across Beallsville Road. The area was primarily agricultural and residential properties in 1959. The surrounding area was observed to be developed in its current configuration in 2006. Two sites with OCP cases were identified in the environmental database report. The site is an excavating company approximately 430 feet west (crossgradient) of the LOD. The UST database lists six diesel USTs ranging from 15,000 to 20,000-gallons that were permanently removed from the site between 1992 to 2000. One of the USTs was found to have impacted the surrounding area during its removal. The release was cleaned up and the case closed on in February 2001. A second release in the OCP was reported for a surface spill from a motor/lube tank in October 1995. The case was closed in August 1996. The second site is associated with a residential property approximately 200 feet southwest (downgradient) of the LOD that had a reported release of approximately 150-gallons of heating from a ruptured AST located in the basement of the structure in April 2015. The spill was cleaned up and the incident was closed in December 2015. The second site is associated. Based on the nature and proximity of the incidents/ releases summarized above, impacts to the LOD are unlikely.</p>
WAS-4218	<p>The LOD is located on the east side of Beallsville Road (MD 109), south of Big Woods Road, in Dickerson, Maryland. The LOD consists of a portion of Beallsville Road and an agricultural property in the ROW. Residential properties with forested areas are situated north and west of the LOD. Agricultural land is found east of the LOD and generally throughout the entire area. The Town of Beallsville and a golf course are located to the south. The surrounding area is primarily comprised of agricultural land and forested areas. The area was primarily agricultural land in 1959. The surrounding area was observed to be developed in its current configuration in 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4304	<p>The LOD is located along West side of Fisher Avenue (MD 107), northwest of Tom Fox Avenue, in Poolesville, Maryland. The LOD is surrounded by residential properties to the north and east, by a church to the west, and forest to the south. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the LOD is parallel to existing Fisher Avenue on agricultural land surrounded by farm properties. Residential development with residences on small tracts of land in the surrounding area occurred between 1972 and 1995. The surrounding area was observed to be developed in its current configuration around 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4310	<p>The LOD is located west of Fisher Avenue (MD 107), northwest of Tom Fox Avenue, in Poolesville, Maryland. A portion of the LOD follows the residential property line to the west. The LOD is surrounded by residential properties to the north, east, and west and by a church to the south. The eastern portion of the LOD has been Fisher Avenue since 1959. Residential development with residences on small tracts of land in the surrounding area occurred between 1972 and 1995. The surrounding area was observed to be developed in its current configuration around 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4321	<p>The LOD is located along the west side N. Frederick Road (MD 355), north of Germantown Road, in Germantown, Maryland. The LOD is surrounded by multi-family residential properties to the west, commercial to the north and south, and Neelsville Middle School to the east. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Development in the surrounding area began by 1981 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. Two environmental database listings were identified in the vicinity of the LOD, including a property with former 550-gallon gasoline UST (removed in 1999) and an active gas station with former and currently active UST onsite that has documented impacted soil and groundwater were identified between 75 feet and 135 feet west/southwest (crossgradient) of the LOD. Based on a review of available information provided by MDE through a PIA request. Impacts from these sites appear to be isolated to their respective properties or to the west/northwest (downgradient) of the LOD. Thus, impacts are unlikely.</p>
WAS-4322	<p>The LOD is located along the west side of N. Frederick Road (MD 355), north of Collins Drive, in Germantown, Maryland. The LOD is located in the southbound lanes, sidewalk and adjacent landscaped area. The LOD is surrounded by multi-family residential properties to the west, commercial to the north and south, and Neelsville Middle School to the east. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Development in the surrounding area began by 1981 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. Six environmental database listings were identified in the immediate area of the LOD. Five of which had former/ active USTs, OCP cases, or documented spills. A gas station and church/school, and fire station with former USTs and/or known releases are located between 400 and 650 feet north (crossgradient) of the LOD, as well as facility with a former UST and gas station property between 350 and 375 feet south (crossgradient) of the LOD. Based on a review of available information provided by MDE through a PIA request for these sites, impacts are unlikely since it is believed that the sites are crossgradient of the LOD.</p>
WAS-4323	<p>The LOD is located along the east side of N. Frederick Road (MD 355), north of the intersection with Collins Drive, in Germantown, Maryland. The LOD is located in the southbound lanes, sidewalk and adjacent landscaped area. The LOD is surrounded by multi-family residential properties to the west, commercial to the north and south, and Neelsville Middle School to the east. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Development in the surrounding area began by 1981 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. Six environmental database listings were identified in the immediate area of the LOD. Of those six sites, five sites had former/ active USTs, OCP cases, or documented spills. The middle school does not have any reported releases. A gas station and church/school, and fire station with former USTs and/or known releases are located between 390 and 650 feet north (crossgradient) of the LOD, as well as facility with a former UST and gas station property between 360 and 375 feet south (crossgradient) of the LOD. Based on a review of available information provided by MDE through a PIA request for these sites, impacts are unlikely since it is believed that the sites are crossgradient of the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4324	<p>The LOD is located along the west side of N. Frederick Road (MD 355), north of Appledowre Way, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land. The Montgomery College is located to the west. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Based on review of the 1959 aerial the LOD and surrounding areas were residential with agricultural land. Residential and commercial development was observed on the 1993 aerial and continued through 2006, when the surrounding area was observed to be developed in its current configuration. Two environmental database listings were identified in the immediate area of the LOD. The first site is a restaurant (155 feet crossgradient) with no releases or violations found. The second site is associated with a trailer park approximately 305 feet to the north (crossgradient) that had a OCP case open in January 1992 and closed approximately 3 months later. There was no reported release or cleanup required. Thus, impacts to the LOD are unlikely.</p>
WAS-4325	<p>The LOD is located along the west side of N Frederick Road (MD 355), south of Appledowre Way, in Germantown, Maryland. The LOD is surrounded by residential properties on small tracts of land. The Boys & Girls Club is located to the south. The Holy Cross Germantown Hospital is located to the southwest. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Based on review of the 1959 aerial, the LOD and surrounding areas were residential with agricultural land. Residential and commercial development was observed on the 1993 aerial. The LOD and surrounding areas are similar to their current configuration by 2006. One FINDS listing was identified in the immediate area of the LOD, which is a restaurant located approximately 575 feet to the north. No releases or violations were found and together with the distance from the LOD, impacts to the LOD are unlikely.</p>
WAS-4331	<p>The LOD is located along the east side of Bucklodge Road (MD 117), southwest of Whites Store Road, in Boyds, Maryland. The LOD is surrounded by residences on large tracts of land. In addition, a forested area is located to the north, with agricultural property to the south, east, and west. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences to the south. Residential development with residences on large tracts of land in the surrounding area has been similar to their current configuration since 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4333	<p>The LOD is located along the east side of Bucklodge Road (MD 117), southwest of Whites Store Road, in Boyds, Maryland. The LOD is surrounded by forests to the north and west and residential to the south and east. The surrounding area consists of residences on large tracts of land and agricultural property. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences to the south. Residential development with residences on large tracts of land in the surrounding area has been similar to their current configuration since 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4334	<p>The LOD is located along Bucklodge Road (MD 117), at the intersection with Whites Store Road, in Boyds, Maryland. The LOD is surrounded by residential properties on large tracts of land and agricultural property. A stream is located just west of the LOD. Based on historical aerial and topographic maps, Bucklodge Road has been present since at least 1944. The portion of the LOD east of Bucklodge Road has not been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences to the south. Residential development with residences on large tracts of land in the surrounding area has been similar to their current configuration since 2005. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4335	<p>The LOD is located along the eastern side of Bucklodge Road (MD 117), northeast of the intersection with Old Bucklodge Lane in Boyds, Maryland. The surrounding area is primarily forested with areas to the west. A residential property is located across Bucklodge Road, with a railroad right-of-way beyond. Based on historical aerial and topographic maps, the surrounding area has been mixed forested and agricultural lands since at least 1944. One record of concern, a SPILLS record from 2017, was listed in the environmental database as being within the LOD; however, further evaluation has concluded that this record was mis-mapped and did not occur at or near the LOD. Based on this, no records of concern were identified during this environmental review.</p>
WAS-4336	<p>The LOD is located along the north side of Bucklodge Road (MD 117), east of Buck Ridge Road, in Boyds, Maryland. The LOD is surrounded by residential properties on large tracts of land and agricultural property. A railroad is located to the south. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences to the north and south. The railroad is also located to the south. Residential development with residences on large tracts of land in the surrounding area has been similar to their current configuration since 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4337	<p>The LOD is located along the north side of Bucklodge Road (MD 117), west of Barnesville Road, in Boyds, Maryland. The LOD is surrounded by residential properties on large tracts of land and agricultural property. A railroad is located to the south. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences to the north and south. Residential development began around the 1970s and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-4338	<p>The LOD is located along the north side of Bucklodge Road (MD 117) west of Barnesville Road, in Boyds, Maryland. The LOD is surrounded by residential properties on large tracts of land and agricultural property. A railroad is located to the south. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences to the north and south. Residential development began around the 1970s and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4339	<p>The LOD is located along the south side of Bucklodge Road (MD 117), west of Barnesville Road (also MD 117), in Boyds, Maryland. The LOD is surrounded by residential properties on large tracts of land and agricultural property. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences to the north and south. A railroad is located to the south. Residential development with residences on large tracts of land in the surrounding area has been similar to their current configuration since 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4342	<p>The LOD is located along the side of Bucklodge Road (MD 117), north of Moore Road, in Boyds, Maryland. The LOD is surrounded by agricultural land to the north, south, east, and west. Residences on large tracts of land are in the surrounding areas. Based on historical aerial and topographic maps, Bucklodge Road has been present since at least 1944 and the portion of the LOD east of the road has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural. Residential development with residences on large tracts of land in the surrounding area has been similar to their current configuration since 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4345	<p>The LOD is located along the side of Bucklodge Road (MD 117), south of Moore Road, in Boyds, Maryland. The LOD is surrounded by agricultural land to the north, south, east, and west. Residences on large tracts of land are in the surrounding areas. The Rickman Farm Horse Park is located to the west and boarding stables are located to the east. A stream is present to the south of the LOD. Based on historical aerial and topographic maps, Bucklodge Road has been present since at least 1944 and the portion of the LOD east of the road has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences on large tracts of land. The surrounding area has been similar to its current configuration by 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

WAS-4347	<p>The LOD is located along the east side of Bucklodge Road (MD 117), south of Moore Road, in Boyds, Maryland. The LOD is surrounded by agricultural land to the north, south, and west and by residential to the east. Residences on large tracts of land are in the surrounding areas. The Rickman Farm Horse Park is located to the northwest and a boarding stable is located to the northeast. A stream is located just south of the LOD. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. Based on the 1959 aerial photographs, the surrounding area appeared to be agricultural with residences on large tracts of land. The surrounding area has been similar to its current configuration by 2005. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4349	<p>The LOD is located along the east side of Bucklodge Road (MD 117), north of Darnestown Road (MD 28), in Boyds, Maryland. The LOD is surrounded by agricultural land to the north, south, east, and west. Residences on large tracts of land are in the surrounding areas. The Rickman Farm Horse Park is located to the northwest. Based on historical aerial and topographic maps, Bucklodge Road has been present since 1944 and the east portion of the LOD has never been developed; however, it has been part of agricultural property. The surrounding area has been similar to its current configuration by 2005. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4352	<p>The LOD is located northeast of the intersection of Darnestown Road (MD 28) and Bucklodge Road (MD 117), in Boyds, Maryland. The LOD is surrounded by agricultural land to the north, south, and west, and forested area to the east. A stream is located just east of the LOD. A farm is located to the south, beyond Darnestown Road. Based on historical aerial and topographic maps, Darnestown Road and Bucklodge Road have been present since at least 1944, and the portion of the LOD adjacent to these roadways has never been developed; however, it has been part of agricultural property. The surrounding area has been similar to its current configuration since 1959. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4353	<p>The LOD is located northwest of the intersection of Darnestown Road (MD 28) and Bucklodge Road (MD 117), in Boyds, Maryland. The LOD is surrounded by agricultural land to the north, south, and west, and forested area to the east. A stream is located just east and northeast of the LOD. Residences on large tracts of land are in the surrounding areas. Based on historical aerial and topographic maps, Darnestown Road and Bucklodge Road have been present since at least 1944 and the LOD has never been developed; however, it has been part of agricultural property. The surrounding area has been similar to its current configuration since 1959. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4354	<p>The LOD is located west of the intersection of Darnestown Road (MD 28) and Bucklodge Road (MD 117), in Boyds, Maryland. The LOD is surrounded by agricultural land to the north, south, and west, and forested area and stream to the east. A farm is located further to the south. Based on historical aerial and topographic maps, no substantial changes to the LOD and surrounding area have occurred since at least 1959. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4355	<p>The LOD is located along the north side of Darnestown Road (MD 28), northwest of and Bucklodge Road (MD 117), in Poolesville, Maryland. The surrounding area is primarily agricultural land. Two residences are located to the north. Based on historical aerial and topographic maps, the LOD has never been developed; however, it has been part of agricultural property. The surrounding area has been similar to its current configuration since 2006, when one of the residential structures currently present to the north was constructed. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4356	<p>The LOD is located along the south side of Darnestown Road (MD 28), northwest of Bucklodge Road, in Poolesville, Maryland. The LOD is surrounded by agricultural land. A farm is located to the northwest of the LOD. Based on historical aerial and topographic maps, no substantial changes to the LOD and surrounding area have occurred since at least 1959. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4361	<p>The LOD is located along the south side of Darnestown Road (MD 28), southeast of Cattail Road, in Poolesville, Maryland. The surrounding area is primarily agricultural land. A stream is located just west of the LOD. The NFF Stables is located to the northwest of the LOD. Based on historical imagery, the surrounding area has been developed primarily as agricultural land since at least 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4362	<p>The LOD is located along the north side of Darnestown Road (MD 28), southeast of Cattail Road, in Poolesville, Maryland. The LOD is surrounded by agricultural land. A stream is located just west of the LOD. The NFF Stables is located to the northwest of the LOD. Based on historical imagery, the surrounding area has been developed primarily as agricultural land since at least 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4363	<p>The LOD is located along the north side of Darnestown Road (MD 28), southeast of Cattail Road, in Poolesville, Maryland. The surrounding area is primarily agricultural land. The NFF Stables is located to the north of the LOD. A stream is located just east of the LOD, along with a farm to the north. Based on historical imagery, the surrounding area has been developed primarily as agricultural land since at least 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4364	<p>The LOD is located along and south of Darnestown Road (MD 28), southeast of Cattail Road, in Poolesville, Maryland. The surrounding area is primarily agricultural land. The NFF Stables is located to the north of the LOD. A stream is located east of the LOD. Based on historical imagery, the surrounding area has been developed primarily as agricultural land since at least 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4366	<p>The LOD is located along the south side of Darnestown Road (MD 28), southeast of Cattail Road, in Poolesville, Maryland. The surrounding area is primarily agricultural land. Structures/ farms are located to the north and south. Based on historical imagery, the surrounding area has been developed primarily as agricultural land since at least 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4370	<p>The LOD is located along the south side of Darnestown Road (MD 28), west of Peach Tree Road, in Poolesville, Maryland. The remainder of the surrounding area is a mixture of agricultural and forest land. A nursery is located to the north and farm/commercial facility to the southeast. Based on historical imagery, no substantial changes to the surrounding area were observed since 1944, with the exception of the nursery and farm/commercial structure that were first observed in the 1993 aerial photographs. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4371	<p>The LOD is located south of Darnestown Road (MD 28), west of Peach Tree Road, in Poolesville, Maryland. The remainder of the surrounding area is a mixture of agricultural and forested land. A nursery is located to the north and farm/commercial facility to the southeast. Based on historical imagery, no substantial changes to the surrounding area were observed since 1944, with the exception of the nursery and farm/commercial structure that were first observed in the 1993 aerial photographs. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4373	<p>The LOD is located along the northern side of Darnestown Road (MD 28), east of Jerusalem Road, in Poolesville, Maryland. The surrounding area is primarily agricultural and forested land, with several residential structures located to the north/northeast and south. Based on historical imagery, the surrounding area has been agricultural land since at least the 1940s. One record of concern, a site approximately 290 feet northeast of the LOD, previously had a 10,000-gallon gasoline UST. According to records provided by MDE, the UST was excavated and removed from the site in June 1994. The onsite MDE inspector screened excavated soils, as well as the floor of the excavation with a PID. No indications that a release had occurred were observed during the removal of the tank. The MDE inspector instructed the contractor to backfill the excavation, and the OCP case was subsequently closed approximately 1 year later. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4375	<p>The LOD is located along the south side of Darnestown Road (MD 28), northwest of Peach Tree Road, in Poolesville, Maryland. The LOD is surrounded by residential, agricultural, and forested land. Dry Seneca Creek is to then northwest of the LOD. Based on historical aerial and topographic maps, the surrounding area has been primarily agricultural and forest land since 1944. The farm to the north was observed to have been developed around 1971. The surrounding area was observed to be developed in its current configuration around 1993. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4376	<p>The LOD is located along the south side of Darnestown Road (MD 28), southeast of Beallsville Road, in Beallsville, Maryland. The LOD is surrounded by residential, agricultural, and forested land. The Four Streams Golf Course is located northeast of the LOD. Based on historical aerial and topographic maps, the surrounding area has been primarily agricultural and forest land since 1944. The farm to the south was observed to have been developed around 1971. The surrounding area was observed to be developed in its current configuration around 2005. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

The LOD is surrounded by residential, agricultural, and forest land. Based on historical imagery the surrounding area has been primarily agricultural and forested land since 1959. Residential development to the south and further to the north was observed around 1963 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4391	<p>The LOD is located along the west side of Darnestown Road (MD 28), southeast of Bucklodge Road (MD 117), in Boyds, Maryland. The LOD is surrounded by agricultural land to the south and west, and forested area to the north and east. A stream is present just west of the LOD. Residences on large tracts of land are in the surrounding areas. Based on historical aerial and topographic maps, no substantial changes have been observed to the surrounding area since approximately 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4392	<p>The LOD is located along the east side of Darnestown Road, southeast of Bucklodge Road, in Boyds, Maryland. The LOD is surrounded by agricultural land to the south and west, and forested area to the north and east. A stream is present just west of the LOD. Residences on large tracts of land are in the surrounding areas. Based on historical aerial and topographic maps, no substantial changes have been observed to the surrounding area since approximately 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4393	<p>The LOD is located along the northeast side of Darnestown Road (MD 28), northwest of White Ground Road, in Boyds, Maryland. The LOD is surrounded by agricultural properties. Based on historical aerial and topographic maps, no substantial changes have been observed to the surrounding area since approximately 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4394	<p>The LOD is located along the southwest side of Darnestown Road (MD 28), northwest of White Ground Road, in Boyds, Maryland. . The LOD is surrounded by agricultural properties. Based on historical aerial and topographic maps, no substantial changes have been observed to the surrounding area since approximately 1944. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4397	<p>The LOD is located along the northeast side of Darnestown Road (MD 28), north of White Ground Road, in Boyds, Maryland. The LOD is surrounded by agricultural land and two residential properties to the west and southwest. Based on historical aerial and topographic maps, Darnestown Road has been present since at least 1944. Based on the 1959 aerial photograph, the LOD and surrounding area are agricultural land. Residences in the immediate area were observed to be present around 1981, when the surrounding area was observed to be developed in its current configuration. Two environmental database listings were identified in the immediate area of the LOD. The first database listing is related to a petroleum release that occurred approximately 400 feet to the north (upgradient) in 1994 and was closed the same day. The second environmental database listing is associated with a service station to the south of the LOD. The service station has five former USTs registered to it that were excavated and removed from the site in 1989 (4 USTs) and 1994 (1 UST). OCP cases were opened for both of the UST removals; however, available records do not state whether impacted materials were encountered during the closures of the UST, or whether cleanup/ remediation was required. Based on a review of historical imagery, the former USTs were located approximately 205 feet south (downgradient) of the LOD. Thus, impacts to the LOD are unlikely based on distance.</p>
WAS-4402	<p>The LOD is located along Whites Ferry Road (MD 107), west of Morrow Road, in Poolesville, Maryland. The LOD is surrounded by agricultural and forested land. A residential property is present to the northwest. Based on historical aerial and topographic maps, Whites Ferry Road has been present since at least 1944. Based on the 1959 aerial photograph, the LOD and surrounding area are agricultural in use. Residential development was observed in the 1994 aerial photograph, in which the LOD and surrounding area are similar to current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4404	<p>The LOD is located along the north side of Whites Ferry Road (MD 107), west of Morrow Road in Poolesville, Maryland. The LOD is surrounded by agricultural and forested land. Based on historical aerial and topographic maps the surrounding area has been developed as agricultural land since approximately 1959. Residential development was observed further to the east in 1994, when the surrounding area was observed to be developed similar to its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4405	<p>The LOD is located along the north side of Whites Ferry Road (MD 107), west of Morrow Road, in Poolesville, Maryland. The LOD is surrounded by agricultural and forested land. Based on historical aerial and topographic maps, Whites Ferry Road has been present since at least 1944. The surrounding area has been primarily agricultural land since at least 1959. Residential development was observed to begin around 1994 further to the east and southeast. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4406	<p>The LOD is located along the north side of Whites Ferry Road (MD 107), east of Morrow Road, in Poolesville, Maryland. The LOD is surrounded by agricultural land to the east and forested land to the west. A commercial property is located to the south of the LOD. Based on historical aerial and topographic maps, Whites Ferry Road has been present since at least 1944. Residential development was observed to have occurred around 1994, when the surrounding area is observed to be developed similar to its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4407	<p>The LOD is located along the south side of Whites Ferry Road (MD 107), east of Morrow Road, in Poolesville, Maryland. The LOD is surrounded by agricultural land to the east and forested land to the west. A commercial property is located to the south of the LOD. Based on historical aerial and topographic maps, Whites Ferry Road has been present since at least 1944. Residential development was observed to have occurred around 1994, when the surrounding area is observed to be developed similar to its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4411	<p>The LOD is located along the south side of Whites Ferry Road (MD 107), west of Sugarland Road, in Darnestown, Maryland. The LOD is surrounded by agricultural and forested land to the north, south, and west. Residential properties are observed to the east. A residential property is directly south of the LOD. Based on historical aerial and topographic maps, Whites Ferry Road has been present since at least 1944 and the surrounding area was primarily agricultural land up until 2005, which residential development was observed to the east. One environmental database listing was identified in the immediate area of the LOD. A sod farm is located approximately 455 feet to the west of LOD, and is believed to be hydraulically cross-gradient. Two permanently out of use USTs were removed on 8/28/1989. One was a 2,000-gallon diesel UST; however, no information is available for the second UST. Impacts to the LOD are believed to be unlikely, based on the absence of reported releases and the site's crossgradient proximity relative to the LOD.</p>
WAS-4412	<p>The LOD is located north side of Whites Ferry Road (MD 107), west of Sugarland Road, in Darnestown, Maryland. WAS-4413	<p>The LOD is located along the north side of Whites Ferry Road (MD 107), west of the intersection with Darnestown Road (MD 28), in Boyds, Maryland. Residential properties are present to the west, south, and southeast. Agricultural fields are present to the northeast. Based on historical aerial and topographic maps, the surrounding area has been developed similar to its current configuration since at least 1959. One environmental database listing was identified approximately 70 feet to the east of the LOD. According to available records, a release of approximately 10-gallons of lube oil occurred at Darnestown Road and Whites Ferry Road in April 2017, due to a motor vehicle accident. The spill was contained and removed. Based on gradient, quantity of the spill and removal activities, impacts to LOD are unlikely.</p>
WAS-4414	<p>The LOD is located along the south side of Whites Ferry Road (MD 107), west of the intersection with Darnestown Road (MD 28), in Boyds, Maryland. Residential properties are present to the west, south, and southeast. Agricultural fields are present to the northeast. Based on historical aerial and topographic maps, the surrounding area has been developed similar to its current configuration since at least 1959. One environmental database listing was identified approximately 75 feet to the east of the LOD. According to available records, a release of approximately 10-gallons of lube oil occurred at Darnestown Road and Whites Ferry Road in April 2017, due to a motor vehicle accident. The spill was contained and removed. Based on gradient, quantity of the spill and removal activities, impacts to LOD are unlikely.</p>
WAS-4415	<p>The LOD is located along the north side of Darnestown Road (MD 28), at the intersection with Whites Ferry Road (MD 107), in Boyds, Maryland. Residential properties are present to the west, south, and southeast. Agricultural fields are present to the northeast. Based on historical aerial and topographic maps, the surrounding area has been developed similar to its current configuration since at least 1959. One environmental database listing was identified approximately 35 feet to the east of the LOD. According to available records, a release of approximately 10-gallons of lube oil occurred at Darnestown Road and Whites Ferry Road in April 2017, due to a motor vehicle accident. The spill was contained and removed. The release is believed to have occurred downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4423	<p>The LOD is located along the south side of Darnestown Road (MD 28), west of Bellingham Drive, in Darnestown, Maryland. The LOD is surrounded by forests to the north, residential to the east, and agricultural land to the south and west. Based on historical aerial and topographic maps, the surrounding area has been a mixture of agricultural, forested, and residential properties since the 1940s. A farm has been present to the southwest since the early 1940s as well. Several residential structures to the northwest and northeast are observed to be present around 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

WAS-4424	<p>The LOD is located along the northern side of Darnestown Road (MD 28), west of Bellingham Drive, in Darnestown, Maryland. The LOD is surrounded by forests and residential properties to the north, residential properties to the east, and agricultural land to the south and west. Based on historical aerial and topographic maps, the surrounding area has been a mixture of agricultural, forested, and residential properties since the 1940s. A farm has been present to the southwest since the early 1940s as well. Several residential structures to the northwest and northeast are observed to be present around 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4425	<p>The LOD is located along the southern side of Darnestown Road (MD 28), west of Bellingham Drive, in Darnestown, Maryland. The LOD is surrounded by forests and residential properties to the north, residential properties to the east, and agricultural land to the south and west. Based on historical aerial and topographic maps, the surrounding area has been a mixture of agricultural, forested, and residential properties since the 1940s. A farm has been present to the southwest since the early 1940s as well. Several residential structures to the northwest and northeast are observed to be present around 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4426	<p>The LOD is located along the northern side of Darnestown Road (MD 28), immediately east of Bellingham Drive, in Darnestown, Maryland. The LOD is surrounded by forests and residential properties to the north, residential properties to the east, and agricultural land to the south and west. Based on historical aerial and topographic maps, the surrounding area has been a mixture of agricultural, forested, and residential properties since the 1940s. Several residential structures to the northwest and northeast are observed to be present around 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4427	<p>The LOD is located along the southern side of Darnestown Road (MD 28), west of Black Rock Road, in Darnestown, Maryland. Agricultural land is observed to the north, east, and west. Forested land and residential properties are observed to the south. Based on historical aerial and topographic maps, the surrounding area was relatively unchanged up until 2005, when residential development to the south and northwest was observed to have occurred. Residential development continued through 2015, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified during this environmental review.</p>
WAS-4428	<p>The LOD is located along the southern side of Darnestown Road (MD 28), east of Black Rock Road, in Darnestown, Maryland. The LOD is surrounded by residential properties on medium tracks of land. Based on historical aerial and topographic maps, the surrounding area was primarily agricultural and forested land from at least the 1940's through the 1980's, when residential development began. Residential development continued through 2015, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4429	<p>The LOD is located along the northern side of Darnestown Road (MD 28), immediately east of Berryville Road, in Darnestown, Maryland. The LOD is surrounded by residential properties on large tracks of land. Based on historical aerial and topographic maps, the surrounding area was primarily agricultural and forested land from at least the 1940's through the 1980's, when residential development began. Residential development continued through 2015, when the surrounding area was observed to be developed in its current configuration. Two OCP cases were identified in the vicinity of the LOD. The first case, is associated with property approximately 250 feet north of the LOD, involved a release motor/lube oil from an AST. The release most likely surficial in nature, the material was addressed and the case was closed approximately two months later. The second case is associated with a site approximately 580 feet southeast (downgradient) from the LOD and was open and closed the same day it was opened (12/1/1995). No other info was available. Based on the proximity of the sites relative to the LOD, impacts to the LOD is unlikely.</p>
WAS-4431	<p>The LOD is located along the southern side of Darnestown Road (MD 28), immediately east of Berryville Road, in Darnestown, Maryland. The LOD is surrounded by residential properties on large tracks of land. WAS-4441	<p>The LOD is located along the north side of Barnesville Road (MD 117), southeast of Slidell Road, in Boyds, Maryland. The LOD is surrounded by residential properties on large tracts of land and agricultural property. A railroad is located to the south. Based on historical aerial and topographic maps the surrounding area appeared to be primarily agricultural properties, with residences to the north and south up until residential development began to occur. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4442	<p>The LOD is located along the western side of Barnesville Road (MD 117), north of Ganley Road, in Boyds, Maryland. The surrounding area consists of low-density residential development which replaced agricultural uses in the late 1990's/early 2000's. Prior to residential development, the surrounding area was used for agricultural purposes since at least 1959. No records of concern were identified during this environmental review.</p>
WAS-4443	<p>The LOD is located along the eastern side of Barnesville Road (MD 117), north of Ganley Road, in Boyds, Maryland. The surrounding area consists of low-density residential development which replaced agricultural uses in the late 1990's/early 2000's. Prior to residential development, the surrounding area was used for agricultural purposes since at least 1959. No records of concern were identified during this environmental review.</p>
WAS-4444	<p>The LOD is located along the western side of Barnesville Road (MD 117), north of Ganley Road, in Boyds, Maryland. The surrounding area consists of low-density residential development which replaced agricultural uses in the late 1990's/early 2000's. Prior to residential development, the surrounding area was used for agricultural purposes since at least 1959. A SPILLS incident, occurring 420 feet upgradient from the LOD, involved the release of an unknown quantity of #2 heating oil from a residential heating oil AST. A magnetic patch was applied until the tank could be emptied. The site is believed to upgradient to the LOD; however; based on the distance of this incident, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4445	<p>The LOD is located along the eastern side of Barnesville Road (MD 117), north of Ganley Road, in Boyds, Maryland. The surrounding area consists of low-density residential development which replaced agricultural uses in the late 1990's/early 2000's. Prior to residential development, the surrounding area was used for agricultural purposes since at least 1959. A SPILLS incident, occurring 420 feet south of the LOD, involved the release of an unknown quantity of #2 heating oil from a residential heating oil AST. A magnetic patch was applied until the tank could be emptied. The site is believed to upgradient to the LOD; however, based on the distance of this incident, impacts to the LOD are unlikely</p>
WAS-4446	<p>The LOD is located along the western side of Barnesville Road (MD 117), south of Ganley Road, in Boyds, Maryland. The surrounding area consists of low-density residential development which replaced agricultural uses in the late 1950's through 1970's. Two SPILLS incidents were identified in the immediate vicinity of the LOD. The first incident, occurring 330 feet from the LOD, involved the release of approximately one quart of heating oil due to human error while refilling a residential heating oil tank. The spill was cleaned up with absorbent pads and wash water. The second incident, occurring 420 feet upgradient from the LOD, involved the release of an unknown quantity of #2 heating oil from a residential heating oil AST. A magnetic patch was applied until the tank could be emptied. Both releases are believed to be surficial in nature. Thus, impacts to the LOD are unlikely based on the distances of these incidents.</p>
WAS-4447	<p>The LOD is located along the eastern side of Barnesville Road (MD 117), between Clarksburg Road and Ganley Road, in Boyds, Maryland. The surrounding area consists of low-density development, including both commercial and residential uses, mostly developed prior to 1908; the area is a historic district. Little Seneca Lake is located to the east. OCP/UST/SPILLS cases were identified at distances ranging between 165 and 605 feet from the LOD. The most significant of these, a US Post Office located 165 feet to the west, was listed on the UST, OCP and SPILLS databases. In 1999, a 550-gallon steel heating oil tank was removed and replaced with a new 500-gallon double-walled steel UST. Three small (1/8") perforations were identified on the bottom of the old UST. Two soil samples were collected. A grab sample from the bottom contained 117 mg/Kg TPH-DRO, while a composite collected from stockpiled soils was non-detect. The detected TPH-DRO concentration beneath the former UST was below the residential soil cleanup standard, and MDE closed the OCP case. A minor spill of approximately 1.5-gallons occurred in 2014 during product transfer activities. Groundwater contouring data obtained for the Boyds Country Store site, located 605 feet from the LOD and also on the UST and OCP databases, identifies the groundwater flowing is in a southwesterly direction, away from the LOD. Based on this groundwater flow direction, the US Post Office is downgradient of the LOD, while all other listed sites are crossgradient. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4448	<p>The LOD is located along the western side of Barnesville Road (MD 117), between Clarksburg Road and Ganley Road, in Boyds, Maryland. The northern portion of the LOD extends westerly, across Barnesville Road. The surrounding area consists of low-density development, including both commercial and residential uses, mostly developed prior to 1908; the area is a historic district. Little Seneca Lake is located to the east. OCP/UST/SPILLS cases were identified at distances ranging between 300 and 640 feet from the LOD. The most significant of these, the Boyds Country Store located 385 feet to the southeast, has known groundwater impacts present, primarily MTBE. Groundwater contouring at this site depicts the groundwater as flowing southwesterly, away from the LOD. Based on this groundwater flow direction, all listed UST/OCP/SPILL incidents are believed to be located hydraulically crossgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4449	<p>The LOD is located along the eastern side of Barnesville Road (MD 117), between Clarksburg Road and Ganley Road, in Boyds, Maryland. The surrounding area consists of low-density development, including both commercial and residential uses, mostly developed prior to 1908; the area is a historic district. Little Seneca Lake is located to the east. OCP/UST/SPILLS cases were identified at distances ranging between 310 and 640 feet from the LOD. The most significant of these, the Boyds Country Store located 420 feet to the southeast, has known groundwater impacts present, primarily MTBE. Groundwater contouring at this site depicts the groundwater as flowing southwesterly, away from the LOD. Based on this groundwater flow direction, all listed UST/OCP/SPILL incidents are believed to be located hydraulically crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4450	<p>The LOD is an area near the northwest corner of Barnesville Road (MD 117) and Clarksburg Road (MD 121), in Boyds, Maryland. A portion of the LOD extends east across Clarksburg Road. Woodland is located to the north and east, followed by Little Seneca Lake; low-density residential and commercial structures followed by agricultural fields are to the southwest; and agricultural fields are to the to the southeast. The majority of the development occurred prior to 1908; the area is a historic district. Two OCP/UST sites cases were identified at distances of 215 feet and 335 feet to the west. The most significant of these two, a former auto repair facility (Dean's Garage) located 215 feet from the LOD, had two 1,000-gallon steel gasoline USTs removed in 1994. PID soil screening levels ranged between 10 and 36 ppm, which the MDE inspector allowed to be reused, if necessary. Two soil samples were collected, one from above the former USTs and one below, and analyzed for TPH, BTEX and MTBE. Concentrations of toluene, ethylbenzene and xylenes were detected, but at concentrations below the MDE's Residential Soil Cleanup Standards. MDE subsequently closed the OCP case on 6/29/94. Groundwater contouring data obtained for the Boyds Country Store site, located approximately 335 feet from the LOD and also on the UST and OCP databases, identifies groundwater flowing in a southwesterly direction, away from the LOD. Thus, impacts to the LOD from either the former garage or the Boyd's Country Store are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4451	<p>The LOD is an area near the southwest corner of the intersection of Barnesville Road (MD 117) and Clarksburg Road (MD 121), in Boyds, Maryland. A portion of the LOD extends east across Clarksburg Road. Woodland followed by Little Seneca Lake are located to the north and east; low-density residential and commercial structures followed by agricultural fields to the southwest; and agricultural fields are to the to the southeast. The majority of the development occurred prior to 1908; the area is a historic district. Two OCP/UST sites cases were identified at distances of 200 feet and 325 feet to the west. The most significant of these two, a former auto repair facility (Dean's Garage) located 200 feet from the LOD, had two 1,000-gallon steel gasoline USTs removed in 1994. PID soil screening levels ranged between 10 and 36 ppm, which the MDE inspector allowed to be reused, if necessary. Two soil samples were collected, one from above the former USTs and one below, and analyzed for TPH, BTEX and MTBE. Concentrations of toluene, ethylbenzene and xylenes were detected, but at concentrations below the MDE's Residential Soil Cleanup Standards. MDE subsequently closed the OCP case on 6/29/94. Groundwater contouring data obtained for the Boyds Country Store site, located 325 feet from the LOD and also on the UST and OCP databases, identifies groundwater flowing in a southwesterly direction, away from the LOD. Thus, impacts to the LOD from either the former garage or the Boyd's Country Store are unlikely.</p>
WAS-4452	<p>The LOD is located along Clopper Road (MD 117), east of White Ground Road, in Boyds, Maryland. The LOD contains a portion of Clopper Road, an adjacent grassy strip with a few trees to the south, and a small portion extends north across the street, and abuts the auto repair shop. North of the LOD and repair shop is railroad and Little Seneca Lake. Undeveloped fields are located to the south. The site abuts a vehicle storage and repair facility with documented releases and former USTs. An 8,000-gallon diesel #2 UST and 8,000-gallon regular diesel UST were excavated and removed from the site in 1994. No staining or odors were observed in the excavation. PID readings from the two excavations ranged from 0.0 ppm to 4.6 ppm. Based on the lack of release, the case received closure from MDE in 1995. The USTs are believed to be at least 100 feet north (downgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4453	<p>The LOD is located along the southern side of Clopper Road (MD 117), across the street from 14627 Clopper Road, in Boyds, Maryland. Residential structures, a lumber mill, railroad tracks and Little Seneca Lake are located along the northern side of Clopper Road, while agricultural land is located on the southern side. Clopper Road and the railroad have existed since the early 1900's. In the 1950's the area was cleared for agricultural use, and in the 1980's Little Seneca Lake was constructed. An OCP case and an ERNS cases were identified; however, these incidents were determined to have occurred at distances of 775 feet and 635 feet from the LOD, respectively. Based on these distances, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4454	<p>The LOD is located along the northern side of Clopper Road (MD 117), adjacent to 14627 Clopper Road, in Boyds, Maryland. Residential structures, a lumber mill, railroad tracks and Little Seneca Lake are located along the northern side of Clopper Road, while agricultural land is located on the southern side. Clopper Road and the railroad have existed since the early 1900's. In the 1950's the area was cleared for agricultural use, and in the 1980's Little Seneca Lake was constructed. An OCP case and an ERNS cases were identified; however, these incidents were determined to have occurred at distances of 845 feet and 730 feet from the LOD, respectively. Based on these distances, impacts to the LOD are unlikely.</p>
WAS-4455	<p>The LOD is located along the southern side of Clopper Road (MD 117), between 14627 and 14601 Clopper Road, in Boyds, Maryland. The western portion of the LOD extends north, across Clopper Road. Residential structures, a lumber mill, railroad tracks and Little Seneca Lake are located along the northern side of Clopper Road, while agricultural land is located on the southern side. Clopper Road and the railroad have existed since the early 1900's. In the 1950's the area was cleared for agricultural use, and in the 1980's Little Seneca Lake was constructed. A facility listed on the OCP and RCRA CESQG databases was identified; however, this facility was determined to be located approximately 1,000 feet from the LOD. Based on this distance, impacts to the LOD are unlikely.</p>
WAS-4456	<p>The LOD is located along the eastern side of Clarksburg Road (MD 121), north of Barnesville Road (MD 117), in Boyds, Maryland. Forested land followed by Little Seneca Lake are located to the north and east; low-density residential and commercial structures followed by agricultural fields to the southwest; and agricultural fields are to the south. The majority of the development occurred prior to 1908; the area is a historic district. Two OCP/UST sites cases were identified at distances of 425 feet and 535 feet to the west. The closest of these, a former auto repair facility (Dean's Garage) located 425 feet from the LOD, had two 1,000-gallon steel gasoline USTs removed in 1994. PID soil screening levels ranged between 10 and 36 ppm, which the MDE inspector allowed to be reused, if necessary. Two soil samples were collected, one from above the former USTs and one below, and analyzed for TPH, BTEX and MTBE. Concentrations of toluene, ethylbenzene and xylenes were detected, but at concentrations below the MDE's Residential Soil Cleanup Standards. MDE subsequently closed the OCP case on 6/29/94. Groundwater contouring data obtained for the Boyds Country Store site, located 535 feet from the LOD and also on the UST and OCP databases, identifies groundwater flowing in a southwesterly direction, away from the LOD. Thus, impacts to the LOD from either the former garage or the Boyd's Country Store are unlikely.</p>
WAS-4457	<p>The LOD is located on the eastern side of Clarksburg Road (MD 121), just south of the bridge over Little Lake Seneca, in Boyds, Maryland. The LOD and surrounding area were used for agricultural land from at least 1959 until Little Lake Seneca was created in 1984. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4459	<p>The LOD is located in the western side of Clarksburg Road (MD 121), immediately north of Ridge Oak Drive, in Boyds, Maryland. A portion of LOD extends south across Ridge Oak Drive to Little Seneca Lake. Residential structures are located to the north and west, wooded areas to the east, and the reservoir to the south. The area was agricultural land from at least 1959 until Little Seneca Lake was created in 1984. No records of concern were identified during this environmental review.</p>
WAS-4462	<p>The LOD is located on the western side of Clarksburg Road (MD 121), south of Top Ridge Drive, in Boyds, Maryland. A residential area, developed in the 1970's through 1990's, is located on the west side of Clarksburg Road, while an open area is to the east. Little Seneca Lake is located to the south, but also further to the east and west. The area was agricultural land from at least 1959 until Little Seneca Lake was created in 1984. No records of concern were identified during this environmental review.</p>
WAS-4463	<p>The LOD is located on the western side of Clarksburg Road (MD 121), immediately north of Top Ridge Drive, in Boyds, Maryland. The surrounding area consists of low-density residential development, which occurred in the early 1990's. The nearby Little Seneca Lake was created in 1984. The area was agricultural land from at least 1959 until Little Seneca Lake was created in 1984. No records of concern were identified during this environmental review.</p>
WAS-4464	<p>The LOD is located on the eastern side of Clarksburg Road (MD 121), immediately north of Ascot Square Court, in Boyds, Maryland. The surrounding area consists of low-density residential development, which occurred in the early 1990's to the northwest, and during the 1990's and 2000's to the east and southwest. The nearby Little Seneca Lake was created in 1984. The area was agricultural land from at least 1959 until Little Seneca Lake was created in 1984. No records of concern were identified during this environmental review.</p>

LOD ID	<div>Low Risk LOD Table</div> <div>Ranking Rationales</div>
WAS-4474	<p>The LOD is located along the east side of Frederick Road (MD 355), south of Middlebrook Road, in Germantown, Maryland. The majority of the LOD is located along the east side of the northbound lane of N. Frederick Road and the remaining portion is in the adjacent landscaped area of a commercial center. The LOD is surrounded by commercial properties. The Germantown East Local Park is located to the northwest. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944 and commercial development in the surrounding area was observed to start around 1993. By 2017, the surrounding area was observed to developed in its current configuration. A gas station was located approximately 100 feet northeast (crossgradient) from the LOD up until 2007. The structure itself was demolished 2015, and redeveloped as an urgent care center. During the closure of the gas station in April 2007, the three 12,000-gallon gasoline USTs, as well as the ancillary equipment onsite including the product lines, sump/vapor recovery systems, and dispenser islands were excavated and removed from the site. No substantial subsurface impacts were encountered during the removal of the USTs. Only low-level concentrations of toluene and MTBE below MDE action levels were detected in soil samples from the excavated areas around the USTs and ancillary equipment. Benzene, ethylbenzene, xylenes, TPH-GRO, TPH-DRO were all non-detect. Additionally, PID readings from the floors of the excavated areas, as well as removed soils ranged from 0 ppm to 9.2 ppm. It is believed that that gas station did not impact subsurface material in the surrounding area based on the analytical results of the confirmation sampling conducted during the closure of the USTs and ancillary equipment. The remaining four environmental database listings are unlikely to impact the LOD as they either have no violations, no releases, or are believed to be located downgradient or crossgradient. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4475	<p>The LOD is located along the west side of Frederick Road 9MD 355), south of the Middlebrook Road, in Germantown, Maryland. The LOD is surrounded by commercial properties. The Germantown East Local Park is located to the north. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944 and commercial development in the surrounding area was observed by 1993 with the development a gas station to the east in 2005 that was demolished in 2015. The LOD and surrounding area are similar to their current configuration by 2017. Eleven environmental database listings were identified in the immediate area of the LOD, including a closed Exxon gas station 330 feet to the northeast (upgradient), 7-Eleven gas station 185 feet to the southwest, and a Sunoco (formerly Amoco) gas station 310 feet further to the southwest (crossgradient). The former Exxon station to the northeast was present up until 2007 when it closed. The facility was demolished and an urgent care facility was constructed in its place around 2015. During the closure of the gas station in April 2007, the three 12,000-gallon gasoline USTs, as well as the ancillary equipment onsite including the product lines, sump/vapor recovery systems, and dispenser islands were excavated and removed from the site. No substantial subsurface impacts were encountered during the removal of the USTs. Only low-level concentrations of toluene and MTBE were detected in soil samples from the excavated areas around the USTs and ancillary equipment. Benzene, ethylbenzene, xylenes, TPH-GRO, TPH-DRO were all non-detect. Additionally, PID readings from the floors of the excavated areas, as well as removed soils ranged from 0 ppm to 9.2 ppm. It is believed that that gas station did not impact subsurface material in the surrounding area based on the analytical results of the confirmation sampling conducted during the closure of the USTs and ancillary equipment. The remaining four environmental database listings are unlikely to impact the LOD as they either have no violations, no releases, or are located downgradient. Based on a review of the two gas stations southwest (crossgradient) of the LOD. Impacted soil and groundwater was previously identified at both sites; however, based on a review of analytical sampling data and the groundwater elevation data, impacts are believed to be isolated to the gas station properties or to the southwest of the LOD. Thus, impacts are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4476	<p>The LOD is located along the west side of Frederick Road (MD 355), south of the Middlebrook Road, in Germantown, Maryland. The LOD is surrounded by commercial properties. Based on review of historical aerial and topographic maps, N. The former Exxon station to the northeast was present up until 2007 when it closed. The facility was demolished and an urgent care facility was constructed in its place around 2015. During the closure of the gas station in April 2007, the three 12,000-gallon gasoline USTs, as well as the ancillary equipment onsite including the product lines, sump/vapor recovery systems, and dispenser islands were excavated and removed from the site. No substantial subsurface impacts were encountered during the removal of the USTs. Only low-level concentrations of toluene and MTBE were detected in soil samples from the excavated areas around the USTs and ancillary equipment. Benzene, ethylbenzene, xylenes, TPH-GRO, TPH-DRO were all non-detect. It is believed that that gas station did not impact subsurface material in the surrounding area based on the analytical results of the confirmation sampling conducted during the closure of the USTs and ancillary equipment. The remaining four environmental database listings are unlikely to impact the LOD as they either have no violations, no releases, or are located downgradient. Based on a review of the two gas stations southwest (crossgradient) of the LOD. The 7-Eleven gas station approximately 185 feet to the southeast currently has two gasoline USTs (10,000 gallons and 15,000 gallons) that were installed on 9/1/2001. The Sunoco (formerly Amoco) approximately 310 feet to the southeast, currently has four 10,000 gallon USTs. Impacted soil and groundwater was previously identified at both sites; however, based on a review of analytical sampling data and the groundwater elevation data, impacts are believed to be isolated to the gas station properties or to the southwest of the LOD. Thus, impacts are unlikely.</p>
WAS-4477	<p>The LOD is located along the west side N. Frederick Road (MD 355), north of the Christopher Avenue, in Gaithersburg, Maryland. The LOD is located in the western most southbound lane and the vegetated area adjacent of the roadway. The surrounding area is primarily developed with commercial properties. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. The surrounding area was primarily agricultural land up until the 1960s, when commercial development began. Development continued up until approximately 2005, when the surrounding area was observed to be developed in its current configuration. Nine sites were identified in the environmental database report, near the LOD that include four car dealerships, two automotive shops, and two defense contractor office facilities. There are four OCP cases that are in close proximity to the LOD (three car dealership and the IBM Corporation). Based on a review of available information on these site's and OCP cases provided by MDE through a PIA request, no substantial releases have occurred on the properties, that are believed to have impacted the LOD. The remaining five environmental database listings are unlikely to impact the LOD based on their distance from the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4478	<p>The LOD is located along the east side of N. Frederick Road (MD 355), northwest of Montgomery Village Avenue (MD 124), in Gaithersburg, Maryland. The LOD consists of the easternmost northbound lane and the vegetated area adjacent to the roadway. The LOD is surrounded by commercial properties of the Lakeforest Auto Center. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. Based on review of the 1959 aerial, the LOD and surrounding areas were residential with agricultural land. Commercial development began by 1981 and continued until 2017 when the LOD and surrounding areas are similar to their current configuration. A Costco warehouse store abuts the LOD to the east and was identified as a RCRA SQG. Although no releases or violations were reported, the facility received an enforcement action in 2014 from a nation-wide compliance evaluation for a refrigerant-related issue. A Ford dealership was identified 560 feet to the northwest (downgradient) with two closed OCP cases. No details were provided for one case other than the open (1987) and closure (1991) dates. The other OCP case is for a compliance inspection in 2000; no releases or cleanup activities were reported. The dealership is also an active RCRA SQG facility with no reported violations. Two additional auto dealerships were identified approximately 375 feet away to the east (crossgradient). Both are RCRA SQG listings with no reported violations or releases. Based on gradient, distance, and/or absence of violations or releases, none of these listings are likely to impact the LOD.</p>
WAS-4479	<p>The LOD is located along the west side of N. Frederick Road (MD 355), northwest of Montgomery Village Avenue (MD 124), in Gaithersburg, Maryland. The LOD consists of the westernmost southbound lane and the vegetated area adjacent of the roadway. The LOD is surrounded by commercial properties of the Lakeforest Auto Center. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. The LOD and surrounding areas were primarily developed as agricultural land, with some farms and structures intermixed throughout up until approximately 1981, when commercial development began, and continued through 2012, when the surrounding area was observed to be developed similar to its current configuration. Four environmental database listings were identified in the immediate area of the LOD, including three car dealerships and computer company. A Ford dealership was identified approximately 650 feet to the northwest (downgradient) with two closed OCP cases. No details were provided for one case other than the open (1987) and closure (1991) dates. The other OCP case is for a compliance inspection in 2000; no releases or cleanup activities were reported. The dealership is also an active RCRA SQG facility with no reported violations. Two additional auto dealerships were identified approximately 550 feet to the east (cross-gradient). Both are RCRA SQG listings with no reported violations or releases. IBM Corporation is located approximately 640 feet to the west (downgradient) and is listed as having one closed OCP case due to a release from an AST, which was subsequently addressed and closed. The IBM facility also has active ASTs and is a registered SQG with no recorded violations. Based on gradient, distance, case status, and/or absence of violations or releases, none of these listings are likely to impact the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4481	<p>The LOD is located along the west side N. Frederick Road (MD 355), northwest of Montgomery Village Avenue (MD 124), in Gaithersburg, Maryland. The LOD consists of the westernmost southbound lane and the vegetated area adjacent to the roadway. The LOD is surrounded by commercial properties. Based on review of historical aerial and topographic maps, N. Frederick Road has been present since at least 1944. The LOD and surrounding areas were primarily developed as agricultural land, with some farms and structures intermixed throughout up until approximately 1981, when commercial development began, and continued through 2017, when the surrounding area was observed to be developed similar to its current configuration. Two auto dealerships were identified approximately 115 feet away to the northeast. A hotel was identified as minor air source, 490 feet to the east. A Sam's Club is located 530 feet to the southeast. No records of releases associated with these facilities were identified during this review, with the exception of a surficial release of approximately 30-gallons of vehicle fluids due to a vehicular accident at the Sam's Club. All four sites are believed to be either crossgradient or downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4482	<p>The LOD is located along the north side of Montgomery Village Avenue, northeast of northbound onramp to I-270, in Gaithersburg, Maryland. The LOD is surrounded by commercial properties. Based on review of historical aerial and topographic maps, Montgomery Village Avenue was an unimproved road in 1944, but was developed along with the interstate by 1959. Commercial development began around 1971 and continue through 1993, when the surrounding area was observed to be developed in its current configuration.. One environmental database listing was identified in the vicinity of the LOD. The Hilton Hotel is located approximately 300 feet to the southeast (crossgradient) with a closed OCP case due to a tank closure in 1998. A release and cleanup were reported. A second small spill (25 gallons) occurred at the hotel in 2015 due to a damaged hose on a trash truck and was cleaned up. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4483	<p>The LOD is located along the east side of Montgomery Village Avenue (MD 124), south of N. Frederick Avenue (MD 355), in Gaithersburg, Maryland. The LOD is located in the southern most eastbound lane and the vegetated area adjacent of the roadway. The LOD is surrounded by commercial properties to north, south, and east; I-270 to the west. Based on review of historical aerial and topographic maps, Montgomery Village Avenue was an unimproved road in 1944, but was developed along with the interstate by 1959. Commercial development was observed to have begun around 1971 and continued through 1993, when the surrounding area was observed to be developed in its current configuration. Two environmental database listings were identified in the immediate area of the LOD; however, one of the sites, a mall, was misplotted and is approximately 0.5 miles to the northeast. The second site is Sam's Club approximately 70 feet northeast of the LOD. The facility is listed as a RCRA-VSG, RCRA-TSD, as well as having a reported surficial release of approximately 30-gallons of vehicle fluids due to a vehicular accident that was addressed and cleaned up. Based on the local topography, the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4484	<p>The LOD is located along the east side of Montgomery Village Avenue (MD 124), south Russell Avenue, in Gaithersburg, Maryland. The LOD is located in the southern most eastbound lane and the vegetated area adjacent of the roadway. The LOD is surrounded by commercial properties to the north, east, and west and a drainage basin to the south. Based on review of historical aerial and topographic maps, Montgomery Village Avenue was developed by 1971. The surrounding area was observed to be developed in its current configuration around 1993. Four sites of concern were identified in the environmental database report. A PIA request was submitted for further information regarding an office building and a fire station with previous USTs and OCP cases located 330 feet to the northwest (upgradient) and 400 feet to north (crossgradient), respectively. Based on a review of information for the two sites, no substantial petroleum impacts to soil and/or groundwater are believed to be present. Based on the proximity of these sites relative to the LOD, impacts are believed to be unlikely.</p>
WAS-4486	<p>The LOD is located west of Montgomery Village (MD 124), northeast of Christopher Avenue, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4487	<p>The LOD is located along the western right-of-way along Montgomery Village Avenue (MD 124), southwest of Midcounty Highway, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4488	<p>The LOD is located along the central median along Montgomery Village Avenue (MD 124), southwest of Midcounty Highway, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4489	<p>The LOD is located along the central median of Montgomery Village Avenue (MD 124), south of Lake Shore Drive, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural through the 1970s. Residential development continued expanding through the early 1990s when the LOD and surrounding area were observed to be developed in their current configuration. One site with a former UST was identified to be approximately 840 feet northwest of the LOD, based on Montgomery County property records. According to available records, the UST was closed in-place in 2001. Based on the local topography, the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely</p>
WAS-4491	<p>The LOD is located along the central median of Midcounty Highway (MD 124), east of Montgomery Village Avenue, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. An apartment complex located 605 feet to the southwest, was listed on the UST and OCP databases. Two 20,000-gallon heating oil USTs were removed, one each in 1994 and 2018. Based on the distance of the site from the LOD, impacts are unlikely.</p>
WAS-4493	<p>The LOD is located along in a median between Midcounty Highway (MD 124) and Docena Drive, west of Pier Point Place, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4494	<p>The LOD is located along the north side of Midcounty Highway (MD 124), west of Goshen Road, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land through the late-1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4495	<p>The LOD is located proximate to the northwest corner of Midcounty Highway (MD 124) and Goshen Road, in Gaithersburg, Maryland. The surrounding area is primarily forested land and residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land as early as 1959. Residential development began in the 1970s and continued through the 2000s when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4497	<p>The LOD is located proximate to the southeast corner of Midcounty Highway (MD 124) and Goshen Road, in Gaithersburg, Maryland. The surrounding area is primarily forested land and residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land as early as 1959. Residential development began in the 1970s and continued through the 2000s when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4498	<p>The LOD is located along the central median of Midcounty Highway (MD 124), east of the intersection with Goshen Road, in Gaithersburg, Maryland. The western portion of the LOD extends south across Midcounty Highway. The surrounding area is primarily forested land and residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land as early as 1959. Residential development began in the 1970s and continued through the 2000s when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4499	<p>The LOD is located along the northern side of Midcounty Highway (MD 124), east of the intersection with Goshen Road, in Gaithersburg, Maryland. The surrounding area is primarily forested land and residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural land as early as 1959. Residential development began in the 1970s and continued through the 2000s when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4502	<p>The LOD is located along the northern side of Midcounty Highway (MD 124), east of Goshen Road, in Gaithersburg, Maryland. The surrounding area is primarily unimproved forested area and residential. A school is located to the south-southeast beyond a forested area. Based on a review of historical imagery, the LOD and surrounding area were observed to be forested and agricultural land through the 1990s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4506	<p>The LOD is located along the central median of Midcounty Highway (MD 124), immediately east of Hidden Forest Drive, in Gaithersburg, Maryland. The surrounding area is primarily forested area and residential. A school is located to the south beyond a forested area. Based on a review of historical imagery, the LOD and surrounding area were observed to be forested and agricultural land through the 1990s when residential development began. Residential development continued through 2006 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4509	<p>The LOD is located along northern side of Midcounty Highway (MD 124), northwest of Woodfield Road, in Gaithersburg, Maryland. The surrounding area is primarily residential and forested lands. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural through the 1980s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. One record of concern, an ERNS case associated with illegal dumping, was identified 610 feet north of the LOD. This site is believed to be downgradient of the LOD and is hydraulically separated by a stream (Whetstone Run). Thus, impacts to the LOD are unlikely.</p>
WAS-4513	<p>The LOD is located along the northern side of Midcounty Highway (MD 124), immediately southeast of the intersection of Woodfield Road, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural through the 1980s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4516	<p>The LOD is located along the southern side of Midcounty Highway (MD 124), southeast of the intersection of Saybrooke Oaks Boulevard, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4517	<p>The LOD is located within the central median of Midcounty Highway (MD 124), east of the intersection with Washington Grove Lane, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4518	<p>The LOD is located along the northern side of Midcounty Highway (MD 124), east of the intersection with Washington Grove Lane, in Gaithersburg, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4519	<p>The LOD is located along the northern side of Midcounty Highway (MD 124), west of Taunton Drive, in Gaithersburg, Maryland. The surrounding area is primarily residential. A middle school is located to the southeast. Based on a review of historical imagery, the LOD and surrounding area were observed as agricultural and forested land through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4521	<p>The LOD is located in the central median of Midcounty Highway, west of Taunton Drive, in Gaithersburg, Maryland. The surrounding area is primarily residential. A middle school is located to the southeast. Based on a review of historical imagery, the LOD and surrounding area were observed as agricultural and forested land through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified during this environmental review.</p>
WAS-4523	<p>The LOD is located along the central median of Midcounty Highway (MD 124), west of the intersection with Miller Fall Road, in Gaithersburg, Maryland. The surrounding area is primarily residential, with the exception of the Shady Grove Middle School located immediately south of the LOD. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural through the 1970s when residential development began. Residential development continued through 2005 when the LOD and surrounding area were observed to be developed in their current configuration. The adjacent school has an air emissions permit, with compliance activity noted in 2011; however, air emissions will not have an impact on the LOD. A SPILLS record and an OCP case were noted for residential properties located 375 feet and 480 feet southeast of the LOD, respectively. Impacted soils were identified at both residential property; however, both sites are believed to be downgradient of the LOD. Thus, impacts are unlikely.</p>
WAS-4532	<p>The LOD is located along the east side of N. Frederick Road (MD 355), northwest of Odendhal Avenue, in Gaithersburg, Maryland. The LOD is surrounded by commercial properties. The Lake Forest Mall is located to the northeast. Based on review of historical aerial and topographic maps, Frederick Road has been present since at least 1944. Commercial development was observed by 1971. The LOD and surrounding areas were observed to developed in their current configuration by 2005. Nine environmental database listings were identified in the immediate area of the LOD. Six of the sites were either gas stations, VCP sites, or had reported release and/or former USTs. A PIA request was submitted to MDE for further information on these sites. Based on a review of available information, the sites were determined to be hydraulically downgradient, crossgradient of the LOD or impacts were believed to be isolated to the site. Thus, it is believed that impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4534	<p>The LOD is located along the west side of N. Frederick Road (MD 355), south of Montgomery Avenue in Gaithersburg, Maryland. The LOD is surrounded by commercial properties to the north, south, and east and a cemetery to the west. The Lake Forest Mall is located to the north. Based on review of historical aerial and topographic maps, Frederick Road has been present since at least 1944. Commercial development was observed by 1971. The LOD and surrounding areas are similar to their current configuration by 1993. Eleven environmental database listings were identified in the immediate area of the LOD. Nine of these listings likely have no impact on the LOD based on no releases, no violations, or distance. The remaining two sites include a gas station approximately 225 feet downgradient of the LOD, as well as a Midas tire shop approximately 500 feet upgradient of the LOD. Based on a review of available information on the two sites provided by MDE through a PIA request, no substantial releases have occurred at either site and are not believed to have impacted the LOD.</p>
WAS-4601	<p>The LOD is located on the west side of Germantown Road (MD 118), north of Darnestown Road (MD 28), in Darnestown, Maryland. Private residences on large tracts of land, as well as a private school, are located to the east and north. The surrounding area was primarily agricultural land up until the 1980s, when residential development began to occur in the 1980s. By 2005, the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4602	<p>The LOD is located on the west side of Germantown Road, (MD 118), south of Pioneer Hills Drive, in Darnestown, Maryland. Private residences on large tracts of land, as well as a private school, are located to the east and south. The surrounding area was primarily agricultural land up until the 1980s, when residential development began to occur in the 1980s. By 2005, the LOD and surrounding area were observed to be developed in their current configuration. A release of an unknown amount of motor/lube oil from an AST occurred in 1998. The release was reportedly addressed and the case was closed several months later. The site is believed to be approximately 200 feet northwest (downgradient) of the LOD. Based on the site's distance to the LOD and downgradient location, as well as the case having received closure, no impacts are likely.</p>
WAS-4603	<p>The LOD is located along the south side of Darnestown Road (MD 28), southeast of Meadows Drive, in Darnestown, Maryland. Private residences on large tracts of land are interspersed between farm and agriculture properties. Residential properties are located north of the northwestern and west of the southwestern corners of the LOD. The surrounding area has been primarily developed with agricultural and residential properties with the early 1900s. Additional residential development to the west continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4604	<p>The LOD is located along the south side of Darnestown Road (MD 28), southeast of Spring Meadows Drive, in Darnestown, Maryland. Private residences on large tracts of land are interspersed between farm/agriculture properties. Private residences are located to the northeast and further to the west of the LOD. The surrounding area has been primarily developed with agricultural and residential properties since the 1900s. The surrounding area was observed to be developed in its current configuration around 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4607	<p>The LOD is located off the south side of Darnestown Road (MD 28), southwest of Country Glen Court, in Darnestown, Maryland. Residential houses and open space abut the property in all directions. Development began in the early 1940s and continued up until 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4609	<p>The LOD is located along the south side of Darnestown Road (MD 28), west of Eden Rock Court, in Germantown, Maryland. Residential properties are located to the north and west. A church/private school are located to the southwest. Commercial properties, including a drycleaner, commercial businesses, bank, and grocery store, are located to the southeast. The surrounding area to the north, west, and south were primarily developed as agricultural land from the early 1900s up until the 1960s. The area to the east has been developed since the early 1900s, and both residential and commercial development has continued through present day. A closed LRP dry-cleaning site is located approximately 533 feet east (cross-gradient) of the LOD, as well as several other sites with closed OCP cases and petroleum spills between 535 feet to 1,610 feet south and southeast of the LOD. Based on local topography, these sites appear to be either crossgradient or downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4610	<p>The LOD is located along the north side of Darnestown Road (MD 28), northwest of Spring Meadow Drive, in Germantown, Maryland. The surrounding area can be classified as a semi-rural suburban area. Residential houses and open space abut the property in all directions. A small shed is located approximately 50 feet northwest of the LOD. A private residential structure is located further to the northwest. The surrounding area was primarily agricultural land up until the 1990s, when residential development began to occur to the south, west, and southeast. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4613	<p>The LOD is located along the central median of Darnestown Road (MD 28), between Argosy Drive/Dufief Mill Road and Muddy Branch Road, in Gaithersburg, Maryland. Residential properties surround the site to the north and east. A large farm is located to the west of the LOD. A medical center and old repurposed barn are located directly south of the LOD, followed by additional residential properties. Based on historical imagery, the surrounding area was primarily developed as agricultural properties up until the 1970s, with the golf course to the north and residential properties to the west, north, and south constructed in the early 1980s. By 2009, the surrounding area and LOD were observed to be developed in their current configuration. A former military radar site was located approximately 1,050 feet north (upgradient) of the LOD. According to available information, the site was decommissioned in the 1980s and was repurposed by the US Consumer Product Safety Commission. Currently, Montgomery County is proposing to redevelop the site into a public park.. Based on available information provided by MDE through a PIA request, as well as on the MDE LRP website, several USTs have been excavated and removed from the site over the years. No known environmental impacts are known to be present onsite. Thus, impacts to the LOD are unlikely.</p>
WAS-4614	<p>The LOD is located along the south side of Darnestown Road (MD 28), west of Chestnut Oak Drive, in Gaithersburg, Maryland. The surrounding area can be classified as a semi-rural suburban area. Residential dwellings and open space surround the LOD in all directions. The surrounding area was primarily agricultural land up until the 1970s, when residential development began to occur to the south and east. By 2005, following additional residential development to the north and west, the surrounding area was observed to be developed in its current configuration. No records of concern were identified during this environmental review.</p>
WAS-4615	<p>The LOD is located along the north side of the Darnestown Road (MD 28), east of Haddonfield Lane, in Gaithersburg, Maryland. The surrounding area was primarily agricultural land up until the 1970s, when residential development to south and east began. Additional residential development occurred to the north and south up until 2005, when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4619	<p>The LOD is located along the south side of Seneca Road (MD 112), west of Deakins Lane, in Germantown, Maryland. The surrounding area was primarily developed as agricultural land and farms up until the 1980s when residential development began to the northeast and south. Residential development continued up until approximately 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4622	<p>The LOD located within the median at the intersection of Seneca Road (MD 112) and Esworthy Road, in Germantown, Maryland. The surrounding area is primarily suburban, with private residences on large tracts of land abutting the LOD on four sides. The surrounding area was developed with agricultural properties up until the late 1970s, when residential development began to occur. Residential development continued up until 2005, when the LOD and surrounding area were observed to be developed in their current configuration. A residential heating oil UST of unknown size was excavated and removed from a property approximately 470 feet to the southeast (downgradient) of the LOD in 2018. A release was reported, material was cleaned up, and the site received closure approximately 3 months later. Based on local topography, the site is believed to be downgradient of the LOD. A second OCP case was opened in January 1997 at property approximately 725 feet southwest (crossgradient) of the LOD, related to a ground seep investigation. The release was reportedly address and received closure from MDE in June 1997. A spill case opened for a release of approximately 12 ounces of heating oil at a property approximately 565 feet south of the LOD. Based on the distances of the sites relative to the LOD, impacts are unlikely.</p>
WAS-4623	<p>The LOD is located along the west side of Seneca Road (MD 112), immediately south of Springfield Road, in Burtonsville, Maryland. The surrounding area is observed to primarily residential. Up until the 1980s, the surrounding area was primarily rural/agricultural land, when residential development began to occur in all directions of the LOD. The surrounding area was observed to be developed in its current configuration around 2005. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4624	<p>The LOD is located along the west side of Seneca Road (MD 112), south of River Road, in Darnestown, Maryland. Residential structures on large tracts of land abut the LOD to the north, east, and south. A golf course, constructed in the late 1960s, abuts the LOD to the west. The surrounding area was primarily agricultural land up until the late 1960s/early 1970s, when residential development began to occur. By 2005, the LOD and surrounding area were observed to be developed in their current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4625	<p>The LOD is located along the north side of River Road (MD 190), immediately east of Manor Stone Drive, in Potomac, Maryland. The surrounding area is primarily rural/suburban with private residence on large tracts of land. Based on historical imagery, the surrounding area has been primarily forested and agricultural land up until the 1950s, when several residential structures were observed to be present south of the LOD and River Road. By the late 1980s, additional residential structures were observed to the north of the LOD. The surrounding area was observed to be developed in its current configuration by 2009. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4626	<p>The LOD is located along the north side of River Road (MD 190), west of Signal Tree Road, in Potomac, Maryland. The surrounding area is primarily rural suburban with private residence on large tracts of land. Based on a review of historical imagery, the surrounding area was primarily developed as agricultural land up until the 1980s, when residential development to the north, east, and west began to occur. A farm has been located to the south of the LOD, beyond River Road since at least the 1950s. The surrounding area was observed to be developed in its current configuration by 2013. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4627	<p>The LOD is located on the south side of River Road (MD 190), east of Signal Tree Road, in Potomac, Maryland. The surrounding area is primarily suburban with private residence on large tracts of land. The area to the north is forested land. A residential property is located to the south, followed by a farm. Additional residential properties are located to the east and west. Based on a review of historical imagery, the surrounding area was primarily developed as agricultural land up until the 1980s, when residential development to the north, east, and west began to occur. A farm has been located to the south of the LOD, beyond River Road since at least the 1950s. The surrounding area was observed to be developed in its current configuration by 2013. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4628	<p>The LOD is located on the south side of River Road (MD 190), southeast of Signal Tree Road, in Potomac, Maryland. The surrounding area is primarily suburban with private residence on large tracts of land. The area to the north is forested land. A residential property is located to the south, followed by a farm. Additional residential properties are located to the east and west. Based on a review of historical imagery, the surrounding area was primarily developed as agricultural land up until the 1980s, when residential development to the north, east, and west began to occur. A farm has been located to the south of the LOD, beyond River Road since at least the 1950s. The surrounding area was observed to be developed in its current configuration by 2013. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-4629	<p>The LOD is located along the north side of River Road (MD 190), east of Watkins View Lane, in Potomac, Maryland. Residential houses are located to the southeast. Residential development is observed to begin in the 1960s and continue through 2013, when the surrounding area was observed to be developed in its current configuration. Two database listings were identified in the surrounding area. In 1994, a 2000-gallon heating oil UST was closed in place at a residential property approximately 225 feet south of the LOD. Available records did not indicate whether a release occurred and/or clean-up/ remediation was required. An active 2,000-gallon heating oil UST is present at a residence approximately 655 feet to the southeast of the LOD. No records associated with releases or cleanup in connection with the UST were identified. Base on the local topography, both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4630	<p>The LOD is located in a semi-rural/suburban area along the south side of River Road (MD 190), north of Dalyn Drive, in Potomac, Maryland. Residential development is observed to begin in 1971 and continue through 2013, when the surrounding area was observed to be developed in its current configuration. Two database listings were identified in the surrounding area. In 1994, a 2000-gallon heating oil UST was closed in place at a residential property approximately 360 feet northwest of the LOD. Available records did not indicate whether a release occurred and/or clean-up/ remediation was required. An active 2,000-gallon heating oil UST is located at a residence approximately 200 feet to the southeast of the LOD. No records associated with releases or cleanup in connection with the UST were identified. Based on the local topography, the sites are believed to be crossgradient and downgradient of the LOD, respectively. Thus, impacts to the LOD are unlikely.</p>
WAS-4631	<p>The LOD is located along the north side of River Road (MD 190), east of Dalyn Drive, in Potomac, Maryland. The surrounding area is observed to be semi-rural/suburban. Residential development of the area is observed to begin in 1959 and continued through 2012 when the surrounding area was observed to be developed in its current configuration. An active 2,000-gallon heating oil UST is present at a residence approximately 325 feet to the southeast of the LOD. No records associated with releases or cleanup in connection with the UST were identified. The UST is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4633	<p>The LOD is located along the north side of River Road (MD 190), west of Beall Spring Road, in Potomac, Maryland. The surrounding area is observed to be primarily semi-rural/suburban. Residential development was observed to begin in 1981 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4635	<p>The LOD is located along the south side of River Road (MD 190), southwest of Travilah Road/Rivers Edge Drive, in Potomac, Maryland. The surrounding area is considered semi-rural/suburban. A housing complex is located to the southwest of the LOD. Several residential houses and open space surround the property to the north, south, and east. Residential development is observed to have begun around 1981 and continued through 1994, when the LOD and surrounding area were observed to be developed in their current configuration. An OCP case associated with a leaking 1,000-gallon heating oil UST at residential property is approximately 200 feet north of the LOD. Based on case documents provided by MDE, the UST was found to be leaking in 2014. Subsequently, the UST and approximately 40 tons of petroleum impacted soil were excavated and removed from the site in 2015. Additional investigations were conducted that included soil boring sampling and monitoring well installation. Free product up to 3.5 feet thick was identified in several of the monitoring wells as well as the residence's drinking water well. Thus, remediation was conducted that included several rounds of pumping out free product through, when the monitoring wells were abandoned with permission from MDE in 2016. Based on site investigation reports reviewed, the impacted area is isolated to the immediately southeast of the residence, northeast of the LOD, and is believed to not extend near or into the boundaries of the LOD. The case is still open, as MDE has requested that surrounding residence's drinking water wells be tested for the presence of petroleum constituents. Based on the information summarized above, impacts to the LOD unlikely.</p>
WAS-4636	<p>The LOD is located along the south side of River Road (MD 190), south of Drew Lane, in Potomac, Maryland. The surrounding area is primarily residential properties. Residential development in the surrounding was observed to have begun in the 1970s and continued through 2005, when the surrounding area was observed to be developed in its current configuration. In 1994, a 2,000 gallon heating oil UST was closed in place approximately 590 feet to the south of the LOD. Available records did not indicate whether a release occurred and/or clean-up / remediation was required; however, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4637	<p>The LOD is located proximate to the northwest corner of the intersection of River Road (MD 190) and Smoky Quartz Lane, in Potomac, Maryland. The surrounding area is primarily residential. Residential development is observed to have begun prior to 1959 and continued through 2006 when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4638	<p>The LOD is located along the north side of River Road (MD 190), east of Swains Lock Road, in Potomac, Maryland. The surrounding area is primarily residential and forested land. Residential development was observed to begin around the 1950s and continued through 2006 when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4639	<p>The LOD is located along the north side River Road (MD 190), west of Swains Lock Road, and south of Swains Lock Terrace, in Potomac, Maryland. The surrounding area is primarily residential and forested land. Residential development was observed to begin around the 1950s and continued through 2006 when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4640	<p>The LOD is located on the south side of River Road (MD 190), east of Ardnave Place, in Rockville, Maryland. A small portion of the LOD extends to the north over River Road. The surrounding area is observed to be primarily residential. Residential development was observed to begin around 1988 and continue through 2006, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4641	<p>The LOD is located along River Road (MD 190), between Ardnave Place and Marwood Hill Road, in Rockville, Maryland. The surrounding area was primarily developed as agricultural land up until 1988, when residential development began to occur. Residential development continued through 2006, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4642	<p>The LOD is located along the north side of River Road (MD 190), between Tara Road and Daruish Lane, in Potomac, Maryland. The surrounding area was primarily developed as agricultural land up until the early 1980s, when residential development began to occur. Residential development continued up until approximately 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4644	<p>The LOD is located along the south side of River Road (MD 190), immediately east of Marwood Hill Road, in Rockville, Maryland. The surrounding area was primarily developed as agricultural land up until 1981, when residential development began to occur. Residential development continued through 2006, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4645	<p>The LOD is located along River Road (MD 190), east of Daruish Lane in Potomac, Maryland. The surrounding area was primarily developed as agricultural land up until 1981, when residential development began to occur. Residential development continued through 2006, when the surrounding area was observed to be developed in its current configuration. Two sites with former or current UST were identified in the vicinity of the LOD. In 2007, an OCP case was opened during a residential heating oil tank closure at a property approximately 325 feet to the north of LOD. Impacted material was encountered during the removal of the UST, which was addressed and the case received closure from MDE approximately 3 months later. The second site of concern is associated with a residential property with a 3,000-gallon residential heating oil UST (installed in 1980) currently in use. The UST is located over 500 feet north of the LOD. Based on local topography both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4646	<p>The LOD is located along the north side of River Road (MD 190), west of Riverwood Drive, in Potomac, Maryland. The surrounding area was primarily developed as agricultural land up until 1981, when residential development began to occur. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. There are two sites were identified in the database report, in the vicinity of the LOD. In 2007, an OCP case was opened during a residential heating oil tank closure at a property approximately 220 feet to the north of LOD. Impacted material was encountered during the removal of the UST, which was addressed and the case received closure from MDE approximately 3 months later. The second site of concern is associated with a residential property with a 3,000-gallon residential heating oil UST (installed in 1980) currently in use. The UST is located over 535 feet north of the LOD. Based on local topography both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4647	<p>The LOD is located along the east side of River Road (MD 190), east of Sanding Landing Road, in Potomac, Maryland. The surrounding area was primarily developed as agricultural land up until 1981, when residential development began to occur. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during the environmental review.</p>
WAS-4651	<p>The LOD is located along the west side of River Road (MD 190), northwest of Potomac Manors Drive, in Rockville, Maryland. The surrounding area is primarily residential, with a school to the northeast and commercial development further to the southeast. Residential development is observed to begin prior to 1964 and continued through 2005, when the surrounding area is observed to be developed in its current configuration. A school located 185 feet from the LOD had a 10,000-gallon heating oil UST excavated and removed from the site in July 1995. Based on available records provided by MDE, after the UST had been removed from the ground, the soil interval below the grade of the bottom of the UST was checked for volatile organic compounds using a PID by an inspector from MDE. Readings ranged from 1 ppm to 28 ppm. Based on the PID readings, the inspector instructed the UST removal contractor to backfill the excavation and the case was officially closed approximately 2 months later. The school is also listed as having a RCRA permit; however, records state that the school has no current or previous violations associated with the handling and disposals of hazardous waste. All other sites with environmental concerns are believed to be located at least 480 feet crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-4653	<p>The LOD is located along the east side of Falls Road (MD 189), north of Glenolden Drive, in Potomac, Maryland. The surrounding area is primarily residential with some commercial development to the south. Residential and commercial development is observed to begin by 1959 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4655	<p>The LOD is located along the north side of River Road (MD 190), immediately west of Newbridge Drive, in Rockville, Maryland. The surrounding area is primarily residential. Residential development is observed to begin prior to 1964 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4656	<p>The LOD is located along the north side of River Road (MD 190), immediately east of Newbridge Drive, in Rockville, Maryland. The surrounding area is primarily residential. Residential development is observed to begin prior to 1964 and continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>
WAS-4657	<p>The LOD is located along the north side of River Road (MD 190), southeast of Newbridge Drive and northwest of Belle Terre Way, in Potomac, Maryland. The surrounding area is primarily residential. Residential development was observed to begin prior to 1964 and continued through 2005, when the surrounding area was observed to be developed similar to its current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4658	<p>The LOD is located along the south side of River Road (MD 190), southeast of Newbridge Drive and northwest of Belle Terre Way, in Rockville, Maryland. The surrounding area is primarily residential. Residential development was observed to begin prior to 1964 and continued through 2005, when the surrounding area was observed to be developed similar to its current configuration. No records of concern in the vicinity of the LOD were identified during the environmental review.</p>
WAS-4659	<p>The LOD is located along the east side of Falls Road (MD 189), north of Winterset Drive, in Rockville, Maryland. The surrounding area is primarily residential developments. The surrounding area was primarily observed to be developed with agricultural properties up until the early 1970s, when residential development began to occur. Residential development continued in directions of the LOD up until approximately 2018, when the surrounding area was observed to be developed in its current configuration. A church located 485 feet of the LOD had one 4,000-gallon UST removed in 1997 and new 4,000-gallon UST was installed in its place. No impacted material was encountered during the closure of the former UST. A residential property located approximately 430 feet to the southeast had a residential heating oil UST excavated and removed from property in 1999. According to available records, impacted material was encountered and cleaned-up/ remediated. The case was closed 16 months later. Based on local topography, both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-4660	<p>The LOD is located along the west side of Falls Road (MD 189), between Winterset Drive and Falls Chapel Way, in Rockville, Maryland. The surrounding area is primarily residential. Based on a review of historical imagery, the surrounding area was observed to be developed as agricultural land until the early 1970s, when residential development began to occur. Residential development continued in all directions of the LOD up until approximately 1988, when the surrounding area was observed to be developed in its current configuration. A residential property located approximately 615 feet to the southeast had a residential heating oil UST excavated and removed from property in 1999. According to available records, impacted material was encountered and cleaned-up/ remediated. The case was closed 16 months later. Based on local topography, the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-5301	<p>The LOD is located along the west side Germantown Road (MD 118), south of Brookmead Drive, in Germantown, Maryland. Residential structures on medium tracts of land surround the LOD. Based on historical imagery, the surrounding area appeared to be primarily agricultural up until the early 1980s, when residential development began to occur. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. One spill case resulting in the release of less than a gallon of heating oil occurred at a residence approximately 335 feet west of the LOD in 1994. The material was contained and cleaned up. An OCP case was opened at a private residence approximately 250 feet southwest of the LOD due to release from a residential heating oil AST. The material was cleaned-up/remediated and the case was closed approximately 5 months later. Both of these sites summarized above are believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-5302	<p>The LOD is located along the west side of Germantown Road (MD 118), south of Citizens Lane, in Germantown, Maryland. Residential structures on medium tracts of land are to the north, south, east, and west of the LOD. Butler Montessori school is further to the east and has a NPDES permit. Based on historical imagery, the surrounding area appeared to be primarily agricultural up until the early 1980s, when residential development began to occur. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. An OCP case was opened in August 2019 that was associated with the closure of a residential heating oil UST at a property approximately 245 feet southwest of the LOD. According to available information, impacted material was encountered and remediated/ cleaned up. The case received closure from MDE approximately 3 months later. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts are unlikely.</p>
WAS-5304	<p>The LOD is located along the east side of Germantown Road (MD 118), west of Quince Orchard Substation, in Germantown, Maryland. The Quince Orchard Substation, a 230,000-volt substation, is located to the east of the LOD. Based on the aerial photographs the surrounding area was primarily developed as agricultural land up until 1959, when the substation was observed to be present, west of the LOD. Residential development continued slowly to the north and south through 1993, when the surrounding area was observed to be developed in its current configuration. No environmental database listings were identified in the immediate area of the LOD.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-5306	<p>The LOD is located along the east side of Germantown Road (MD 118), south of Riffle Ford Road, in Germantown, Maryland. Residential structures on small tracts of land are located to the north and east of the LOD. A church is located to the south and a park is located to the west. Based on a review of historical imagery, the surrounding area was primarily agricultural up until the later 1950s, when residential development was observed to the north and south of the LOD. Residential development continued to the east and northwest through 2005, when the surrounding area was observed to be developed in its current configuration. No environmental database listings were identified in the immediate area of the LOD.</p>
WAS-5307	<p>The LOD is located along the west side of Germantown Road (MD 118), south of Richter Farm Road, in Germantown, Maryland. Residential structures on small tracts of land are observed in all directions of the LOD. A high school is located further to the east. Based on historical imagery, the surrounding area was primarily developed with agricultural properties until the early 1980s, when residential development began. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. A SPILLs case related to a sewage release of approximately 2-gallons was listed approximately 450 feet southwest of the LOD. An OCP case related to release of heating oil associated with a heating oil AST in 2003 at residential property was listed approximately 525 feet southwest of the LOD. The release was cleaned up/ remediated and the case was closed two days later. Both sites are believed to be crossgradient of the LOD. Thus, impacts are unlikely.</p>
WAS-5308	<p>The LOD is located along the central median of Great Seneca Highway (MD 119), north of Queenstown Lane, and south of Leaman Farm Road, in Germantown, Maryland. Residential properties are located to the north and south of the LOD. A stream and forested land to the east and west. A school is located further to the southwest. Based on historical imagery, the surrounding area was primarily developed with agricultural properties until the early 1980s, when residential development began. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD that are believed to impact site were identified during this environmental review.</p>
WAS-5310	<p>The LOD is located along the central median of Quince Orchard Road (MD 124), south of Pawnee Drive, in Gaithersburg, Maryland. Based on historical imagery, the surrounding area was primarily developed with agricultural properties until the early 1980s, when residential development began. Residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. A residential heating oil UST was excavated and removed from a property approximately 210 feet to the west of the LOD in July 1997. Impacted material was encountered during the removal of the UST, which was addressed, and the case received closure approximately 5 month later. Based on the local topography, the site is believed to be downgradient of the LOD. One spill case associated with the release of less than gallon of hydraulic fluid was identified approximately 150 feet from the LOD. Two OCP cases were identified between 440 and 470 feet south of the LOD. Based on the local topography, the sites are believed to be either crossgradient or downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-5311	<p>The LOD is located along the north side of Darnestown Road (MD 28), north of Jones Lane, in Darnestown, Maryland. The LOD is observed to be surrounded by residential structures. A church is located further to the northeast. Based on historical aerial and topographic maps, the surrounding area appeared to be primarily developed as agricultural land up until the 1970s, when residential development began to occur. Residential development continued up until 2005, when the surrounding area was observed to be developed in its current configuration. A SPILLS case associated with a release of approximately 10-gallons of sewage was identified at a residential property approximately 100 feet south-southwest (downgradient) of the LOD. Based on the volume and nature of the release, impacts to the LOD are unlikely.</p>
WAS-5312	<p>The LOD is located along the north side of Darnestown Road (MD 28), west of Norman Drive in Gaithersburg, Maryland. Residential structures are located in all directions of the LOD. A church is located to the north. Based on historical aerial and topographic maps, the surrounding area appeared to be primarily developed with agricultural properties through 1971, when residential development that began and continued through 2005, when the surrounding area was observed to be developed in its current configuration. Three properties with residential heating oil UST closures were identified between 230 to 615 feet of the LOD. Impacted subsurface materials were reported two of the properties located 525 feet to the south and 615 feet to the north. Based on available records, the impacted material was cleaned-up/ remediated and the cases were both closed in less than one month after the cases were initially opened. Based on local topography, the sites are believed to be either downgradient or crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-5313	<p>The LOD is located, along the south side of Darnestown Road (MD 28), east of Copen Meadow Drive in Gaithersburg, Maryland. Residential structures are located to the north, south, and west of the LOD. The Quince Orchard High School is located to the southeast. Based on historical aerial and topographic maps, the surrounding area was primarily developed as agricultural land up until the 1980s, when residential development was observed to the northwest, west, and southwest. Development in the area continues through present day, as a townhome community is observed to be under construction, northeast of the LOD. One environmental database listing was identified in the immediate area of the LOD. The Sunoco gas station is located approximately 530 feet to the northeast. The gas station is listed in several databases, including three OCP listings, all of which received closure. The first was during a tank closure that was opened on 7/31/1987 and closed on 4/8/1999; the second OCP release occurred from a tank truck driver and the case was opened on 4/20/2001 and closed on 5/23/2001; and the third release was due to a tank closure and was opened on 3/12/2002 and closed on 3/11/2005. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-5314	<p>The LOD is located, along the south side of Darnestown Road (MD 28), east of Copen Meadow Drive, in Gaithersburg, Maryland. Residential structures are located to the north, south, and west of the LOD. The Quince Orchard High School is located to the southeast. Based on historical aerial and topographic maps, the surrounding area was primarily developed as agricultural land up until the 1980s, when residential development was observed to the northwest, west, and southwest. Development in the area continues through present day, as a townhome community is observed to be under construction, northeast of the LOD. No environmental database listings were identified in the immediate area of the LOD.</p>
WAS-5315	<p>The LOD is located along the side of Darnestown Road (MD 28), east of Quince Orchard Drive (MD 124), in Gaithersburg, Maryland. Commercial structures are located to the north, south, and west of the LOD. The MCFR Fire Station 31 is located to the south. Potomac Garden Center is located to the east. Rachel Carson Elementary School is located to the northeast. Residential properties are located beyond in all directions. Based on a review of historical imagery, the surrounding area appeared to be primarily agricultural land agricultural, up until the early 1980s when commercial development began. By 2005, the LOD and surrounding area appeared to be developed in its current configuration. Five environmental database listings were identified in the immediate area of the LOD. A current nursery had two UST removed from the site at least 265 feet southeast (downgradient) of the LOD. No substantial impacts were encountered. Fire station located directly south of the LOD had the UST removed from the site between 2010 and 2014. No impacted soil was encountered during the removal of the USTs. A drycleaner is located approximately 550 feet northwest of the LOD, there have been no reported violations associated with the facility. Additionally, two gas stations are located between 530 and 570 feet west/northwest of the LOD. Both are known to have impacted soil and groundwater onsite; however, both sites area believed to be crossgradient of the LOD, based on the local topography. Thus, impacts to the LOD are unlikely, based on the downgradient and crossgradient proximity of these sites, relative to the LOD.</p>
WAS-5316	<p>The LOD is located along the central median of Great Seneca Highway (MD 119), west of Deer Ridge Road, in Gaithersburg, Maryland. Forested land surrounds the LOD. Clopper Lake within the Seneca Creek State Park is located further to the northeast. Seneca Creek Disc Golf Course is located to the south. Based on historical aerial and topographic maps, the surrounding area was a mixture of agricultural and forested land up until the 1990s, when the agricultural land reverted back to forested land. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>
WAS-5317	<p>The LOD is located along the central median of Great Seneca Highway (MD 119), east of the WWTP (12600 Great Seneca Highway), in Germantown, Maryland. Forests are located to the north, south, and east of the LO. The Seneca Wastewater Treatment Plant is located to the west. Based on historical aerial and topographic maps, The surrounding area was primarily agricultural land up until the 1990s, when the Great Seneca Highway and the WWTP was constructed around 1993. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

LOD ID	<p style="text-align: center;">Low Risk LOD Table</p> <p>Ranking Rationales</p>
WAS-5601	<p>The LOD is located along the north side of Darnestown Road (MD 28), north of Prairie Landing Way, in Potomac, Maryland. Residential development is to the west and south, and a farm to the north. Commercial development is located to the east. The area surrounding the LOD was mostly developed by the late 1980's. Two sites were identified in the environmental database search: a site with multiple OCP cases for UST releases is located approximately 450 feet southeast of the LOD, and a pharmacy that is a registered RCRA VSQG is located approximately 605 feet to the east of the LOD. Based on the local topography the sites are believed to downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>
WAS-5602	<p>The LOD is located along the north side of Key Road, north and east of Darnestown Road (MD 28), in Rockville, Maryland. A farm is located to the northwest, commercial development to the north- and southeast, and residential to the southwest. The area surrounding the LOD was mostly developed by the late 1980's; an office complex built in the early 2000's and occupied mostly by pharmaceutical companies is located to the northeast. Two sites were identified in the environmental database search: a site with multiple OCP cases for UST releases is located approximately 300 feet south of the LOD, and a pharmacy that is a registered RCRA VSQG approximately 80 feet south of the LOD. Based on the local topography the sites are believed to downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD-Specific Project Area Site Descriptions

Project Area Site Descriptions

LOD ID: MO_00018	Site Rank: Low	Figure Location: 
Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Along Rock Run stream, west of Falls Bridge Lane	
City	Potomac	
County	Montgomery	
Type of property	Public ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along a stream known as Rock Run, west of Falls Bridge Lane and between Falls Road and Oaklyn Drive, in Potomac, Maryland. The surrounding area is residential with commercial properties located further to the north. The surrounding area was primarily forested and agricultural land up until the 1960s when residential development began to occur to the east, west, and south, and commercial development to the north. By 1981, the surrounding area was observed to be developed in its current configuration. Nine OCP cases associated with residential heating oil USTs and ASTs are located between 115 feet to 640 feet to the east, west, and south of the LOD. Based on the local topography, the OCP cases are either cross- or downgradient of the LOD. Based on their distance, lack of release, or hydraulic direction from the LOD, none of these sites are believed to have an impact on the LOD. Additionally, two closed MDE Land Restoration Program/Voluntary Clean-Up Program (LRP/VCP) sites with land-use restrictions were identified. These include the Potomac Promenade and the Potomac Place Shopping Center, located approximately 400 feet to the north and 640 feet to the northeast of the LOD, respectively. Based on information provided by MDE, chlorinated solvents in soil and groundwater are present beneath both sites; however, the impacted areas appear to be isolated to each of the properties. The impacted area within the Potomac Promenade Site is approximately 500 feet to the north of the LOD, while the impacted area on the Potomac Place Shopping Center is believed to be approximately 1,075 feet to the northeast of the LOD. Since environmental impacts do not appear to have migrated outside the boundaries of either site, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	9510 Hall Road	115	SPILLS - Approximately 1-gallon of heating was released onto the floor of a basement due to a faulty fitting. The material was contained and cleaned up.	Low
2	Potomac Village Medical Center 9800 Falls Rd	210	FINDS/FRS, RCRA SQG – Generator of corrosive and silver waste, no violations noted.	Low
3	Cecelia Wraase 9720 Brimfield Ct	395	OCP – A residential heating oil UST was closed in 1994. Records state that a release did not occur nor was remediation needed.	Low
4	LARRY HANDEN RESIDENCE/ 10101 GARDEN WAY	450	UST – One residential heating oil UST was excavated and removed from the property in 2006. Impacted subsurface media was encountered during the removal, which was addressed and the case was closed four months later. Based on the local topography, this site appears downgradient of the LOD,	Low
5	MERRILL COHEN RESIDENCE/ 10105 GARDEN WAY	460	UST – One residential heating oil UST was excavated and removed from the property in 2017. Impacted subsurface media was encountered during the removal, which was addressed and the case was closed four months later. Based on the local topography, this site appears downgradient of the LOD.	Low
6	LARRY BROWN/ 10104 GARDEN	495	AST – A residential heating oil AST was reported to MDE due to a leak. It is believed the leak was addressed and any release was cleaned up, since the case was closed the same day. Additionally, the site appears downgradient of the LOD, based on the local topography.	Low
7	GRIFFITH SPILL/ 9200 FALLS BRIDGE LANE	550	AST – A residential heating oil AST was reported to MDE due to a leak. It is believed the leak was addressed and any release was cleaned up, since the case was closed two months later. Additionally, the site appears crossgradient of the LOD, based on the local topography.	Low
8	BEN CONSILVIO RESIDENCE/ 10401 LOGAN DR	555	UST – One residential heating oil UST was excavated and removed from the property in 2014. Impacted subsurface media was encountered during the removal, which was addressed and the case was closed one month later. Based on the local topography, the site appears downgradient of the LOD.	Low

Project Area Site Descriptions

9	Potomac Promenade 9812 Falls Road	500	LRP, VCP, SHWS, RCRA-CESQG, OCP, UST, DRYCLEANER, FINDS/FRS – According to information provided by the MDE LRP program, prior to 1970 the property was undeveloped woodlands. The three existing commercial buildings on the property were constructed in 1970, 1978 and 1988, totaling 26 tenant spaces. One of the tenants listed was a dry-cleaning facility that previously used perchloroethylene (PCE) in its operations. Several prior Phase ESAs listed the dry-cleaning facility as a concern. Additionally, in October 2008, a diesel fuel underground storage tank (UST) associated with a grocery store tenant was closed in-place, and an aboveground storage tank installed above its current location. Prior to being closed in-place, the UST was cleaned and filled with fly ash. MDE closed the OCP associated with the UST closure on May 5, 2010. On February 28, 2012, the VCP accepted the property for participation and issued a No Further Requirements Determination for the Potomac Promenade property conditioned on use of the property for restricted commercial or restricted industrial purposes, cap maintenance and soil disposal requirements for specific areas of the property, and a prohibition on the use of groundwater beneath the property. Based on data and information provided by MDE, the area impacted by chlorinated solvents is isolated to the west-central portion of the LOD, approximately 500 feet north of the LOD and there is no indication that offsite migration of any impacts has occurred.	Low
10	RON SIDI RESIDENCE/ 10319 SNOWPINE WAY	615	OCP – One residential heating oil UST was excavated and removed from the property in 2014. Impacted subsurface media was encountered during the removal, which was addressed and the case was closed one month later.	Low
11	SOBEL MURRAY-HICKEY RESIDENCE 10405 LOGAN DR	640	OCP - One residential heating oil UST was excavated and removed from the property in 2014. Impacted subsurface media was encountered during the removal, which was addressed and the case was closed a month and a half later. Based on the local topography, the site appears to be downgradient of the LOD.	Low
12	Cissel Residence 9308 Langford Court	640	OCP, UST – One 550-gallon residential heating oil UST was excavated and removed from the property in 2003. Impacted subsurface media was encountered during the removal, which was addressed and the case was closed in 2005. Based on the local topography, the site appears upgradient of the LOD.	Low

Project Area Site Descriptions

2919	Potomac Place Shopping Center 10100-10154 River Road	1,075	VCP, SHWS, LUC – The site is located at 10100 -10154 River Road, south of the intersection of River Road and Falls Road, approximately 670 feet to the northeast. The site has been utilized as a retail shopping center since 1967-1968. An on-site dry-cleaning facility (Crest Cleaners) occupied a tenant space near the eastern end of the shopping center between 1968 and 1987. Chlorinated solvents attributed to the Crest Cleaners dry cleaning operation were detected in soil and groundwater at the eastern end of the facility, approximately 1,075 feet to the northeast of the LOD. A series of groundwater monitoring and recovery wells were installed at the Site between 1994 and 1996. A groundwater pump and treat system ran at the site between July 1996 and November 1998. The site received closure for from MDE with groundwater use restrictions in 2006. Based on data and information provided by MDE, the area impacted by chlorinated solvents is isolated to the northeastern portion of the site, approximately 1,075 feet to the northeast of the LOD.	Low

Project Area Site Descriptions

LOD ID: MO_00029	Site Rank: Low	Figure Location: 
Quadrant:	NW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Along Silver Creek, between Rock Creek and Littledale Road	
City	Kensington	
County	Montgomery	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along Silver Creek, a tributary of Rock Creek further to the south, located in Kensington, Maryland. The LOD is north of I-495, east of Kensington Parkway, south of Littledale Road and bisected by Saul Road, East Bexhill Drive and Beach Drive. The surrounding area is primarily residential. A middle school and senior living center abut the northeastern boundary of the LOD. The southern portion south of Beach Drive and north of I-495 is primarily forest land along Rock Creek, flowing west to east. Residential development began before the 1930s to the east and north and continued through early 1960s. In the 1940s a junior high school was constructed to the east of the northern portion of the LOD, near where the current middle is situated. The high school was demolished around 1988 and the site was converted into a park until 1998, when the senior living center was constructed and eventually the new middle school in 2017. During construction of the new middle school, a 10,000-gallon heating oil UST associated with the old junior high school was identified. Available records and analytical data provided by MDE indicate that the former UST had not substantially impacted soils beneath the former UST. Two OCP cases related to spills were identified near the LOD. The first OCP case, located approximately 15 feet west of the southern portion of the LOD, was likely a surficial release associated with a vehicle accident based on the location description. Based on the local topography, any material released to the surface would have flowed towards the west to southwest, away from the LOD. The second OCP case, occurring approximately 430 feet west of the central portion of the LOD, does not specifically state a release or cleanup actually occurred. Both cases have received closure and impacts were most likely isolated and surficial in nature. Thus, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	WASHINGTON GAS SPILL/BEACH DR & KENSINGTON PKWY	15	OCP – On 4/4/2001, a release occurred at the intersection of Beach Drive and Kensington Parkway. According to available records a release occurred which was cleaned-up / remediated. The case received closure approximately 6 months later, on 10/31/2001. A PIA request was submitted to MDE; however, the files for the incident have been destroyed per MDE's file retention protocols. The release was most likely surficial in nature and would not have affected subsurface soil or groundwater. Based on the local topography, any material released would have most likely flowed towards the west/southwest, away from the LOD.	Low
2	SILVER CREEK MIDDLE SCHOOL/ 3701 SAUL ROAD	145	UST, OCP, SPILLS – In June 2017, during the construction of new middle school, a previously unidentified 10,000-gallon heating oil UST was discovered that excavated and removed from the site. The UST was found to be in good condition. No odors or staining were observed in the excavation. PID readings from the bottom of the excavation were 0.0 ppm. Three confirmation soil samples were collected from the excavation and analyzed for TPH-DRO and VOCs, which were all non-detect, with the exception of one detection of TPH-DRO at 19 mg/kg. Based on the information no substantial subsurface impacts associated with former UST exist. MDE closed the case approximately 2.5 months later. FINDS/FRS – Air monitoring site.	Low
3	BI-COUNTY WATER TUNNEL/ 9212 KENSINGTON PAR BTWN TUCKERMAN LN-STONEYBROOK	360	FINDS/FRS, ICIS – The facility had a minor NPDES permit related to the construction of the facility that expired in 2019. The site appears downgradient of the LOD, based on the local topography.	Low
4	CORMAN CONSTRUCTION INC SPILL/ 9901 CONNECTICUT AVE	430	OCP – In July 6, 1990, an OCP was opened approximately 430 feet west of the northern half of the LOD. The available records do not state whether or not a release occurred and/or if remediation/cleanup was required. The case was closed approximately 3 weeks later.	Low

Project Area Site Descriptions

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1937	The LOD is undeveloped. Residential properties are observed to the west and north. The area to the south and west is primarily vacant and forested land.	Aerial
1944	Additional residential development is observed to the north and south. Kensington Junior High School is observed to the east of the northern portion of the LOD.	Topo
1963	Substantial residential development is observed in all directions of the LOD.	Aerial
1988	The Kensington Junior High School is observed to have been demolished the site is now a park.	Aerial
1998	The senior living center is observed to the east of the northern portion of the LOD.	Aerial
2018	The new Kensington Middle School is observed to have been constructed to the east of the northern portion of the LOD, next to the Senior Living Center.	Aerial

Street Address/Nearest Cross Streets	Unnamed stream, west of Little Falls Parkway and east of Kennedy Drive	
City	Bethesda	
County	Montgomery	
Type of property	State-Owned	
Ranking Rationale Site Summary		
<p>The LOD is located along an unnamed stream on forested land owned by the Maryland National Capitol Planning Commission, directly west of the Little Falls Road and east of Kennedy Drive, in Bethesda, Maryland. The surrounding area has been primarily residential since at least the 1960s. A municipal pool and sports field were first observed to the east, beyond Little Falls Road in a 1981 aerial photograph. No substantial changes to the surrounding area were observed past 1981. A facility listed in the UST and OCP databases, located 750 feet to the east, involved the closure of a heating oil UST in 1998. No environmental impacts were encountered during the closure of the heating oil UST. Based on the distance of the former UST and lack of impacted media encountered during the closure, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	Along unnamed tributary of Northwest Branch Anacostia River, north of Bonifant Road	
City	Silver Spring	
County	Montgomery	
Type of property	MNCPPC and Montgomery County Board of Education	
Ranking Rationale Site Summary		
<p>The LOD is located along an unnamed tributary of Northwest Branch Anacostia River, north of Bonifant Road, south of Stonegate Road, east of Notley Road and Stonewall Drive, and west of Stonegate Drive, in Silver Spring, Maryland. The surrounding area is primarily residential with the exception of a municipal pool directly north of the LOD (constructed in mid-1980s) and a school directly west of the northern portion of the LOD (constructed in the mid-1970s). The surrounding area was primarily agricultural land, up until the 1970s, when residential development began to the west, north, and southeast of the LOD. Residential development continued through the late 1980s, when the LOD and surrounding area were observed to be developed in their current configuration. Three OCP cases were identified in the surrounding area. The adjacent elementary school had a 10,000-gallon heating oil UST removed in 2000. According to available records, no holes were observed in the excavated UST and no impacted soils were encountered. PID readings from the bottom of the excavation were recorded at around 27 ppm. The MDE inspector on-site instructed the excavation to be backfilled and the case was subsequently closed. The second OCP, located 470 feet from the LOD, was associated with the removal of a 550-gallon heating oil UST. No release was noted with this UST. The third OCP case, located 565 feet from the LOD, also involved the removal of a 550-gallon heating oil UST. A release from a product line was noted, which was addressed and the case subsequently closed. Two de minimis surface release were also noted, neither of which would impact the LOD.</p>

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	14813 STONEGATE TERRACE	210	HMIRS – Approximately 0.125-gallon of heating oil was spilt during the filling of a residential heating oil tank in 2001. According to available records, the material was contained and cleaned-up by the responsible party, Griffith Energy Services, Inc.	Low
2	14612 Woonsockett Drive	275	SPILLS – A caller reported that a fluorescent tube had broken and mercury had possibly been released. According to the EPA, fluorescent tubes have between 3.5 to 15 milligrams of mercury contained in them.	Low
3	STONEGATE SWIM CLUB/ 220 STONEGATE DRIVE	295	FINDS/FRS – The facility has an active NPDES permit, no violations noted.	Low
4	NASH PROPERTY/ 15116 WATERGATE RD	470	OCP – According to available records, a 550-gallon residential heating oil UST was closed at the property. The case was opened on 06/14/1996. No reported release or cleanup associated with the UST occurred. The case was closed approximately 5-months later. Based on the local topography, the site appears upgradient of the LOD.	Low
5	JOHN WALSH RESIDENCE/ 15120 WATERGATE RD	565	OCP – According to available records, a 550-gallon residential heating oil UST was excavated and removed from the property in 1997 because it was believed to have been leaking. An MDE inspector onsite did not observe and any staining or odors in the soils from the excavation, as well as all soil PID readings were negative. Based on further investigation, the product line was found to have a leak, which was addressed and the case was closed approximately one and half months later. Based on the local topography, the site appears upgradient of the LOD; however, any impacts are believed to be isolated to the property.	Low
6	STONEGATE ELEMENTARY SCHOOL 14811 NOTLEY ROAD	200	OCP, UST – One 10,000-gallon heating oil UST was excavated and removed from the ground on 8/8/2000. According to available records, no holes were observed in the excavated UST and no impacted soils were encountered. PID readings from the bottom of the excavation were recorded at around 27 ppm. The MDE inspector on-site instructed the excavation to be backfilled and the case was closed approximately 8.5 months later. FINDS/FRS – Minor air permit	Low

Street Address/Nearest Cross Streets	Along unnamed tributary of Rock Creek, south of Veirs Mill Road	
City	Rockville	
County	Montgomery	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along an unnamed tributary of Rock Creek, south of Veirs Mill Road (MD 586), east of Halpine Road/Twinbrook Parkway and north of Elsdale Court, in Rockville, Maryland. The area to the south and west is currently developed with multi-family residential complexes. Forested land along Rock creek is observed to the east and north, followed by residential neighborhoods beyond. The surrounding area was primarily agricultural and forested land up until the late 1950s, when residential development and construction of Veirs Mill Road were observed to then north/northwest. The apartment complexes to the west were observed to be present by the early 1970s. Residential development continued to the west and northwest through approximately the early 1980s, when the surrounding area was observed to be developed in its current configuration. In 2016, residents in the apartment complex to the west of the LOD lodged a complaint related to air emissions associated with diesel generators used by Washington Sewer and Sanitary Commission during an unspecified work activity. It is unknown if the air emission complaint was resolved; however, since this is a complaint was related to air emissions and not a release to soil and/or groundwater, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	Along Willett Branch, east of Little Falls Parkway and Arlington Road	
City	Bethesda	
County	Montgomery	
Type of property	Public	
Ranking Rationale Site Summary		
<p>The LOD is located along Willett Branch, east of Little Falls Parkway and Arlington Road in Bethesda, Maryland. The LOD is bisected by Hillandale Road and consists of forested land managed by the Maryland National Capitol Parks and Planning Commission. The surrounding area has been primarily residential since at least the 1960s. A municipal pool directly west of the LOD and sports fields to the northeast. No substantial changes to the surrounding area were observed past 1981. An OCP case was opened in November 1995 in response to a citizen reporting a petroleum odor and observable sheen on Willett Branch, within the LOD. An MDE inspector was mobilized who also observed the odor and sheen, but could not find a source. The surrounding area was searched for leaking residential heating oil tanks and discarded petroleum containers, but neither were found. The MDE inspector concluded that someone had illicitly dumped waste oil into the stream. The site was inspected by MDE approximately 1 month later and no evidence of petroleum or odors were encountered. Subsequently, the OCP case was closed. Based on the available information, the amount of oil that was illicitly discharged appears to have been minimal in volume. Further, over the past 26 years, natural attenuation processes such as dilution, dispersion and biological degradation would have been ongoing to reduce any residual impacts that originally occurred. Thus, impacts are not anticipated to remain within the LOD.</p>

Quadrant:	NW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Along unnamed tributary of Sand Branch, east of Glen and Travilah Roads	
City	Rockville	
County	Montgomery	
Type of property	Public	
Ranking Rationale Site Summary		
<p>The LOD is located along an unnamed tributary of Sand Branch, east of Glen and Travilah Roads and south of Briarbush Lane, in Rockville, Maryland. The surrounding area is primarily residential. A park/sports field abuts the LOD to the south. The surrounding area was primarily agricultural land with residential and farm properties interspersed throughout. Starting the 1980s, residential development began on the adjoining properties. The park/sports field to the south of the LOD was constructed in 2015. Two records of concern were identified. The first, an OCP case located 265 north of the LOD, was opened for the removal of a 550-gallon residential heating oil UST in May 1999. According to documents provided by MDE, impacted soils were identified in the excavation following removal of the UST. A soil sample was collected outside the excavation as well as a groundwater sample from an onsite potable well which were later analyzed for TPH-DRO and BTEX. The analytical results were non-detect for both the soil and groundwater sample and MDE subsequently closed the case. Based on this information, the identified impacts appear localized to the former UST; therefore, impacts to the LOD from this incident are unlikely. The second record, an ERNS and SPILLS incident located 635 feet to the west, was associated with leaking drums and paint containers. Based on distance and hydraulic direction (downgradient), this incident is unlikely to have any impact on the LOD.</p>

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of the southeastern onramp of northbound Central Avenue (MD 214) from I-495, in Hyattsville, Maryland. The surrounding area was primarily agricultural and forested land up until 1964, when the capital beltway (I-495) was constructed. Development to the north, south, and southwest had continued up until present day, as a residential development is observed to be under construction directly southeast of the LOD. No records of concern in the vicinity of the LOD were identified during this environmental review.</p>

Street Address/Nearest Cross Streets	North side of Central Avenue (MD 214), west of the onramp to northbound I-495	
City	Upper Marlboro	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
The LOD is located along the north side of Central Avenue (MD 214), west of the onramp to northbound I-495, in Upper Marlboro, Maryland. The surrounding area is primary commercial with some multitenant residential facilities. A residential development is observed to be under construction to the south of the LOD. Based on a review of historical imagery, I-495 was constructed in the early to mid-1960s. The surrounding area was primarily agricultural land forested and up until the 1980s, when commercial and residential development was observed to occur. Development in the area continues to occur through present day. No records of concern in the vicinity of the LOD that are believed to impact the LOD were identified during this environmental review.

Quadrant:	NE	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Northwest corner of Hill Road and Central Avenue (MD 214)	
City	Pepper Mill Village	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the northwest corner of the intersection of Central Avenue (MD 214) and Hill Road, in Pepper Mill Village, Maryland. Forest and commercial properties are located to the east and west of the LOD, forest and residential properties to the north, and residential properties and cleared vacant land to the south. Based on a review of historical imagery, the surrounding area was historically agricultural land up until the 1970s, when a group of residential apartment complexes were observed to the south, beyond Central Avenue, as well as commercial properties to the east and west. Development continued in all directions up until 1989, when the surrounding area was observed to be developed in its current configuration. In 1997, a motor vehicle accidental resulted in a surficial petroleum release at the intersection of Hill Road and Central Avenue. The material was addressed and the case was closed two days later. The release would have been surficial to an impervious surface (the roadway) and was cleaned up; therefore, impacts to the LOD are unlikely. In May 2017, a vehicle struck a transformer located 655 feet from the LOD releasing 50 gallons of mineral oil. Based on the distance of this incident from the LOD, impacts to the LOD are unlikely.</p>

City	Upper Marlboro	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the south side of Central Avenue (MD 214), west of Campus Way, east of Landover Road (MD 202), in Upper Marlboro, Maryland. Residential neighborhoods are located to the north and southwest, while commercial facilities are located immediately south and east, and further to the west. The surrounding area was primarily vacant agricultural land until approximately the 1970s, when commercial and residential development began. Three facilities of concern were identified, a Maryland DMV office, a former dry cleaners, and a gas station. The DMV facility received an administrative NOV in 2011 for an unknown reason. No other violations were found in regard to this facility. Based on the age this violation and no reports of an environmental release, it is not considered a concern. A shopping center directly to the southeast (crossgradient) previously had a dry cleaner that conducted dry cleaning onsite. Several other facilities in the shopping center area were listed as having RCRA permits and a 1,000-gallon heating oil UST was removed from the site in 2000 (no contamination found). An active gas station is present 865 feet to the east (crossgradient) which has existed since approximately 1973. Known releases have occurred, as well as possible remediation based on an air permit related to vapor recovery; however, based on the distance, and inferred hydraulic direction, impacts to the LOD are unlikely.</p>

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Largo Branch 10251 Central Ave	30	FINDS/FRS, ICIS – The Maryland DMV located at this address received an administrative NOV in 2011 for unknown reasons. No other violations were found in regard to this facility. Based on the age this violation and no reports of an environmental releases, it is not considered a concern.	Low
3810, 3817	BP / Amoco Station # 2043 10604 Campus Way	865	<p>FINDS/FRS, ICIS, RCRA -SQG – NPDES non-major, active SQG, minor air permit.</p> <p>ERNS – Approximately 1-gallon gasoline was released when a driver drove off with a fueling line still in connected to their vehicle. The material was reportedly contained</p> <p>OCP, UST – This is an active gas station located directly south (upgradient) of the eastern portion of the LOD. The gas station currently has one 15,000-gallon diesel UST and one 15,000-gallon gasoline UST installed in 2016. In 2016, one 10,000-gallon and three 8,000-gallon USTs were excavated and removed from the site. Two 550-gallon UST was were excavated and removed in 2004. The facility has an active stage II vapor recovery air permit that was active from 2009 to at least 2015. There are five closed OCP cases associated with the gas station, three of which stated that there was a release and cleanup/ remediation occurred. According to files provided by MDE, a remediation system that included recovery wells was situated in the tank field in the northwestern portion of the gas station that extended into the eastern portion of the LOD. The facility requested permission from MDE to abandon the monitoring wells and recovery wells in 2004, which are associated with the tank field located in the northwestern portion of the site that had impacted soil and groundwater at the site. The files provided by MDE for this case were incomplete; however, since active remediation is believed to have occurred within the boundaries of the LOD, it highly likely that residual concentrations of petroleum constituents are present within the eastern portion of the LOD. Subsequently, during the removal of the three 8,000-gallon and one 10,000-gallon petroleum USTs from the tank field directly south of the eastern portion of the LOD in 2016, petroleum impacted soil above MDE cleanup levels and free product in the tank field monitoring wells was encountered. Over 1,100-tons of impacted soil was excavated and removed from the site; however, some impacted soil is believed to still be present at the site. MDE granted closure to the site based on the property and surrounding property's non-residential use and there were no current pathways of the exposure. Based on the information summarized above, it is possible that petroleum impacted soil and groundwater maybe present within the boundaries of the LOD.</p>	Low

<p>The LOD is located along the south side of Central Avenue (MD 214), west of Campus Way, in Upper Marlboro, Maryland. A shopping center and active gas station are located to the south (upgradient) of the LOD and have been present since at least 1973. Residential neighborhoods are located to the north and east. Based on database report findings and information provided by MDE through a PIA request, known releases have occurred at the gas station that required, free product recovery, source removal actions, and active remediation both onsite, as well as on the eastern portion of the LOD. No analytical data associated with the concentrations of petroleum constituents identified within the boundaries of the LOD; however, it is possible that residual contamination is still present. A shopping center directly to the south (upgradient) previously had a dry cleaner that conducted dry cleaning onsite. A 1,000-gallon heating oil UST was removed from the dry cleaning facility in May 2000 that was found to have not impacted soil or groundwater; however, impacts to the LOD from the dry cleaning operations conducted at the site cannot be fully ruled out. Several other facilities were listed as having RCRA permits and a 1,000-gallon heating oil UST was removed from the site in 2000 (no contamination found). Based on the documented releases associated with the gas station that is believed to have impacted the eastern portion of the LOD, as well as the potential for impacts from the former dry-cleaner south (upgradient) of the central portion of the LOD, further investigations are warranted to determine whether or not impacts from these two sites have impacted environmental media within the LOD.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Largo Branch 10251 Central Ave	30	FINDS/FRS, ICIS – The Maryland DMV located at this address received an administrative NOV in 2011 for an unknown reason. No other violations were found in regard to this facility. Based on the age this violation and no reports of an environmental releases, it is not considered a concern.	Low
2,5	BP/Amoco Station # 2043 10604 Campus Way	70	<p>FINDS/FRS, ICIS, RCRA -SQG – NPDES non-major, active SQG, minor air permit.</p> <p>ERNS – Approximately 1-gallon gasoline was released when a driver drove off with a fueling line still in connected to their vehicle. The material was reportedly contained</p> <p>OCP, UST – This is an active gas station located directly south (upgradient) of the eastern portion of the LOD. The gas station currently has one 15,000-gallon diesel UST and one 15,000-gallon gasoline UST installed in 2016. In 2016, one 10,000-gallon and three 8,000-gallon USTs were excavated and removed from the site. Two 550-gallon UST was were excavated and removed in 2004. The facility has an active stage II vapor recovery air permit that was active from 2009 to at least 2015. There are five closed OCP cases associated with the gas station, three of which stated that there was a release and cleanup/ remediation occurred. According to files provided by MDE, a remediation system that included recovery wells was situated in the tank field in the northwestern portion of the gas station that extended into the eastern portion of the LOD. The facility requested permission from MDE to abandon the monitoring wells and recovery wells in 2004, which are associated with the tank field located in the northwestern portion of the site that had impacted soil and groundwater at the site. The files provided by MDE for this case were incomplete; however, since active remediation is believed to have occurred within the boundaries of the LOD, it highly likely that residual concentrations of petroleum constituents are present within the eastern portion of the LOD. Subsequently, during the removal of the three 8,000-gallon and one 10,000-gallon petroleum USTs from the tank field directly south of the eastern portion of the LOD in 2016, petroleum impacted soil above MDE cleanup levels and free product in the tank field monitoring wells was encountered. Over 1,100-tons of impacted soil was excavated and removed from the site; however, some impacted soil is believed to still be present at the site. MDE granted closure to the site based on the property and surrounding property's non-residential use and there were no current pathways of the exposure. Based</p>	High

Ranking Rationale Site Summary		
<p>The LOD is located on the west side of Enterprise Road (MD 193), north of the intersection with Decesaris Boulevard, in Mitchellville, Maryland. The surrounding area is mixed-use composed of residential, agricultural, and vacant properties. The surrounding area and LOD were primarily developed as agricultural land up until the 1980s, when residential development began to the northwest and southeast. A school to the southwest was first observed in historical imagery in 2005, when the LOD and surrounding area was observed to be developed in its current configuration. The church located approximately 645 feet to the northeast, was constructed in approximately 1993. The church had two 1,000 gallon heating oil USTs that were excavated and removed from the site in 1998. According to available information, no impacts were identified during the UST removals; therefore, MDE granted closure for the USTs. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located within the central median of Largo Road (MD 202), north of the intersection with Mt Lubentia Way/Drumsheugh Lane, in Upper Marlboro, Maryland. The surrounding area is primarily developed with residential properties. The surrounding area had remained primarily vacant agricultural land up until the early 1980s, when residential properties began to be developed to the west. A church/private school was constructed to the southeast around 1973. The surrounding area we observed to be developed in its current configuration around 1993. Two facilities of concern were identified, the church/private school and a nursing home. In 2000, the church/private school excavated and removed two 8,000-gallon heating oil USTs. According to available information, one of the USTs was found to have impacted the surrounding subsurface area, which was addressed, and the case was closed several months later. A review of aerial photographs and the local topography indicate these former USTs were located approximately 300 feet east of the LOD. In 2017, a nursing home located approximately 335 feet to the north excavated and removed a 1,000-gallon diesel UST. The former UST was found to have impacted the surrounding subsurface area, which was addressed, and the case was closed several months later. Based on the local topography, both facilities are believed to be crossgradient from the LOD. Thus, impacts to the LOD are unlikely, based on the proximity of the sites relative to the LOD.</p>

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located within the central median of Largo Road (MD 202), north of Mt Lubentia Way/Drumsheugh Lane, in Upper Marlboro, Maryland. The surrounding area is primarily developed with residential properties. The surrounding area had remained primarily vacant agricultural land up until the early 1980s, when residential properties began to be developed to the west. Development continued through 1993, when the surrounding area were observed to be developed in its configuration. One record of concern, a church/private school located approximately 385 feet to the north, excavated and removed two 8,000-gallon heating oil USTs in 2000. According to available information, one of the USTs was found to have impacted the surrounding subsurface area, which was subsequently addressed and the case was closed shortly thereafter. Based on the local topography, this facility is believed to be crossgradient of the LOD, and is hydraulically separated from the LOD by an intermittent stream. Based on distance and inferred hydraulic direction, impacts to the LOD are unlikely.</p>

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Central Avenue (MD 214), west of Enterprise Road/Watkins Drive (MD 193), in Mitchellville, Maryland. The surrounding area was primarily rural agricultural land up until the 1980s. The shopping center immediately to the north was constructed in the early 1990s, and the surrounding area was observed in its current condition by 2005. Several environmental records were noted, most notably a former drycleaner and a gas station. The dry cleaner, located 400 feet to the north (upgradient), has no reported violations or releases. Based on distance from the LOD and no reported violations, impacts to the LOD from the dry cleaner are unlikely. The gas station, located 620 feet to the northeast, has documented releases including an OCP case for contaminated groundwater. However, based on local topography, the gas station is believed to be crossgradient of the LOD, as well as the LOD is hydraulically disconnected from the LOD by a stream running northeast to southwest. Thus, impacts to the LOD are unlikely.</p>

2	AUSTINS T J ROADHOUSE/ 12150 CENTRAL AVENUE	195	FINDS/FRS – Air permit; no violations were identified during this review.	Low
3	Central Cleaners 12110 Central Avenue Mitchellville, 20716	400	DRYCLEANERS, FED DRYCLEANERS, FINDS/FRS, RCRA-CESQG – The site has had an active air permit since 1993. No reported violations associated with the drycleaner were identified. The facility is approximately 400 feet north of the LOD. The drycleaner is believed to upgradient of the site.	Low
4	Duron Inc Store 149 12108 Central Ave	190	FINDS/FRS – RCRA generator; no violations were identified during this review.	Low
5	Mitchellville Radiology/ 12172 Central Ave	310	FINDS/FRS, RCRA-CESQG – Listed as a RCRA CESQG; no violations were identified during this review.	Low
3818	Sunoco Gas Station 12224 Central Avenue	620	FINDS/FRS, ICIS, RCRA-SQG – The site is an active gas station that is RCRA-CESQG and has a minor air permit; no violations were identified during this review. OCP, USTs – The site has four active USTs ranging in size from 8,000 to 12,000-gallons that were installed in 1993. There are two OCP cases associated with this site, one for a spill that occurred during the transfer of fuel into the USTs (closed in 2002 two months after it was opened) and the one associated with groundwater contamination. A stream is located directly south of the gas station; therefore, the gas station is believed to be crossgradient of the LOD.	Low

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Watkins Park Drive (MD 193), south of Central Avenue (MD 214), in Kettering, Maryland. The surrounding area is mixed use development. Residential apartments are located to the west and south, commercial and forested land to the north, and a shopping center to the east. The LOD and surrounding area were primarily forested and agricultural land up until the early 1980s, when Watkins Park Drive was constructed and residential development began to occur in the surrounding area. By 1988, the LOD and surrounding area were observed to be developed in their current configuration, when the shopping center to the east was constructed. An inactive drycleaner facility is located approximately 600 feet to the northeast of the LOD, in the shopping center. The former dry cleaner received several NOV's for air emissions in 2002; however, the issue was eventually resolved. Based on this info, impacts to the LOD from the former dry cleaner are unlikely.</p>

Street Address/Nearest Cross Streets	Central median of Largo Road (MD 202), west of Watkins Park Drive (193)	
City	Upper Marlboro	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
The LOD is located along the central median of Largo Road (MD 202), west of Watkins Park Drive (193), in Upper Marlboro, Maryland. The surrounding area is primarily residential, with the exception of a high school to the south of the LOD. The surrounding area was primarily rural vacant land up until approximately 1981, when the high school was constructed to the south. Residential development was observed to have occurred to the north beginning around 1993. The area was observed to be developed in its current configuration by 2006. Two SPILLS incidents occurred 420 feet and 500 feet west of the LOD, respectively. Both release are believed to be crossgradient of the LOD. In addition, the Bowie Trucking Service was flagged for having active USTs; however, this facility was determined to be located 1,900 feet to the south (downgradient). Thus, impacts to the LOD are unlikely based on the crossgradient and downgradient proximity of the sites relative to the LOD.

Ranking Rationale Site Summary		
<p>The LOD is located along the north side of Central Avenue (MD 214), west of Devonwood Drive/Jennings Mill Drive, in Kettering, Maryland. The surrounding area is primarily developed with residential properties, with the exception of a shopping center to the east of the LOD. The surrounding area was agricultural land up until 1993, when residential development was observed to have begun. Much of the surrounding area was developed in its current configuration by 2005. The shopping center to the northeast is believed to have been constructed between 2009 and 2013. Three petroleum release incidents were identified. The first incident, a release of 10 gallons of diesel fuel on the road surface about 85 feet from the LOD, occurred at the intersection of Central Avenue and Devonwood Drive. The release was cleaned up with sorbent dust, and the case closed. The second incident, a release of approximately 1 gallon of heating oil, approximately 260 feet south of the LOD, occurred during overfilling of a residential heating oil tank. The third incident, located 465 feet from the LOD and occurring in 1990, was closed 14 days after the date of incident. Based on the local topography, these site are believed to downgradient of the LOD. Based on the quantities involve, and inferred hydraulic gradient, impacts to the LOD from these incidents are unlikely.</p>

Quadrant:	NE	
Watershed:	PAX	
Street Address/Nearest Cross Streets	Central median of Central Avenue (MD 214), east of Jennings Mill Drive	
City	Bowie	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Central Avenue (MD 214), east of the intersection of Jennings Mill Drive, in Bowie, Maryland. The eastern portion of the LOD extends south across Central Avenue. The surrounding area is primarily residential, with some commercial and forest areas. The surrounding area was historically agricultural, with residential development starting in the 1980's and commercial development in the 2010's. Two OCP cases, one SPILLS case and one ERNS case was identified. The closest incident was an OCP case located 150 feet from the LOD, and is believed to be crossgradient of the LOD, based on the local topography. The case was opened and closed in February 1990, but no other info was available. The remaining incidents occurred at distances of 395 feet to 625 feet from the LOD, and believed to be either crossgradient or downgradient of the LOD. Based on the quantities involve, and inferred hydraulic gradient, impacts to the LOD from these incidents are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Capitol Homes Inc / 15011 Central Ave	150	OCP – Case No. 90-1661PG was opened and closed in February 1990, no further details available. Note: While the database mapped this site at 29 feet from the LOD, review of aerial images and County property information shows the site is located approximately 150 crossgradient from the LOD.	Low
2	Roadway / Central Ave & Devinwood	395	SPILLS – A spill of diesel fuel was reported in March 2017 as part of a motor vehicle accident. The accident and spilled material was reportedly cleaned up.	Low
3	My Place Seafood & Wings / 15231 Hall Rd, Ste 108	430	FIND/FRS – MD-TEMPO registration; no violations were identified during this review.	Low
4	Stogner Property / 15100 Hall Rd	567	OCP – Case No. 93-2240PG1 was opened in April 1993 and closed in November 1995. No further information available. Based on the local topography, the site is believed to be crossgradient of the LOD.	Low
5	15005 Central Ave	625	ERNS – A minor spill incident of less than 1 gallon of No. 2 fuel oil was reported when a home heating oil tank was overfilled. Based on the local topography, the site is believed to be downgradient of the LOD.	Low

Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Crain Highway (US Route 301), south of Peach Street, in Bowie, Maryland. The surrounding area is mixed use residential, commercial and open land. Based on a review of historical imagery, the LOD and surrounding area were observed to be agricultural and rural residential through the 1970s when increased residential development began to the west of the LOD. Residential development continued through the early 2000s when the LOD and surrounding area were observed to be developed in their current configuration. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Largo Road (MD 202), between Old Largo Road and Water Fowl Way, in Upper Marlboro, Maryland. The area to the west of the LOD is observed to be primarily agricultural, which has been since at least 1959. The area to the east of the LOD was primarily undeveloped woodlands until the early 2000's when residential development started to occur. The surrounding area was observed to be developed in its current configuration in 2005. The adjacent facility to the west was listed on the UST and OCP databases. A 500-gallon gasoline UST and a 1,000-gallon heating oil UST were removed in 1995. No reports of a release were noted. An OCP case was also opened in 1993 for unknown reasons, but was closed one month later. Although adjacent to the LOD, this facility is situated on a large plot of land. The closest structure to the LOD, which is the minimum distance where the USTs and operations would have occurred, is approximately 1,170 feet away. Based on this distance, impacts to the LOD from this facility are unlikely.</p>

<p>The LOD is situated along the eastern side of Crain Highway (US Route 301), north of the intersection with Leeland Road, in Upper Marlboro, Maryland. Commercial properties are located north and west of the LOD, and agricultural and forested areas to the south and east. The surrounding area was observed to be primarily agricultural land prior to commercial development beginning in late 1990's through mid-2010's. The surrounding area was observed to be developed in its current configuration in 2018. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Crain Highway (US Route 301), north of the intersection with Leeland Road, in Upper Marlboro, Maryland. Commercial properties are located north and west of the LOD, and agricultural and forested areas to the south and east. The surrounding area was observed to be primarily agricultural land prior to commercial development beginning in late 1990's through mid-2010's. The surrounding area was observed to be developed in its current configuration in 2018. The commercial property to the west, The Safeway Warehouse, was listed in Maryland FINDS/FRS database for having an air permit, being a conditionally exempt small quantity generator, and having a risk management plan. In addition, a SPILLS incident involving the release of 75 to 100 gallons of diesel occurred in 2019. The spill was cleaned up with the assistance of the local fire department using absorbent dust and pads. An additional SPILLS incident, a release of 25 gallons of diesel to the roadway along Leeland Road in 2016, went into a storm drain that led to a retention pond on the Safeway Warehouse property. An environmental response contractor was hired to address the release. The closest retention pond on the Safeway Warehouse property to the LOD is over 1,000 feet away. Based on this distances of these release incidents from the LOD, impacts to the LOD are unlikely.</p>

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Crain Highway (US Route 301), north of Beech Tree Parkway/ Swanson Road, in Upper Marlboro, Maryland. Forested land and a golf course are located north of the LOD; forested land, a golf course and a large residential subdivision to the west and southwest of the LOD; a hotel and church to the south; and agricultural lands and residential properties to the east of the LOD. The surrounding area was primarily agricultural up until the 1960's, when development began to occur. The surrounding area was observed to be developed in its current configuration around 2007. One record, an ERNS site associated with a release of 0.5 gallons of heating oil due to equipment failure, was mapped as being 189 feet from the LOD. However, further evaluation of this site identified the property to actually be 580 feet from the LOD. Based on the distance and amount reportedly released, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Crain Highway (US Route 301), south of Beech Tree Parkway/Swanson Road, in Upper Marlboro, Maryland. The southern end of the LOD extends east, across Crain Highway. Forested land and a golf course are located north and west of the LOD; a hotel and forested lands to the south of the LOD. The surrounding area was primarily agricultural up until the 1960's, when development began to occur. The surrounding area was observed to be developed in its current configuration around 2007. The hotel was identified in the environmental database reported as having a former UST and associated OCP case. In December 2003, a 2,000-gallon heating oil UST was removed from the site. A release was reported to have not occurred. In April 2004, a leak from a heating oil AST of unknown volume occurred. Cleanup activities were reported to have occurred and the case was closed 2 months later. The site was listed as being 210 south of the LOD; however, after further review the site is approximately 300 south of the LOD. Based on the local topography, the site is believed to be downgradient of the LOD. Based on this, impacts to the LOD are unlikely from this facility. Three other facilities were identified in the database; however, further evaluation determined these facilities to be incorrectly mapped as being near the LOD. Actual distances of these facilities to the LOD ranged between 800 and 1,100 feet. Thus, impacts from these site are unlikely based on their distance.</p>

Street Address/Nearest Cross Streets	East side of Woodyard Road (MD 223), north of Dower House Road	
City	Woodyard	
County	Prince George's	
Type of property	ROW/Private Property	
Ranking Rationale Site Summary		
<p>The LOD is located along the eastern side of Woodyard Road (MD 223), north of Dower House Road, in Woodyard, Maryland. The surrounding area is primarily residential properties with some commercial and institutional properties along Woodyard Road. The LOD and surrounding area was primarily agricultural up until the 1980's, when residential development began. The surrounding area was observed to be developed in its current configuration around 2007. A former gas station is located approximately 145 feet west of the LOD. In 1996, one 8,000-gallon gasoline UST, one 6,000-gallon gasoline UST, two 2,000-gallon gasoline USTs, one 550-gallon kerosene UST, and one 550-gallon used oil UST were excavated and removed from the site in February 1996. Substantial amounts of impacted soil and free product were observed in the kerosene excavation pit on the southwest side of the site, as well as in the excavation pit that had contained the two 2,000-gallon gasoline USTs, in the north-central portion of the site. Based on additional sampling onsite and offsite, elevated levels of TPH, MTBE, BTEX were identified in the soil and groundwater onsite. Groundwater modeling inferred that a groundwater plume extended to the north, into the southern portion of property directly east of the site and west of the LOD, with concentrations of benzene, toluene, ethylbenzene, and xylenes all detected above their laboratory detection limits. Based on available reports, the local hydraulic gradient is believed to be to the northeast, crossgradient of the LOD. A pump and treat system was installed in approximately 1997 and continued to be operated until approximately May 1998. The seven onsite permanent monitoring/ recovery wells were sampled gauged monthly and then quarterly up until March 2000, when detected concentrations of TPH and BTEX were found to have substantially decreased. In August 2000, MDE granted no further action to the site. Based on the information summarized above it is believed that any impacted soil and/or groundwater is isolated to the area around the former gas station or to the north/northeast of the site, and west (crossgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>

LOD ID: PAX-0616	Site Rank: Low	Figure Location: 
Quadrant:	SE	
Watershed:	PAX	
Street Address/Nearest Cross Streets	Central median of Southern Maryland Boulevard (MD 4), east of Plummer Lane	
City	Lothian	
County	Anne Arundel	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Southern Maryland Boulevard (MD 4), east of Plummer Lane, in Lothian, Maryland. A portion of the LOD extends north, across the roadway. The surrounding area is a mix of rural agricultural land, vacant land, and forested land. The surrounding area is observed to be in its current configuration by 2005. One record of concern was identified in the environmental data base report. A SPILLS case involving the discovery of a 55-gallon drum of unknown substance and a 30-gallon drum of waste oil was identified approximately 150 feet of the LOD; however, after further review, the incident is believed to have occurred approximately 1,250 feet to the northeast of the LOD. Thus, impacts to the LOD are unlikely.</p>

Type of property	ROW	
Ranking Rationale Site Summary		
The LOD is located along the central median of Crain Highway (US Route 301), southwest of the intersection with Old Crain Highway, in Upper Marlboro, Maryland. A high voltage transmission ROW cuts across the northeastern portion of the LOD. The surrounding area is comprised of commercial and residential properties intermixed with agricultural and forested areas. The area was primarily agricultural and forested land up until 2005, when residential development began to the north. The surrounding area was observed to be developed in its current configuration in 2009. No records of concern were identified in the vicinity of the LOD during this environmental review.

Watershed:	PAX	
Street Address/Nearest Cross Streets	North side of W Bay Front Road (MD 258), east of McKendree Road	
City	Lothian	
County	Anne Arundel	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the north side of W Bay Front Road (MD 258), immediately east of McKendree Road, in Lothian, Maryland. The surrounding area is primarily rural agricultural land with some residential properties. The surrounding area has been primarily used for agricultural purposes since at least 1954, and is observed in its current configuration by 1993. Three records of concern were identified in the environmental database report, with the closest being a former UST site believed to be approximately 230 feet upgradient or crossgradient of the LOD. According to available records, a 1,000-gallon diesel fuel UST, was removed in 1992. No records stating a release occurred was noted. Thus, impacts to the LOD from this former UST are unlikely. The remaining two records, a HMIRS/SPILLS site and a UST/OCP site, are both believed to be located between 295 and 505 feet downgradient of the LOD. Thus, impacts to the LOD are unlikely based on the distances of these sites.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Alice Springs/ 336 W Bay Front Road Lothian, MD	230	<p>UST – Previously, a 1,000 gallon diesel UST was operated at the site. The tank was closed via excavation/removal in 1992. No documented releases are associated with this UST. Based on local topography the site is believed to be upgradient or crossgradient of the LOD.</p> <p>Note: While the database mapped this facility at 120 feet from the LOD, actual distance is approximately 230 feet.</p>	Low
2	Greenstreet Growers Inc/ 391 W Bay Front Road Lothian, MD	295	<p>HMIRS – In 1998, a release of one gallon of heating oil occurred due to a power outage. The release was contained and cleaned up.</p> <p>SPILLS – In 2017, a release of between 10 to 20 gallons of No. 2 heating oil occurred from a leaking AST. A tank technician was mobilized and the remaining fuel in the AST pumped out.</p> <p>Based on the local topography, the site is believed to be downgradient of the LOD.</p>	Low
3	Mordie Spriggs Property/ 282 W Bay Front Road Lothian, MD	505	<p>UST, OCP – In 1994, a 1,000-gallon diesel fuel UST was closed via excavation/removal. It is unknown whether a release occurred, but the OCP case was closed the same day it was opened.</p> <p>Based on the local topography, the site is believed to be downgradient of the LOD.</p>	Low

City	Lothian	
County	Anne Arundel	
Type of property	ROW	
Ranking Rationale Site Summary		
The LOD is located along the northern side of W Bay Front Road (MD 258), between Anthony Court and Dawn Drive, in Lothian, Maryland. The surrounding area is semi-rural with residential properties. The surrounding area was historically agricultural, starting prior to 1953. Residential development in the surrounding area continued to approximately 2005, when the surrounding area was observed to be developed in its current configuration. Four sites were identified in the environmental database report. Of those four sites, only two sites had listings associated with petroleum USTs or reported releases; however, the two sites are believed to be at least 370 feet downgradient of the LOD. Thus, impacts are unlikely.

<p>The LOD is located along the east side of Croom Road (MD 382), north of Molly Berry Road, in Upper Marlboro, Maryland. The area surrounding the LOD is mostly rural agricultural and forest land, with residential structures and farms to the northeast and south. No substantial changes to the surrounding are noted since the 1960s. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

Watershed:	PAX	
Street Address/Nearest Cross Streets	Central median of Crain Highway, south of Frank Tippet Road	
City	Cheltenham	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Crain Highway (US Route 301), south of Frank Tippet Road, in Cheltenham, Maryland. The surrounding area is primarily residential properties, forested land, as well as cemetery to the west and retail structures to the north. The surrounding area was primarily rural agricultural land up until the 1980s, when development began to occur to the west, including the construction of a cemetery to the west. The surrounding area was observed to be developed in its current configuration around 1993. The cemetery was identified in the environmental database for having former USTs. During removal of a 1,000-gallon heating oil UST, impacted subsurface media was encountered. The material was remediated and the case was closed. The anticipated location of the former USTs is approximately 605 feet from the LOD. Further, the cemetery is anticipated to be hydraulically downgradient of the LOD. Based on this, impacts to the LOD from the cemetery are unlikely. A convenience store located approximately 635 feet to the northeast (crossgradient) that previously had petroleum USTs located on the property. There are no records of releases associated with the former UST. Thus, impacts from these sites are unlikely based on their downgradient and crossgradient proximity to the LOD.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Maryland Veterans Cemetery/ 11301 Crain Hwy	605	OCP, UST – The cemetery reportedly had four petroleum USTs (One 2,000-gallon heating oil UST, one 1,000-gallon heating oil UST, one 1,000-gallon gasoline UST, and 1,000-gallon diesel UST). All four USTs were closed between 1993 and 2012. The most recent UST closure was associated with the 1,000-gallon heating oil UST, which reportedly was found to have impacted subsurface media. The material was remediated and the case was closed approximately 1 year later in 2013. The site is listed as being 90 feet northeast of the LOD; however, based on aerial imagery, the closest structure that a heating oil UST would be located adjacent to is approximately 605 feet to the west (downgradient) of the LOD.	Low
2	W. C. Hicks Store Route 301 South at Frank Tippet Road	635	The property had two 1,000-gallon gasoline and one 500-gallon gasoline USTs that were excavated and removed in 1988. An OCP case associated with the closure of the USTs was opened in 1988 and closed in 1994. No records of releases or spills associated with these UST were identified in the available records. The site appears to be crossgradient of the LOD.	Low

Ranking Rationale Site Summary		
The LOD is located along the central median of Southern Maryland Boulevard (MD 4), north of Camaleer Pass and south of Lord Baltimore Drive, in Owings, Maryland. The surrounding area is primarily agricultural land, residential and undeveloped woodlands. The surrounding area was primarily undeveloped up until the 1980s, when residential and some commercial development began. Development continued through 2005, when the surrounding area was observed to be developed in its current configuration. No records of concern were identified in the vicinity of the LOD during this environmental review.

Street Address/Nearest Cross Streets	Central median of Three Notch Road (MD 5), south of Carpenter Lane	
City	Charlotte Hall	
County	St. Mary's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Three Notch Road (MD 5), south of Carpenter Lane, in Charlotte Hall, Maryland. The surrounding area consists of commercial development and forest; with a dentist, cabinetry business, and farm stand located directly adjacent to LOD. The surrounding area was primarily agricultural up until the 1970s, when commercial development began, and continued through 2006, when the surrounding area was observed to be development similar to its current configuration. The cabinetry business, Cords Carpentry, is a RCRA SQG, with no violations on record. Two other sites were identified in the environmental database search for having NPDES permits; however, impacts to the LOD are unlikely based on the nature of the listings.</p>

Ranking Rationale Site Summary		
The LOD is located on the west side of Aquasco Road (MD 381), approximately 2,500 feet south of Christ Church Road, in Aquasco, Maryland. The southern end of the LOD extends east, across Aquasco Road. The surrounding area is observed to be undeveloped forest and agricultural fields. Based on a review several structures and agricultural field were present along Aquasco Road up until the 1980s, when forests were observed to reclaim the farmland and the structures had been demolished. No substantial changes to the surrounding area were observed since 1980, based on a review of available historical imagery. No records of concern were identified in the vicinity of the LOD during this environmental review.

City	Charlotte Hall	
County	St. Mary's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Three Notch Road (MD 5), north from the intersection with Carpenter Lane in Charlotte Hall, Maryland. The surrounding area consists of commercial development and forest; with a shed sales business to the northeast, a farm supply store to the west, shopping center to the northeast, dumpster and U-Haul rentals to the east, dentist to the southwest, and cabinetry business to the southeast. These businesses were developed in the 1970's to 2000's. A FINDS/FRS record for a gas station 185 feet to the north was identified, however, based on further review the site is not located in the vicinity of the LOD. Cords Carpentry to the southeast is a RCRA SQG, with no violations or record, it presents a low risk site. Two other sites were identified in the environmental database search for having NPDES permits. Thus, impacts are unlikely based on the nature of the environmental listings identified in the vicinity of the LOD.</p>

Street Address/Nearest Cross Streets	East side of Hallowing Point Road (MD 231), south of Calvert Fair Drive	
City	Prince Frederick	
County	Calvert County	
Type of property	ROW/County	
Ranking Rationale Site Summary		
<p>The LOD is located along the east side of Hallowing Point Road (MD 231), south of Calvert Fair Drive, in Prince Frederick, Maryland. A gas station is located approximately 450 feet south (crossgradient) of the LOD. An autobody shop was mapped approximately 150 feet to the north of the LOD; however, after further review, the site is actually 450 feet away to the south (downgradient) and presents no risk. An OCP case was opened in 2012, at a property approximately 75 feet to the west of the southern portion of the LOD, beyond Hallowing Point Road after a pickup truck overturned releasing an unknown amount of diesel onto the lawn of the property and impacted an approximately 10 foot by 30 foot area of grass. PID readings from the area were recorded between 25 and 78 ppm. The area was excavated approximately 4-6 inches bgs, graded with topsoil from offsite and reseeded. The case was closed shortly thereafter. Since the impacted area was mostly surficial and approximately 75 feet to the west, beyond Hallowing Point Road, impacts to the LOD are unlikely.</p>

Quadrant:	NE	
Watershed:	PAX	
Street Address/Nearest Cross Streets	South side of John Hanson Highway (US Route 50), west of Lottsford Vista Road	
City	Bowie	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
The LOD is located along the south side of John Hanson Highway (US Route 50), west of Lottsford Vista Road, in Bowie, Maryland. Based on historical imagery, the surrounding area was primarily agricultural and forested land up until the 1960s, when single family residential properties began to be developed to the south, an office park to the northwest was developed in the 1980's, and multifamily residential complexes to the northeast were developed in the 1990's. The surrounding area was observed to be developed in its current configuration around 2009. No records of concern were identified in the vicinity of the LOD during this environmental review.

Street Address/Nearest Cross Streets	North side of John Hanson Highway (US Route 50), west of the Enterprise Road overpass	
City	Bowie	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the north side of John Hanson Highway (US Route 50), west of the Enterprise Road overpass, in Bowie, Maryland. Based on historical imagery, the surrounding area was primarily agricultural and forested land up until the 1980s, when residential development began to occur. Residential development continued in directions of the LOD through the mid-1990s, when the surrounding area was observed to be developed in its current configuration. An OCP case was opened for an unknown reason at a residential property approximately 535 feet north of the LOD. Based on the local topography, the site is believed to be upgradient of the LOD; however, available records state that no release had occurred and not cleanup/remediation was required. The case was closed approximately 3 months later. Thus, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	East side of Enterprise Road (MD 193), south of Belvidere Road	
City	Bowie	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the eastern side of Enterprise Road (MD 193), immediately south of Belvidere Road, in Bowie, Maryland. The surrounding area is primarily residential. The surrounding area was primarily agricultural and scattered residential properties as early as 1961. Additional residential development was observed to the south in early 1970s. Residential development continued to the east, west, and south through the early 1980s, when the surrounding area was observed to be developed in its current configuration. The John Hanson Highway (US Route 50) overpass, located approximately 625 feet to the north was listed on the RCRA LQG, and SPILLS databases. The overpass is most likely listed as an LQG for lead most likely generated from lead-abatement during bridge rehabilitation. In 2014, a release of 30 gallons of diesel fuel due to an overturned tanker truck. The Prince George's Hazardous Materials Department was mobilized. In 2017, a release of two gallons of gasoline occurred due to a vehicle accident. Prince George's Fire Department was mobilized, which used absorbent dust to address the spill; however, based on the distance, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	West side of Glenn Dale Road (MD 953), north of Atwell Avenue	
City	Bowie	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Glenn Dale Road (MD 953), north of the intersection with Atwell Ave, in Bowie, Maryland. The LOD is surrounded by residential developments, with the closest residential developments occurring in the 2000s (west of LOD) and the early 1990s (east of LOD). In addition, a shopping center complex constructed in the 1990s is located to the northeast. Prior to the 1990's, the surrounding area was observed to be primarily agricultural and forested land. The shopping center was flagged as having a drycleaner (no violations) as well as a SPILLS incident involving sewage only. Further evaluation identified that the dry cleaner is located further back in the shopping center plaza, increasing the distance from the LOD to just over 400 feet. Based on the local topography, the site is believed to crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	South side of Lanham Severn Road (MD 564), east of Santa Cruz Street	
City	Lanham	
County	Prince George's	
Type of property	Row	
Ranking Rationale Site Summary		
<p>The LOD is located along the south side of Lanham Severn Road (MD 564), east of Santa Cruz Street, in Lanham, Maryland. The LOD is directly west of Lanham Skate Center. The area north of LOD is primarily residential; developed by 1960; the area to the southwest is primarily commercial properties, developed in the 1970's-1980's; the area to the west and east of the LOD is forested land. South of the commercial area is a railroad line, followed by residential development. Three sites were identified in the environmental database search, including two RCRA SQGs with no violations located 400-500 feet from the LOD, as well as an OCP/UST site approximately 595 feet to the southwest that had a reported release/cleanup from a single UST. All three sites are believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

Watershed:	PAX	
Street Address/Nearest Cross Streets	Between Annapolis Road (MD 45) and the offramp to Cipriano Road	
City	Lanham	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located between Annapolis Road and the offramp from Annapolis Road (MD 45) onto Cipriano Road, in Lanham, Maryland. The surrounding area is primarily commercial developments with some residential complexes. Commercial and residential development is observed to begin prior to 1964. The surrounding area is observed in its current configuration by 1988. A site located approximately 85 feet north of the LOD formerly had a dry cleaning operation located onsite, as well as a gas station located directly northwest. Subsurface investigations identified elevated levels of chlorinated solvents and petroleum constituents/additives in soil and groundwater onsite. PCE was detected as high as 640 ug/l, TEC at 270 ug/l, cis-1,2-DCE at 98 ug/l, Vinyl Chloride at 140 ug/l. The site received NFRD in 2003, with land-use restrictions including use of groundwater onsite. Based on the local topography, groundwater is believed to flow to the southwest, potentially towards the LOD; therefore, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwater to determine if environmental media within the LOD have been impacted.</p>

City	Bowie	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Laurel Bowie Road (MD 197), north of Race Track Road, in Bowie, Maryland. The surrounding area is primarily forested with some residential structures to the west. Residential development began prior to 1964, and the surrounding area is observed in its current configuration by 2005. One record of concern, an OCP and UST site located 475 feet to the west, has soil contamination that was identified during removal of a 550 gallon heating oil UST. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	West side of Laurel Bowie Road (MD 197), across Jericho Park Road	
City	Bowie	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Laurel Bowie Road (MD 197), across from the intersection with Jericho Park Road, in Bowie, Maryland. The surrounding area is mainly forest to the west, south and east, while the Bowie State College is to the north and northeast. Construction of the college began prior to 1964 and several expansions have occurred since. The surrounding area is observed to be in its current configuration by 2011. Bowie State College was listed on the OCP, UST, FINDS/FRS databases. Four OCP cases were opened, two of which involved cleanup efforts, and fourteen USTs were previously registered as being present. While the college was mapped as being 335 feet from the LOD, based on the size of the campus, these cases are likely located significantly further. In addition, based on local topography the campus is located downgradient from the LOD. Two other sites with OCP cases and reported spills in the vicinity of the LOD, were identified in the environmental database report; however, after further review, the sites were over 1,400 feet from the LOD. Thus, impacts to the LOD from the college campus and other sites are unlikely.</p>

Ranking Rationale Site Summary		
The LOD is located along the western side of Laurel Bowie Road (MD 197), north of the intersection with Jericho Park Road, in Bowie, Maryland. The surrounding area is primarily forested land. MD 197 is observed to be completed by 1993, with no other development in the vicinity of the LOD since. A minor spill incident of 5 gallons of hydraulic oil occurred 605 feet to the south, which was subsequently addressed. The remaining records appear to be associated with a landfill located approximately one mile to the west. Thus, impacts to the LOD are unlikely.

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located on the east side of 9th Street, north of 11th Street, and south of a railroad, in Bowie Maryland. Based on aerial photographs the portion of the LOD The LOD consists of the northbound lane of 9th St., mostly grassy land to the east of the street, and a pedestrian walkway connecting form 9th Street to nearby 10th Street. The area surrounding the LOD is mostly residential, with some commercial located along Chestnut Avenue. The area was mostly developed by the 1930's; the LOD was developed into existing condition along with the construction of 9th Street in the late 1990's or early 2000's. Several buildings, likely residential, were located within the LOD and demolished by 1993. Eight closed UST/OCP sites were identified around the LOD. Seven of the sites were found to be either upgradient/crossgradient of the LOD, no releases/ remediation was required, and are not believed to have impacted the LOD. Other low risk sites included a RCRA SQG with no violations and a restaurant that holds an active air permit. One OCP case was identified directly west of the southern portion of the LOD. According to available information provided by MDE through a PIA request, a 550-gallon gasoline UST was excavated and removed from the site in 1993. No staining or odors were observed in the soils in the excavation, as well as PID readings were recorded at 0.0 ppm. A soil sample was collected and analyzed for TPH, naphthalene, and BTEX, which were all non-detect with the exception of a detected concentration of naphthalene at 0.003 mg/kg. Base on the analytical data, MDE granted closure to the site approximately 7 months later. Thus, impacts to the LOD are unlikely.</p>

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	State Highway Admin Property 8607 Chestnut Ave.	5	OCP – In 1993, a 550-gallon gasoline UST was excavated and removed from the site. No staining or odors were observed in the soils in the excavation, as well as PID readings were recorded at 0.0 ppm. A soil sample was collected and analyzed for TPH, naphthalene, and BTEX, which were all non-detect with the exception of a detected concentration of naphthalene at 0.003 mg/kg. Base on the analytical data, MDE granted closure to the site approximately 7 months later.	Low
2	Old Bowie town Grill 8604 Chestnut Ave.	105	FINDs/FRS – Air permit associated with a restaurant; no violations were identified during this review.	Low
3	Amtrack Bowie Substation #23 End of 11 th St at Chestnut Ave	700	FINDs/FRS, RCRA SQG – This facility is a RCRA small quantity generator of lead; no violations were identified during this review. Based on further review, the facility is approximately 700 feet to the west of the LOD. Based on the local topography, the site is believed to be crossgradient of the LOD.	Low
4	Antique Store, House of Hegedus 8521 Chestnut Ave.	115	OCP, UST – This site had a single 550-gallon heating oil tank installed in 1970 and removed in March 1999. The OCP case for the closure does states that no impacted material was encountered during the removal of the UST. The case was closed approximately 1 month later. Based on the local topography, the site is believed to be downgradient of the LOD.	Low
5	Old Bowie Fire Dept #19 3100 9 th St @ Chestnut Ave.	195	OCP – Closed 1985 OCP case, no release/cleanup indicated. The case was closed the same day. Based on the local topography, the site is believed to be downgradient of the LOD.	Low
6	Unknown 13039 9 th St.	350	OCP – An OCP case was opened in May 1988 at the property located approximately 350 feet downgradient of the LOD, not 240 as reported by ERIS. Records do not indicate whether a release occurred or cleanup/remediation was required. The case received closure in January 1989.	Low
7	Henson Residence 13118 11 th St.	280	OCP – An OCP case was opened in October 1999 case for a residential AST heating oil leak. According to available information, the impacted material was addressed and the case was closed approximately 1 month later. This site is located upgradient from the LOD; however, the release was most likely surficial since the release is associated with an AST. Based on the local topography, the site is believed to be crossgradient of the LOD.	Low

Ranking Rationale Site Summary		
<p>The LOD is located along the interchange from westbound Sandy Spring Road (MD 198) and southbound I-95, in Laurel, Maryland. The area surrounding the LOD was observed to be primarily forested and agricultural land up until 1971, when MD 198 and I-95 were first observed. With the exception of forested areas returning following MD 198 and I-95 construction, the area has remained relatively unchanged since at least 1971. No records of concern were identified in the vicinity of the LOD during this environmental review.</p>

Street Address/Nearest Cross Streets	Along interchange from I-95 northbound to Sandy Spring Road (MD 198) eastbound	
City	Laurel	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
The LOD is located along the south bound onramp of I-95 from Sandy Spring Road (MD 198), in Laurel, Maryland. The area surrounding the LOD was observed to be primarily forested and agricultural land up until 1971, when MD 198 and I-95 were first observed. With the exception of forested areas returning following MD 198 and I-95 construction, the area has remained relatively unchanged since at least 1971. No records of concern were identified in the vicinity of the LOD during this environmental review.

Street Address/Nearest Cross Streets	Central median of Sandy Spring Road (MD 198), west of I-95 overpass	
City	Laurel	
County	Prince George's	
Type of property	Median/ROW	
Ranking Rationale Site Summary		
<p>The LOD resides mainly within the central median of Sandy Spring Road (MD 198), west of the I-95 overpass, in Laurel, Maryland. Residential properties are observed to the north of the LOD and forested lands and a hotel parking lot to the south. The area was primarily agricultural with few residential properties until the late 1960s, when the area was cleared for the construction of I-95 and Sandy Spring Road. By 1989, the area was developed into current conditions. Two SPILLS incidents were identified in the vicinity of the LOD; a release of four ounces of oil approximately 95 feet to the north, and a release of approximately 10 gallons of gasoline 315 feet to the north. Both releases were surficial in nature and are believed to be crossgradient of the LOD. In addition, two UST/OCP sites were identified; one for the removal of a 550-gallon heating oil UST approximately 210 feet to the east, and one for the removal of two 4,000-gallon diesel fuel USTs, one 2,000-gallon gasoline UST and an unknown sized motor/lube oil tank approximately 380 feet to the east. Cleanup efforts were required at both of these UST/OCP sites; however, based on the local topography, both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD from these four sites are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD lies on the north side of Sandy Spring Road (MD 198), just west of the offramp from I-95 south in Laurel, Maryland. Residential properties are observed to the north of the LOD and forested lands and a hotel parking lot to the south. The area was primarily agricultural with few residential properties until the late 1960s when the area was cleared for the construction of I-95 and Sandy Spring Road. By 1989, the area was observed to be developed in its current configuration. Two SPILLS incidents were identified in the vicinity of the LOD; a release of four ounces of oil approximately 25 feet to the north, and a release of approximately 10 gallons of gasoline 255 feet to the north. Both releases were surficial in nature and are hydraulically crossgradient of the LOD. In addition, two UST/OCP sites were identified; one for the removal of a 550-gallon heating oil UST approximately 210 feet to the east, and one for the removal of two 4,000-gallon diesel fuel USTs, one 2,000-gallon gasoline UST and an unknown sized motor/lube oil tank approximately 385 feet to the east. Cleanup efforts were required at both of these UST/OCP sites; however, based on the local topography, both sites are believed to be downgradient of the LOD. Thus, impacts to the LOD from these sites are unlikely.</p>

Project Area Site Descriptions

LOD ID: PAX-2518	Site Rank: Low	Figure Location:
Quadrant:	NE	
Watershed:	PAX	
Street Address/Nearest Cross Streets	Central median of Sandy Spring Road (MD 198), west of Van Dusen Road	
City	Laurel	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Sandy Spring Road (MD 198), west of the intersection with Van Dusen Road, in Laurel, Maryland. The area surrounding the LOD is densely populated with residential properties to the south and commercial properties to the north. The area was primarily forested land until the early 1970s, when Sandy Spring Road and residential properties to the south and west were constructed. The surrounding area was observed to be developed in its current configuration around 1981. Two OCP cases related to vehicular accidents occurred approximately 50 feet to the east, at the intersection of Sandy Spring Road and Van Dusen Road. Based on the descriptions, both likely were minimal releases to the impervious road surface only. An active gas station, located 275 feet to the northeast, is listed on the SPILLS, UST, and OCP databases. Three gasoline and one diesel UST exist. An OCP case was opened in 1993 for the removal of two used oil USTs. Release and cleanup efforts were noted, and the OCP case closed in 2000. In 2015, a hose failure released an unreported volume of gasoline to the surface. A dry cleaner was noted 387 feet to the north, which had no reported violations. An additional OCP case was noted 393 feet to the north, at a realty broker's office, for the removal of a 500-gallon heating oil UST that required subsequent cleanup efforts. The gas station, dry cleaner and realty broker sites are believed to be located hydraulically crossgradient from the LOD. Based on the hydraulic direction and the distances from the LOD, impacts to the LOD from the gas station dry cleaner and realty broker are unlikely. The remaining records are listed at sites 405 feet or greater from the LOD and therefore, are not expected to have an impact on the LOD.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the south side of Sandy Spring Road (MD 198), east of Van Dusen Road, in Laurel, Maryland. Residential properties are located to the south and commercial properties to north side. Sandy Spring road was rerouted in the early 1970s to its current configuration, when residential and commercial development was also observed to begin. The surrounding area was observed to be developed in its current configuration around 1989. Four sites concern were identified in area surrounding the LOD. Two OCP cases related to vehicular accidents occurred approximately 90 feet to the west, at the intersection of Sandy Spring Road and Van Dusen Road. Based on the descriptions, both likely were minimal releases to the impervious road surface only. An active gas station, located 385 feet to the northeast (crossgradient), is listed on the SPILLS, UST, and OCP databases. Three gasoline and one diesel UST exist. An OCP case was opened in 1993 for the removal of two used oil USTs. Release and cleanup efforts were noted, and the OCP case closed in 2000. In 2015, a hose failure released an unreported volume of gasoline to the surface. A fourth OCP case was plotted approximately 510 feet to the east of the LOD; however, based on further review, the site is actually 730 feet to the northeast (downgradient) of the LOD. Based on the crossgradient/downgradient proximity of the sites relative to the LOD, impacts are unlikely.</p>

Street Address/Nearest Cross Streets	North side of Sandy Spring Road (MD 198), west of 11 th Street	
City	Laurel	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the north side of Sandy Spring Road (MD 198), west of 11th Street, in Laurel, Maryland. The area surrounding the LOD is densely populated with residential properties to the south and commercial properties to the north. The area was primarily forested land until the early 1970s, when Sandy Spring Road and residential properties to the south and west were constructed. The surrounding area was observed to be developed in its current configuration around 1981. An OCP case related to dumping was listed at a site approximately 580 feet to the north of the LOD. Records state that no release was identified and therefore, required no cleanup/ remediation. The case was closed approximately 1 week later. Based on the distance and lack of release, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is along the central median of Gorman Avenue (MD 198), west of 10th Street and east of 11th Street, in Laurel, Maryland. The area surrounding the LOD is primarily residential, with several commercial buildings further to the north. Residential development began to the south in the 1950s and continued to the north in the 1970s, when multi-family residential complexes were constructed. The LOD and surrounding area were observed to be developed in their current configuration in approximately 2005. A spill and OCP case associated with a residential property are listed approximately 485 feet to the west of the LOD. Based on available information, approximately 200 gallons of heating oil was released onto the ground from, due to a hole in an AST. An OCP case was opened in relation to this release in November 2016, that stated the impacted material was addressed, and the case was closed approximately two years later in June 2018. Based on local topography the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely based on the distance of the site.</p>

Ranking Rationale Site Summary		
<p>The LOD is located in the median of Gorman Avenue (MD 198), west of the intersection with 10th Street, in Laurel, Maryland. This area is primarily residential and has been since the 1960s. The surrounding area was observed to be developed in its current configuration around 1971. A SPILL incident that was eventually changed to an OCP case, occurred approximately 85 feet to the north of the LOD. The incident involved the release of approximately 200 gallons of heating oil from an AST onto the ground in 2016. A remediation contractor was mobilized who removed the leaking AST and approximately two tons of impacted soils. Excavation occurred until PID readings of less than 20 ppm were detected. A confirmatory soil sample was collected at the base of the excavation for laboratory analysis of TPH-DRO, TPH-GRO and VOCs. Analytical results were non-detect, except for TPH-DRO and xylenes; however, the detected concentrations were all well below the MDE Residential Soil Cleanup Objectives. The OCP case was closed in June 2018. Based on this information, impacts to the LOD are unlikely.</p>

1	Aaron Jolly Residence 621 Tenth St	85	SPILLS, OCP – In November 2016, a release of approximately 200 gallons of heating oil occurred from a leaking AST. An OCP case was subsequently opened due to the need for remediation. On November 28, 2016, Petroleum Management, Inc. (PMI) removed the AST and excavated the impacted soils until PID readings <20ppm were detected. An excavation area approximately 4' x 5' x 30" deep incurred, resulting in approximately 2 tons of petroleum-impacted soils being disposed of. A confirmatory soil sample was collected from the bottom of the excavation and analyzed for TPH-DRO, TPH-GRO and VOCs. Results were non-detect for all analytes except TPH-DRO (33.6 mg/Kg) and xylenes (0.005 mg/Kg). These detections were well below the applicable MDE Residential Soil Cleanup Standards. MDE closed the OCP case in June 2018.	Low

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1963	Gorman Avenue is present, but as a 2-lane road. Residential properties are located to the northeast and south. The area to the northwest of the LOD appears to be cleared vacant land.	Aerial
1971	Gorman Avenue is now visible as a 4-lane divided highway. The previously vacant land to the northwest has been developed with a large commercial structure.	Aerial
2009	The surrounding area is observed in its current configuration.	Aerial

Ranking Rationale Site Summary		
<p>The LOD is located along the north side of Fort Meade Road (MD 198), east of Laurel Bowie Road (MD 197), in Laurel, Maryland. The area surrounding the LOD is developed primarily with commercial properties. The LOD and surrounding area was observed to be vacant land up until 1952, when Fort Meade Road is first observed to the south of the LOD. In 1971 the commercial properties to the north of the LOD were first observed. Commercial development in the area continued up until 2005 when the LOD and surrounding area were observed to be developed in their current configuration. Four sites within 120 to 420 feet of the LOD are listed at RCRA generators or have air permits (no violations). One apartment complex to the approximately 450 feet to southwest (downgradient) has an active 10,000-gallon heating oil UST and one 12,000-gallon heating UST that was excavated and removed the from the site 1987. According to available records, no impacted material was encountered and/or cleanup/ remediation was required during the removal of the UST. Subsequently, the case was closed approximately 2.5 months later. Thus, impacts to the LOD are unlikely, since the USTs and associated apartment complex are believed to be downgradient of the LOD.</p>

Watershed:	PAX
Street Address/Nearest Cross Streets	South side of Laurel Fort Meade Road (MD 198), east of Red Clay Road
City	Laurel
County	Anne Arundel
Type of property	ROW/Private
Ranking Rationale Site Summary	
<p>The LOD is located along the south side of Laurel Fort Meade Road (MD 198), west of Red Clay Road, in Laurel, Maryland. The surrounding area is primarily developed with commercial properties with residential properties located further to the north and south. The area surrounding the LOD was primarily forested land up until 1970, when much of the area was cleared for commercial development. Commercial development and residential development continued through 2005, when the surrounding area was observed to be developed in its current configuration. There is a gas approximately 330 feet northeast of the LOD, as well as a second gas station approximately 425 feet to the east of the LOD. Both gas stations have reported releases to either soil and/or groundwater; however, based on the local topography, the facilities are believed to be either downgradient or crossgradient of the LOD. A shopping center, known as the Maryland City Plaza Shopping Center, is directly to the south of the LOD and portion of its parking lot is within the boundaries of the LOD. The shopping center previously had a drycleaner. Groundwater samples collected were found to have detected concentrations of chlorinated solvents that exceeded their respective MDE cleanup standards. Additional subsurface investigations performed at the property in 2004 indicated that the groundwater contamination plume did not impact off-site properties. In August 2004, the owners of the shopping center submitted a VCP application for the property seeking a NFRD as a responsible person. The NFRD issued on February 7, 2007 authorized use of the property for commercial/industrial purposes, imposed a groundwater use prohibition, required groundwater characterization prior to disposal, and use of a vapor barrier or additional subsurface testing for new building construction. Based on the local topography, the former drycleaner business is believed to be approximately 125 feet south (upgradient) of the western portion of the LOD; however, the land-use control area appears to either overlap or abut the entire southern third of the LOD. Thus, impacts to the LOD cannot be ruled out. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1, 7, 8	Maryland City Plaza Shopping Center 3401-3495 Fort Meade Road	0	LUC, SHWS, VCP - The shopping center is occupied by multiple commercial tenants and a Shoppers Food warehouse store. The Maryland City Valet, a former dry cleaning facility on the property, occupied tenant spaces 3449 and 3461. The most recent dry cleaning operation, Kim's Cleaners, occupied tenant space 3461, approximately 125 feet south (upgradient) of the LOD until 2001. A beauty salon currently occupies this tenant space. Two Phase I Environmental Site Assessments (ESAs) were completed in 1994 and 1996, respectively. The disposal of tetrachloroethene (PCE) at the Maryland City Valet facility was identified as a potential recognized environmental condition for the property. In September 2001, the on-site dry cleaning machine and associated PCE wastes were removed from tenant space 3461. A Phase I ESA conducted in March 2004, identified PCE as a contaminant of concern due to its use at the former dry cleaning facility. A subsurface investigation was conducted in April 2004. Soil and groundwater samples were collected and analyzed for volatile organic compounds. PCE and its degradation products were detected in groundwater samples at levels exceeding the MDE's cleanup standards, but soils contaminated with PCE did not exceed the cleanup standards. Additional subsurface investigations performed at the property in 2004 indicated that the groundwater contamination plume did not impact off-site properties. Indoor air monitoring and sub-slab soil gas monitoring at tenant space 3461 were completed in August 2005. In August 2004, the owners of the shopping center submitted a VCP application for the property seeking a NFRD as a responsible person. The NFRD issued on February 7, 2007 authorized use of the property for commercial/industrial purposes, imposed a groundwater use prohibition, required groundwater characterization prior to disposal, and use of a vapor barrier or additional subsurface testing for new building construction. Based on the local topography, the former drycleaner business is approximately 125 feet south (upgradient) of the western portion of the LOD; however,	High

1, 7, 8	Maryland City Plaza Shopping Center 3401-3495 Fort Meade Road (Cont.)	0	the land-use control area appears to either overlap or abut the southern portion of the LOD	High
2	3400 Laurel Fort Meade Road	114	Spills - An unknown amount of cooking oil was found to be leaking from a drum. The drum was located near a storm drain and therefore some of the oil could have gotten into the storm sewer. No further information was provided.	Low
3	Spic & Span Laundry 3433 Fort Meade Road	190	FINDS/FRS, RCRA CESQG - The Spic & Span Laundry located south of the LOD is an active RCRA-CESQG. No violations associated with the facility were identified in the available records. The site was plotted 190 feet to the east; however, based on further review the site is approximately 300 feet south (upgradient) of the LOD.	Low
4	Laurel Citgo/ 3396 Fort Meade Road	320	<p>FINDS/FRS, ICIS – Minor air permit. The facility received one informal administrative NOV related to their air permit.</p> <p>ERNS - Three ERNS cases are associated with the gas station. All involved customer error or pump failure that resulted in surficial releases of gasoline between 1.5 to 3 gallons of gasoline on the concrete.</p> <p>UST, OCP - This is an active gas station that is directly across Laurel Fort Meade Road from the LOD. This gas station has 2 15,000-gallon gasoline USTs. In 2017, two 10,000-gallon gasoline USTs, a 10,000-gallon Diesel UST were excavated and removed from the site. In 1992, a 550-gallon heating oil UST, a 1,000 gallon used oil UST, and a 1,000-gallon diesel UST were excavated and removed from the site in 1992. An OCP case was opened at the site in 1988. Available records state groundwater was impacted and the case was closed approximately 16 years later. Currently, the site has an open OCP case related to the three 10,000-gallon gasoline USTs that were removed in 2017. Based on the local topography, it is believed that the site is downgradient of the LOD.</p>	Low
5	7-Eleven/ 3492 Old Annapolis Road	355	FINDS/FRS – Inactive RCRA generator; no violations were identified during this review.	Low
6	Rt 198 & Red Clay Road	495	OCP - Three separate OCP cases are associated with this address. The first case was opened in October 1986 and was closed in March 1998. The second case was opened in March 1990 and was closed four months later in July 1990. The final OCP case was opened and closed September 1996. None of the cases stated whether a release occurred and/or cleanup was required. Based on further review, it is believed that these sites are associated with a shopping center located at least 495 feet southeast of the LOD.	Low

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Spic & Span Laundry 3433 Fort Meade Road	25	FINDS/FRS, RCRA CESQG - The Spic & Span Laundry located south of the LOD is an active RCRA-CESQG; no violations were identified during this review. The site was plotted 25 feet to the north of the LOD; however, based on further review the site is approximately 590 feet southeast (crossgradient) of the LOD.	Low
2,3,4	Maryland City Plaza Shopping Center/ Maryland City Valet 3401-3495 Fort Meade Road	0	FINDS/FRS, FED DRYCLEANERS, DRYCLEANERS – Listed as inactive; no violations were identified during this review. LUC, SHWS, VCP - The shopping center is occupied by multiple commercial tenants and a Shoppers Food warehouse store. The Maryland City Valet, a former dry cleaning facility on the property, occupied tenant spaces 3449 and 3461. The most recent dry cleaning operation, Kim's Cleaners, occupied tenant space 3461, approximately 85 feet south (upgradient) of the LOD until 2001. A beauty salon currently occupies this tenant space. Two Phase I Environmental Site Assessments (ESAs) were completed in 1994 and 1996, respectively. The disposal of tetrachloroethene (PCE) at the Maryland City Valet facility was identified as a potential recognized environmental condition for the property. In September 2001, the on-site dry cleaning machine and associated PCE wastes were removed from tenant space 3461. A Phase I ESA conducted in March 2004, identified PCE as a contaminant of concern due to its use at the former dry cleaning facility. A subsurface investigation was conducted in April 2004. Soil and groundwater samples were collected and analyzed for volatile organic compounds. PCE and its degradation products were detected in groundwater samples at levels exceeding the MDE's cleanup standards, but soils contaminated with PCE did not exceed the cleanup standards. Additional subsurface investigations performed at the property in 2004 indicated that the groundwater contamination plume did not impact off-site properties. Indoor air monitoring and sub-slab soil gas monitoring at tenant space 3461 were completed in August 2005. In August 2004, the owners of the shopping center submitted a VCP application for the property seeking a NFRD as a	High

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
2,3,4	Maryland City Plaza Shopping Center/ Maryland City Valet 3401-3495 Fort Meade Road (Cont.)	0	responsible person. The NFRD issued on February 7, 2007 authorized use of the property for commercial/industrial purposes, imposed a groundwater use prohibition, required groundwater characterization prior to disposal, and use of a vapor barrier or additional subsurface testing for new building construction. Based on the local topography, the former drycleaner business is believed to be approximately 85 feet south (upgradient) of the of the LOD; however, the land-use control area appears to either overlap or abut the southern portion of the LOD.	High
5	7-Eleven/ 3492 Old Annapolis Road	230	FINDS/FRS – Inactive RCRA generator; no violations were identified during this review.	Low
6	Family Dollar/3459 Fort Meade Road	125	FINDS/FRS, RCRA CESQG – An active RCRA-CESQG; no violations were identified during this review. The site was plotted 250 feet to the west of the LOD; however, based on further review the site is approximately 125 feet southeast (crossgradient) of the LOD.	Low
7	Motel 6/ 3510 Old Annapolis Road	405	ERNS/SPILLS – 5 gallons of hydraulic fluid was released from a garbage truck onto the roadway and into a storm drain due to equipment failure. Based on the local topography, the site is believed to be downgradient of the LOD.	Low
8	Shell Station/ 3460 Fort Mead Road	395	<p>FINDS/FRS – Minor air permit and NPDES permit; no violations were identified during this review.</p> <p>UST, OCP - This is an active gas station located to the north west of the LOD. The gas station currently has one 10,000-gallon gasohol, one 12,000-gallon gasohol, and one 10,000-gallon diesel installed in 2003. One 550-gallon Heating Oil UST, three 10,000-gallon gasoline USTs, and a 1,000-gallon used oil UST were all removed between 1995 and 2002. Four OCP cases have been opened at the site; however only one OCP case, opened in 2001 had a documented released and cleanup/ remediation was required. The case was closed approximately a year and a half later.</p> <p>Spills – Approximately 50-gallons of diesel was released onto the ground after a saddle tank was ripped off a truck. The spill was cleaned up.</p> <p>Based on the local topography the site is believed to be downgradient of the LOD.</p>	Low
9	3400 Fort Mead Road	539	Spills – An unknown amount of cooking oil was found to be leaking from a drum. The drum was located near a storm drain and therefore some of the oil could have gotten into the storm sewer. No further information was provided.	Low

Quadrant:	NE
Watershed:	PAX
Street Address/Nearest Cross Streets	South side of Laurel Fort Meade Road (MD 198), west Red Clay Road.
City	Laurel
County	Anne Arundel
Type of property	ROW
Ranking Rationale Site Summary	
<p>The LOD is located along the south side of Fort Meade Road (MD 198), west of Red Clay Road, in Laurel, Maryland. The surrounding area is primarily commercial properties, with residential properties further to the north and south. The area surrounding the LOD was primarily forested land up until 1970, when much of the area was cleared for commercial development. Commercial development, as well as residential development further to the north and south continued through 2005, when the surrounding area was observed to be developed in its current configuration. There is a gas approximately 85 feet southeast of the LOD, as well as a second gas station approximately 165 feet to the north of the LOD. Both gas stations have reported releases to either soil and/or groundwater. The gas station to the southeast in potentially upgradient of the eastern portion of the LOD. A shopping center, known as the Maryland City Plaza Shopping Center, is directly to the south of the LOD and portion of its parking lot is within the boundaries of the LOD. The shopping center previously had a drycleaner. Groundwater samples collected detected concentrations of chlorinated solvents that exceeded the MDE cleanup standards. Additional subsurface investigations performed at the property in 2004 indicated that the groundwater contamination plume did not impact off-site properties. In August 2004, the owners of the shopping center submitted a VCP application for the property seeking a NFRD as a responsible person. The NFRD issued on February 7, 2007 authorized use of the property for commercial/industrial purposes, imposed a groundwater use prohibition, required groundwater characterization prior to disposal, and use of a vapor barrier or additional subsurface testing for new building construction. Based on the local topography, the former drycleaner business is approximately 525 feet southwest (crossgradient) of the western portion of the LOD; however, the land-use control area appears to either overlap or abut the entire southern third of the LOD. Thus, impacts to the LOD cannot be ruled out. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Rt 198 & Red Clay Road	200	OCP - Three separate OCP cases are associated with this address. The first case was opened in October 1986 and was closed in March 1998. The second case was opened in March 1990 and was closed four months later in July 1990. The final OCP case was opened and closed September 1996. None of the cases stated whether a release occurred and/or cleanup was required. Based on further review, it is believed that these sites are associated with a shopping center located at least 200 feet southeast of the LOD. Based on the local topography, the site is believed to be crossgradient of the LOD.	Low
2	3400 Laurel Fort Meade Road	228	Spills – A large container of cooking oil was actively leaking and threatening a storm drain.	Low
3	7-Eleven Store #32390/ 3393 Laurel Fort Meade Road	85	<p>FINDS/FRS, ICIS,– Minor air permit</p> <p>OCP, UST - This is an active gas station that is across Red Clay Road from the LOD. In 1998, a 15,000-gallon gasoline UST, and two 10,000-gallon gasoline USTs were installed at the site. An OCP case was opened afterwards due the discovery of impacted soil. The material was reportedly addressed and the case was closed a year and half later. A second OCP case was opened due to a tank failing a tightness test. No release occurred, the UST was repaired and the case was closed 3 months later. In 2011, the three USTs installed in 1998 were excavated and removed from the site and two 20,000-gallon petroleum USTs installed in their place. Impacted material was encountered during the removal of the old USTs and installation of the new USTs. The material was reportedly addressed and the case was closed approximately 11 months later in 2012.</p> <p>SPILLS – In September 2015, approximately 2 gallons of diesel fuel was released onto the ground due to a pump malfunction. The pumps were shut off and the spill was cleaned up using absorbents. In 2020, approximately 10-gallons diesel was observed on the concrete surface, the source was unknown at the time that it was reported.</p>	Moderate

3	7-Eleven Store #32390/ 3393 Laurel Fort Meade Road	85	Based on the local topography, groundwater is believed to flow to the north/northwest, potentially upgradient of the LOD.	Moderate
4	Laurel Citgo/ 3396 Fort Meade Road	165	<p>FINDS/FRS, ICIS – Minor air permit. The facility received one informal administrative NOV related to their air permit.</p> <p>ERNS - Three ERNS cases are associated with the gas station. All involved customer error or pump failure that resulted in surficial releases of gasoline between 1.5 to 3 gallons of gasoline on the concrete.</p> <p>UST, OCP - This is an active gas station that is directly across Laurel Fort Meade Road from the LOD. This gas station has 2 15,000-gallon gasoline USTs. In 2017, two 10,000-gallon gasoline USTs, a 10,000-gallon Diesel UST were excavated and removed from the site. In 1992, a 550-gallon heating oil UST, a 1,000 gallon used oil UST, and a 1,000-gallon diesel UST were excavated and removed from the site in 1992. An OCP case was opened at the site in 1988. Available records state groundwater was impacted and the case was closed approximately 16 years later. Currently, the site has an open OCP case related to the three 10,000-gallon gasoline USTs that were removed in 2017. Based on the local topography, it is believed that the site is downgradient of the LOD.</p>	Low
5	Target Store T1007/ 3343 Corridor Marketplace	475	FINDS/FRS, RCRA LQG – The Target located to the southeast of the LOD is an active RCRA-LQG ; no violations were identified during this review.	Low
6	Maryland City Plaza Shopping Center/ 3401-3495 Fort Meade Road	0	LUC, SHWS, VCP - The shopping center is occupied by multiple commercial tenants and a Shoppers Food warehouse store. The Maryland City Valet, a former dry cleaning facility on the property, occupied tenant spaces 3449 and 3461. The most recent dry cleaning operation, Kim's Cleaners, occupied tenant space 3461, approximately 125 feet south (upgradient) of the LOD until 2001. A beauty salon currently occupies this tenant space. Two Phase I Environmental Site Assessments (ESAs) were completed in 1994 and 1996, respectively. The disposal of tetrachloroethene (PCE) at the Maryland City Valet facility was identified as a potential recognized environmental condition for the property. In September 2001, the on-site dry cleaning machine and associated PCE wastes were removed from tenant space 3461. A Phase I ESA conducted in March 2004, identified PCE as a contaminant of concern due to its use at the former dry cleaning facility. A subsurface investigation was conducted in April 2004. Soil and groundwater samples were collected and analyzed for volatile organic compounds. PCE and its degradation products were detected in groundwater samples at levels	High

County	Anne Arundel	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the central median of Patuxent Freeway (MD 32), east of Midway Branch overpass, in Fort Meade, Maryland. The surrounding area is undeveloped forested area to the south and military developments to the north. US Army Garrison Fort George G. Meade to the north has been a permanent Army installation since 1917. The area surrounding the LOD was previously forested land until 1993 when construction of Patuxent Highway was completed. The area surrounding the LOD has been observed in its current configuration since 2005. The LOD is located adjacent to the Fort George G. Meade Superfund site, which includes 24 Operable Units (OUs) where remedial investigations and remedy construction are currently underway. The LOD is located between the Patuxent Research Refuge – North Tract (PRR-NT) OU21 to the south and the Fort Meade Installation Area to the north. The portion of Fort Meade, directly north of the of the LOD includes the former salvage yard portion of the former Defense Property Disposal Office (DRMO OU5). This area was mainly used for storage and disposal of automobiles, drums, water heaters, heating units, dry cleaning machines, spent batteries transformers, pipe, and scrap metal. Soil tests conducted in 1995 found VOCs and SVOCs, PCBs, and metals were present. The site is contaminated with a large deep diffuse plume of PCE that extends for over 1 mile to the southeast. Based on the proximity of the site to the LOD, impacts to the LOD are considered to be high. Thus, further investigation may be warranted and/or coordination with Fort Meade DPW personnel prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

Meade Superfund site, which includes 24 Operable Units (OUs) where remedial investigations and remedy construction are currently underway. The LOD is located between the Patuxent Research Refuge – North Tract (PRR-NT) OU to the south and the Fort Meade Installation Area to the north. The portion of Fort Meade, directly north of the of the LOD includes the former salvage yard portion of the former Defense Property Disposal Office (DRMO OU5). This area was mainly used for storage and disposal of automobiles, drums, water heaters, heating units, dry cleaning machines, spent batteries transformers, pipe, and scrap metal. Soil tests conducted in 1995 found VOCs and SVOCs, PCBs, and metals were present. The site is contaminated with a large deep diffuse plume of PCE that extends for over 1 mile to the southeast, underneath the LOD.	High

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1959	The LOD and areas south-southwest appears to be forested land. Fort Meade is observed to the north of the LOD.	Aerial
1993	Patuxent Freeway is observed for the first time running alongside the LOD. The area to the north of the LOD has been further developed.	Aerial
2005	The area surrounding the LOD is observed in its current configuration.	Aerial

City	Laurel	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
The LOD lies along the north side of Fort Meade Road (MD 198), west of the intersection with Irving Street, in Laurel, Maryland. The area surrounding the LOD is mostly commercial properties. The LOD and surrounding area was agricultural and wooded areas starting from at least 1838. Fort Meade Road is first observed in 1952, and development of the commercial properties occurs from the 1971's through the mid-2000's. No records of concern that would have an impact on the LOD identified during this environmental review.

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD lies along the central median Fort Meade Road (MD 198), west of Brock Bridge Road, in Laurel, Maryland. The area surrounding the LOD is primarily commercial properties. Based on historical imagery, development did not begin until the 1960s. Prior to then the area was mostly cleared agricultural land. Commercial development of the surrounding area continued until approximately 2017, when the area was observed in its current configuration. Seven sites with OCP cases, former and active UST cases, and spill incidents identified near the LOD. All but one are either downgradient, crossgradient, or far enough away that they are not believed to impact the LOD. One site located approximately 195 feet to the east, potentially upgradient of the LOD is an active gas station with one 12,000-gal gasohol UST, and two 10,000-gal gasohol USTs currently onsite. In 1991, two 6,000-gal Gasoline USTs, one 8000-gal Gasoline USTs, one 10,000 gasoline UST, and one 4,000-gal Gasoline UST were excavated and removed from the site. Four soil samples were collected from 2 feet below the USTs and analyzed for benzene (7 to 170 ug/kg), toluene (2 to 1,200 ug/kg), ethylbenzene (10 to 450 ug/kg), xylenes 36 to 6,100 ug/kg), naphthalene (non-detect), and MTBE (non-detect). In 2004, a case was opened related to groundwater contamination and is still open; however, the file was not provided by MDE for review. Thus, impacts to the LOD cannot be ruled out. Further investigations are warranted to determine whether or not impacts are present within the boundaries of the LOD.</p>

Street Address/Nearest Cross Streets	Along interchange from east-bound Sandy Spring Road (MD 198) to north-bound I-95	
City	Laurel	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD lies along the interchange from east-bound Sandy Spring Road (MD 198) to north bound I-95, in Laurel, Maryland. The area surrounding the LOD was primarily forested land with residential properties to the north. This land was cleared when I-95 was constructed in the 1970s. The Sandy Spring Road overpass of I-95 was listed twice on the RCRA LQG databases, both for lead generation, likely associated with lead abatement during maintenance events. Any historical lead leaching from the overpass would not have been directed towards the LOD. In addition, three OCP cases were listed at the intersection of Sandy Spring Road and I-95. Two of the OCP cases were listed as vehicle accidents, while the third did not state but is presumed to also be a vehicle accident. One OCP vehicle accident case occurred in 1993, and the other two in 2003. All OCP cases were closed shortly after opening. Based on the available information, impacts to the LOD from the lead abatement or OCP cases is unlikely.</p>

City	Laurel	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD lies along the interchange from north-bound I-95 to west-bound Sandy Spring Road (MD 198), in Laurel, Maryland. The area surrounding the LOD was primarily forested land with residential properties to the north. This land was cleared when I-95 was constructed in the 1970s. The Sandy Spring Road overpass of I-95 was listed twice on the RCRA LQG databases, both for lead generation, likely associated with lead abatement during maintenance events. Any historical lead leaching from the overpass would not have been directed towards the LOD. In addition, three OCP cases were listed at the intersection of Sandy Spring Road and I-95. Two of the OCP cases were listed as vehicle accidents, while the third did not state but is presumed to also be a vehicle accident. One OCP vehicle accident case occurred in 1993, and the other two in 2003. All OCP cases were closed shortly after opening. Based on the available information, impacts to the LOD from the lead abatement or OCP cases is unlikely.</p>

Street Address/Nearest Cross Streets	Western side of Sykesville Road (MD 32), south of Old Frederick Road (MD 199)	
City	Sykesville	
County	Howard	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Sykesville Road (MD 32), south of Old Frederick Road (MD 199), in Sykesville, Maryland. The surrounding area is a mix of rural agricultural land, commercial and residential developments. Commercial and residential development began around 1982, and the surrounding area is observed in its current configuration by 2009. A SPILLS record, associated with an overturned fertilizer tanker truck in 2013, resulted in a diesel fuel release. A remediation contractor was hired to clean up the spill, who pumped the remaining diesel fuel from the damaged saddle tank, and used absorbent dust and pads to address the released fuel. A request was submitted to MDE for further information on this incident; however, MDE was unable to identify any files. Thus, impacts to the LOD cannot be ruled out. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

Ranking Rationale Site Summary		
<p>The LOD is located in a median along the eastern side of Sykesville Road (MD 32), south of the Baltimore National Pike (US Route 40) overpass in, West Friendship, Maryland. The surrounding area is semi-rural with some residential properties. The surrounding area was used for agricultural purposes since at least 1959. Residential development was observed to begun prior to 1982, and the surrounding area was viewed in its current configuration by 2005. The database listed an OCP case for a tank closure with a release and cleanup activities occurring 85 feet from the LOD; however, following receipt of information from MDE on this case, it was determined that this OCP case is actually located approximately 4,500 feet south of the LOD. Based on this distance, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the central median of I-70, near the on/off ramps for Sykesville Road (MD 32), in Marriottsville, Maryland. The surrounding area is a mix of rural agricultural land, forested land and commercial properties. Development of the surrounding area is observed to begin prior to 1982, and is in its current configuration by 2005. One record of concern, a facility listed on the UST and OCP databases, was mapped at 485 feet from the LOD. The OCP case was opened for removal of A 1,000-gallon gasoline UST. A release and cleanup actions occurred, and the case was closed within a year. Based on local topography the site is believed to located downgradient/crossgradient from the LOD. Thus, impacts to the LOD are unlikely.</p>

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of MD 97, south of Monticello Drive, in Cooksville, Maryland. The surrounding area is semi-rural with patches of forested land. Development of the surrounding area is observed to begin by 1982, and continued through 2005, when the surrounding area was observed to be developed in its current configuration. An OCP case was opened approximately 825 feet north of the LOD in 1991, for an unknown reason related to motor/lube oil. No release or cleanup activities were reported. The case was closed 16 years later. Based on the distance of the site from the LOD, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the eastern side of Woodbine Road (MD 94), immediately north of Frederick Road (MD 144), in Woodbine, Maryland. The surrounding area is semi-rural with a mix of commercial and residential developments. Commercial and residential development is observed to begin prior to 1959, and is in its current configuration by 1995. Five records of concern were listed, the closest being approximately 215 feet from the LOD, involving a release of ½ gallon of hydraulic fluid due to a leaking line on a trash truck. This release was addressed using absorbent material. The remaining four records, three OCP cases and one UST case, are all greater than 500 feet from the LOD. Based on this, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	Truck weigh station along north side of Baltimore National Pike (I-70/US Route 40)	
City	Sykesville	
County	Carroll	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the northern side of the Baltimore National Pike (I-70/US Route 40), at a truck weigh station, in Sykesville, Maryland. The surrounding area is primarily agricultural land, which started prior to 1959, along with some forested land and residential developments to the north and east. The surrounding area is observed in its current configuration by 1995. In 2016, an incident involving a tractor trailer truck resulted in an estimated release of 50 gallons of diesel from a damaged saddle tank. Dam and diking were used to contain the release which was cleaned up using absorbent dust. As the release may have occurred within the LOD, a PIA request was submitted to MDE for this SPILLS incident, but MDE stated that no files were available. Due to lack of information relating to this record, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

Street Address/Nearest Cross Streets	Northwest of the intersection between Georgia Avenue (MD 97) and Heritage Hill Drive	
City	Brookeville	
County	Montgomery	
Type of property	ROW/private	
Ranking Rationale Site Summary		
<p>The LOD is located northwest of the intersection between Georgia Avenue (MD 97) and Heritage Hill Drive, in Brookeville, Maryland. The surrounding area is primarily residential neighborhoods. The surrounding area was primarily developed as agricultural properties up until approximately 1971, when residential development began to the west. The surrounding area was observed to be developed in its current configuration by 2018. There are two database listings associated with OCP cases and UST were listed at properties 390 feet to the south and 1,100 feet to the northeast. Both sites are believed to be downgradient of the LOD. All the USTs have been removed and cases received closure from MDE. Thus, impacts to the LOD are unlikely since the sites are believed to be downgradient.</p>

Street Address/Nearest Cross Streets	Along New Hampshire Ave (MD 650), southeast of the intersection with Brooke Road	
City	Ashton-Sandy Springs	
County	Montgomery	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the east side of New Hampshire Avenue (MD 650), north of Brooke Road, in Ashton-Sandy Springs, Maryland. The surrounding area is primarily residential. Residential development in the surrounding area is observed to begin around 1963 and continue through 2005, when the surrounding area was observed to be developed in its current configuration. In 1995, approximately 4-gallons of fuel oil was spilled due to the overfilling of a tank at a residential property approximately 550 feet south of the LOD. The material was contained, cleaned up, and properly disposed of. Based on the quantity released and distance, impacts to the LOD are unlikely.</p>

Watershed:	PAX	
Street Address/Nearest Cross Streets	East side of Pennsylvania Avenue (MD 4), west of Pennsylvania Avenue Service Road, and north of Armstrong Lane	
City	Upper Marlboro	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary <p>The LOD along the east side of Pennsylvania Avenue (MD 4), west of Pennsylvania Avenue Service Road, and north of Armstrong Lane, in Upper Marlboro Maryland. The area surrounding the LOD was primarily agricultural land until the late 1970s, when development was observed to occur. Joint Base Andrews has been present to the south of the LOD since 1949. Commercial development of the area surrounding the LOD was first observed in 1981. The surrounding area was observed to be developed in its current configuration in 2018. Several OCP cases were identified in the immediate vicinity of the LOD. However, after further review, two of the sites were found to be located between 470 and 850 feet to the northeast (crossgradient) of the LOD. A former gas station is located approximately 265 feet south (downgradient) of the LOD. Two 1,000 gallon USTs (heating oil and used oil) were excavated from the site in 1997. Three gasoline underground storage tanks (USTs) were removed: two 6000-gallon and a 10,000-gallon gasoline and diesel UST were excavated and removed from the site in 2008 as part of the demolition of the facility. Residually impacted soil is believed to be present onsite; however, since the site is downgradient of the LOD, impacts are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1,2	Woods Property 8600 Pennsylvania Ave Upper Marlboro MD 20774	470	<p>OCP – An OCP case was opened in October 2006 in relation to an AST Leak of commercial heating oil. The release was documented, and clean-up activities occurred. The case was closed four months later in February 2007.</p> <p>UST - The site has a currently active Heating Oil UST that was installed in March 1990. The volume of the tank is unknown.</p> <p>Based on a review of available information and historical/ current imagery, the AST and UST are at least 470 feet crossgradient of LOD</p>	Low
3	Former Exxon #25382 8700 Pennsylvania Ave Upper Marlboro MD 20772	198	<p>RCRA SQG, OCP – The facility was previously listed as a RCRA SQG. No violations were identified in the available records.</p> <p>OCP -Two OCP cases are associated with this property.</p> <p>1997 – Two 1,000-gallon USTs (diesel #2 and used oil) were excavated and removed from the site in 1997. PID readings from the excavation ranged from 10 ppm to 140 ppm. Two soil samples were collected from underneath the former USTs and analyzed for BTEX (89 ug/kg and 18,200 ug/kg), TPH-DRO (14 mg/kg [used oil UST only]), TPH-GRO 30 mg/kg [used oil only], naphthalene (ND). Based on the analytical data, the case received closure in 2001.</p> <p>2008 - Three gasoline underground storage tanks (USTs) were removed: two 6000-gallon and a 10,000-gallon. The USTs did not contain perforations, and there was no evidence of petroleum impact to the soil. The removed soil was returned to the excavation, and six post-excavation soil samples were collected. During removal of the dispensers and lines, petroleum contaminated soils were encountered, and approximately 25.11 tons of soil were removed for proper off-site disposal. Eight confirmatory soil samples were collected from excavation and analyzed for TPH-GRO, TPH-DRO, and VOCs, all of which were below MDE action levels, with the exception of one detected concentration of TPH-GRO at 1,400 mg/kg. Based on the analytical data, the case received closure from MDE approximate one and half months later.</p> <p>The facility was demolished in approximately 2008, shortly after when the last three USTs were removed the site. Based on the local topography, the site is believed to be downgradient of the LOD.</p>	Low

Watershed:	PAX	
Street Address/Nearest Cross Streets	Northeast of the intersection of Pennsylvania Avenue (MD 4) and Westphalia Road	
City	Upper Marlboro	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located northeast of the intersection of Pennsylvania Avenue (MD 4) and Westphalia Road, in Upper Marlboro, Maryland. The area surrounding the LOD is densely developed with commercial properties. The area was mostly cleared agricultural land until the 1970s when development began to the east of the LOD. Residential properties surrounding the LOD were cleared for commercial development. Development continued through 2017. Several sites with active and former USTs, OCP cases, documented spills were identified in the immediate vicinity of the LOD; however, most appear to far enough hydraulically crossgradient or downgradient of the LOD, with the exception of a gas station located approximately 100 feet north of the LOD that has two 10,000-gal gasohol, and one 10,000-gal diesel (installed in 1984). PIA request was submitted to MDE for further information on the site. One OCP case was opened in 1984 for the installation of the USTs and not due to a release. A second OCP was opened in 1989 and closed on a unknown date. MDE stated the file had been destroyed per their file retention policies. The available information did not state whether a release had a occurred or not. In 2020, the facility's environmental contractor reported the discovery of petroleum contaminated soils underneath all the dispensers onsite; however, no other information was provided. Based on the local topography, the site is believed to be upgradient of the LOD. Thus, impacts to the LOD cannot be ruled out. Further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

Type of property	ROW and private property	
Ranking Rationale Site Summary		
<p>The LOD is located along west side of Silver Hill Road (MD 458), north of Marlboro Pike (MD 4), in District Heights, Maryland. The northwestern portion of the LOD is believed to be located within private property. The surrounding area is observed to be predominantly residential, commercial and institutional properties. Residential development in the surrounding area began in the late 1950s. Commercial development began in the 1980s. The LOD and surrounding area appeared in their current configuration by 2009. Two gas stations and an auto repair shop with multiple closed and active USTs and OCP cases are located between 440 and 490 feet south of the LOD. Based on the local topography, the site is believed to be crossgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

4	5803 Marlboro Pike, District Heights, MD	632	FINDS/FRS – Minor air permit; no violations were identified during this review.	Low

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1937	LOD appears to part of an agricultural and rural residential property. The surrounding area appears to be a mix of undeveloped, agricultural and residential properties. Marlboro Pike appears to be constructed.	Aerial
1959	The LOD appears to be part of a residential property. Further residential development is observed in the surrounding area and a large building, that is presently a school, is visible to the north of the LOD.	Aerial
1981	The LOD appears to be grass-covered land associated with the church located southwest of the LOD. Further residential and commercial development is visible in the surrounding area. Silver Hill Road appears under construction southwest of Marlboro Pike. The gas stations on the intersections of Marlboro Pike and Silver Hill Road appear to be developed.	Aerial
2009	The surrounding area is observed to be developed in its current configuration.	Aerial

Street Address/Nearest Cross Streets	Along an unnamed tributary of the Northwest Branch Anacostia River, south of the Glenallan Avenue.	
City	Silver Spring	
County	Montgomery	
Type of property	Public ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along an unnamed tributary of the Northwest Branch Anacostia River, south of the Glenallan Avenue, in Silver Spring, Maryland. The eastern portion of the LOD is bisected by Kemp Mill Road. The surrounding area is a mixture of parkland, residential properties and forest land. The surrounding area was primarily agricultural and forest land, with the exception of several residential properties to the east, up until the 1960s, when additional residential development began to occur to the east and west. An equestrian center directly north of the LOD was constructed by 1964. The surrounding area was observed in its current configuration by the early 1970s. One record of concern, an OCP case from 1996, was mapped at 510 feet from the LOD. Limited information was available, but the incident appears to be associated with a release occurring during delivery of home heating oil to a residential dwelling. The OCP case was closed approximately 2 months later. Based on the local topography, the site appears to be crossgradient of the LOD. Thus, impacts to the LOD from this incident is unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along a stream known as Bald Hill Branch, south of John Hanson Highway (US Route 50), in Springdale, Maryland. Commercial properties are located to the north, across John Hanson Highway, while residential properties and forested land are located to the south, east and west. The surrounding area was primarily forest and agricultural land up until the 1950s/1960s, when residential and commercial development began. John Hanson Highway to the north as well as its interchange with Martin Luther King Jr Highway (MD 704) to the northwest were completed around 1960. The surrounding area was observed in its current configuration around 1993. No records of concern were identified during this environmental review.</p>

Quadrant:	SW	
Watershed:	PAX	
Street Address/Nearest Cross Streets	Tanglewood Park, east of Tanglewood Drive	
City	Hyattsville	
County	Prince George's	
Type of property	Public	
Ranking Rationale Site Summary		
<p>The LOD is located in within Tanglewood Park, between Tanglewood Drive to the west and Greenway Drive/Spring Lane to the east, in Hyattsville, Maryland. The surrounding area is mixed-use residential and commercial. The Northeast Branch Anacostia River is located west of the LOD, while residential and commercial properties are located north, east and south. Development in the surrounding area started prior to 1937. Fletcher's Field, located at the southern end of the LOD, was constructed in the early 1950s. By the 1970s, the surrounding area was developed in its current configuration. Nine sites of concern with former leaking USTs, OCP cases and/or document spills/releases were identified between 455 and 1,010 feet of the LOD. The most concerning of these sites was an active gas station located 445 feet to the east (upgradient). This gas station (Chevron - 5301 Kenilworth Ave) currently has three active 10,000-gallon gasoline USTs (fiberglass, installed in 1986), as well as two former USTs, a 1,000-gallon heating oil UST and 1,000-gallon used oil UST. Based on information provided by MDE, the former 1,000-gallon USTs were excavated and removed from the site in 2003. Soil samples were collected and analyzed for petroleum constituents, which were all non-detect. Three other OCP cases have been assigned to this gas station; however, these were associated with compliance violations that did not involve releases, and were closed by MDE once the deficiencies were corrected. Based on this information, this gas station is unlikely to have impacted the LOD. The remaining eight sites with documented releases are not expected to have an impact on the LOD based on either their distance from the LOD, release quantity, hydraulic direction and/or case status.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	MANHOLE/ 5400-22 KENILWORTH AVE.	305	SPILLS – Evidence of a sewage overflow was identified. The amount released is unknown. The case was transferred to MDE's water management agency. Sewage is not considered an environmental concern for this evaluation.	Low
2	JEFFERSON HALL APARTMENTS/ 5402 KENILWORTH AVENUE	605	UST, OCP – In 2004, a 10,000-gallon heating oil UST was excavated and removed from the property. A release was reported, addressed, and closed approximately one month later. Based on a review of historical imagery the UST was most likely approximately 605 feet east (upgradient) of the northern portion of the LOD.	Low
3	RIVERDALE TOWERS	505	ICIS – NPDES permit, no violations noted.	Low
4	CHEVRON / PAT'S TEXACO/ RED TOP 5301 KENILWORTH AVE	455	<p>FINDS/FRS, ICIS – Minor air permit.</p> <p>RCRA-SQG – Active RCRA generator, no violations.</p> <p>OCP, UST – The site is an active gas station that currently has three active 10,000-gallon gasoline USTs (fiberglass, installed in 1986). Below is a summary of information provided by MDE through a PIA request.</p> <p>1998 – A leak was discovered in fuel filter at one of the dispensers. It is believed that the leak was de minimis in nature. The dispenser was repaired and the case was closed two months later.</p> <p>2000 – An OCP case was opened in association with a compliance inspection that identified several deficiencies in the UST system, none of which had caused a release though. The deficiencies were corrected and the case was closed four and a half years later.</p> <p>2003 – A 1,000-gallon heating oil UST and 1,000-gallon used oil UST were excavated and removed from the site in 2003. No evidence of a release was observed during the removal of the USTs. Additionally, a composite soil sample was collected and analyzed for BTEX, MTBE, TPH-DRO/GRO and RCRA-Metals, all of which were non-detect. The case was closed approximately 1 month later.</p> <p>Based on the local topography, the site appears upgradient of the LOD.</p>	Low

5	RIVERDALE VILLAGE APTS/ 5508 54TH AVE	620	<p>OCP, UST – In 1996, a case was opened and closed within a month due to a release heating oil resulting in soil contamination. Later in 1996, an 8,000-gallon heating oil UST was excavated and removed from the site and the case was closed approximately one month later.</p> <p>HMIRS – In 1990, 4 gallons of heating oil was released. The material was addressed and the case was closed. Based on the local topography, the property appears crossgradient of the LOD.</p>	Low
6	5100 TANGLEWOOD DR, HYATTSVILLE, MD, 20781	555	<p>SPILLS – A sewer pipe was reported to be leaking sewage at approximately 5-gallons per minute in 2016. Local sewer technicians were reportedly onsite to mitigate the problem. Sewage is not considered an environmental concern for this evaluation.</p>	Low
7, 12, 13	BP / AMOCO STATION # 00765/ 5500 KENILWORTH AVENUE	835	<p>FINDS/FRS, ICIS, ERNS, OCP, UST, HMRIS, RCRA-SQG – The site is an active gas station that currently has three 12,000-gallon gasoline USTs. Two 8,000-gallon and two 6,000-gallon gasoline USTs were excavated and removed in 1992. A 550-gallon heating UST and a 550-gallon diesel UST were excavated and removed in 2003. The site has multiple OCP cases related to releases, as well as several small spill cases. The site is located approximately 835 feet to east (upgradient) of the LOD.</p>	Low
8	5249 KENILWORTH AVENUE	565	<p>FINDS/FRS – Air permit, no violations noted.</p>	Low
9	PARK TANGLEWOOD APTS/ 5309 RIVERDALE RD	310	<p>FINDS/FRS – Air permit, no violations noted.</p> <p>UST, OCP – In 1994, a 10,000-gallon heating oil UST was excavated and removed from the facility. An OCP case was opened for the closure that did not state whether a release occurred or remediation occurred. Based on the local topography, the site is believed to be approximately 310 feet north (crossgradient) of the LOD.</p>	Low
10	FLETCHERS FIELD APARTMENTS/ 5223 KENILWORTH AVENUE	615	<p>UST, OCP – In 1996, a 10,000-gallon heating oil UST was excavated and removed from the site. No release or cleanup was reported, and the case was closed less than two weeks later. Based on aerial photographs, the UST was likely located at least 1,060 feet to the east.</p>	Low
11	BP / CROWN MD-113 5435 KENILWORTH AVE	1,010	<p>RCRA-SQG – Active RCRA generator, no violations noted.</p> <p>OCP, UST – The site is an active gas station. In 1994, two 10,000-gallon and one 20,000-gallon diesel UST were excavated and removed from the site. Two 15,000-gallon gasoline and one 10,000-gallon diesel UST were installed in their place. Groundwater contamination was encountered during the removal the older USTs. The OCP case related to the impacts remained open until 2000. Several other OCP cases were opened and closed between 2000 and 2014. Based on local topography, the site is approximately 1,010 feet east (upgradient) of the LOD.</p>	Low

Project Area Site Descriptions

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1937	LOD is observed as forested land east of Northeast Branch of the Anacostia River. The surrounding area is primarily composed of agricultural land and residential properties.	Aerial
1960	Substantial residential and commercial development is observed in all directions. Land along the North Branch Anacostia River, west of the LOD has been cleared of vegetation.	Aerial
1971	Additional residential and commercial development is observed in all directions. Surrounding area is developed in its current configuration.	Aerial

Street Address/Nearest Cross Streets	Western side of on-ramp to John Hanson Highway (US Route 50) from Landover Road (MD 202)	
City	Cheverly	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of the on-ramp for south-bound John Hanson Highway (US Route 50) from east-bound Landover Road (MD 202) in Hyattsville, Maryland. The surrounding area is mixed-use residential/commercial with commercial and residential properties located to the north, south and west and primarily commercial properties to the east, beyond the interchange with John Hanson Highway. Residential development began in the 1940s/1950s, while commercial development began in the 1960s, approximately about the same time as when the John Hanson Highway and interchange with Landover Road was observed to have been completed (1963). The surrounding area was observed in its current configuration in 1981. An active drycleaner is located approximately 645 feet northwest of the LOD (upgradient). There are no reported violations associated with the cleaners and based on its distance from the LOD, impacts are unlikely. Several other records of concern are located within 1,385 feet of the LOD; however, based on the type of records (e.g. air permit, RCRA NON GEN) hydraulic direction (crossgradient/downgradient) of the LOD, impacts from these sites/incidents on the LOD are unlikely.</p>

2	Hanson Arms Apartments/ 6527 Landover Road	1,385	OCP, UST – In 2006, a 15,000-gallon heating oil UST was excavated and removed from the apartment complex. Impacted subsurface media was encountered during the removal that was addressed/remediated and the case was closed approximately 3 months later. Based on a review of aerial photographs, the boiler room appears to be approximately 1,385 feet west of the LOD.	Low
3	Printcraft/ 3601 Cooper Lane	600	FINDS/FRS, ICIS – Minor air permit; no violations were identified during this review.	Low
4	CVS Pharmacy #1489/ 6516 Landover Rd	605	FINDS/FRS, RCRA-LQG – No violations were identified during this review.	Low
5	Roadway Rt. 50 & Landover Rd	625	SPILLS – A tow truck involved in a vehicular accident released approximately 2-gallons of motor oil. The material was addressed and the case was closed.	Low
6	Roadway/ US 50 E at Landover Rd	645	SPILLS – A semi-truck was found to be leaking diesel into a nearby creek. The material was addressed and the case was closed. Since the LOD is located in the central portion of John Hanson Highway any impacts in a creek would have a minimal impact on the LOD.	Low
7	Bruce Cleaners/ 6508 Landover Road Landover, Md 20785	645	Drycleaner, FINDS/FRS, ICIS, RCRA-CESGQ – Based on available information, this is an active drycleaner with no reported violations; however, the facility appears to be located upgradient of the LOD.	Low

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1960	The surrounding area is primarily residential and forested land. An on ramp part of the John Hanson Highway is observed to be under construction south of the LOD.	Aerial
1963	The John Hanson Highway is observed to have been completed, along with the interchanged with Landover Road to the east. Additional commercial development is observed to the south and west.	Aerial
1981	The surrounding area is observed to be developed in its current configuration. Additional commercial development is observed to the north, east, and west.	Aerial

Street Address/Nearest Cross Streets	Median of John Hanson Highway (US Route 50), north of Landover Road (MD 202)	
City	Hyattsville	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located within a median formed by the interchange of John Hanson Highway (US Route 50) and Landover Road (MD 202), in Hyattsville, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are located to the north and south of the LOD, commercial and residential properties to the west, and primarily commercial properties to the east. Residential development began in the 1940s/1950s, with the John Hanson Highway and associated interchange with Landover Road observed to have been completed in 1963. The surrounding area was observed in its current configuration around 1981. A printshop is located approximately 540 feet to the northwest that has an active air permit (no violations). Two vehicular spills have occurred approximately 225 to 235 feet south of the LOD. Both spills were minor in quantity and were reportedly cleaned-up. Thus, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	Southeastern portion of US Route 50 and Baltimore-Washington Parkway (MD 201) interchange	
City	Capitol Heights	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the southeastern portion of the interchange between John Hanson Highway (US Route 50) and Baltimore-Washington Parkway (MD 201), in Hyattsville, Maryland. The surrounding area is primarily vacant land. Light industrial and commercial properties are located to the northeast and southeast, and a wastewater treatment plant to the southwest. By the 1960s, many of the industrial and commercial properties were observed to be present to the northeast and southeast, while the wastewater treatment plan was observed in 1981. Two records of concern in the surrounding area were identified. An active scrap metal facility, located approximately 505 feet south of the LOD, was listed as having a 10,000-gallon and 8,000-gallon diesel USTs closed via excavated in 1986 and 1994, respectively, as well as receiving multiple violations for improper storage of hazardous and petroleum products. The Beavertown Creek separates the LOD from scrap metal facility; thus, the LOD is likely not hydraulically connected to the scrap metal facility. The second record, an OCP case associated with a vehicle accident occurring 565 feet from the LOD. Based on this distance, impacts to the LOD from this incident are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the south side of Landover Road (MD 202), east of Cheverly Avenue, in Cheverly, Maryland. The surrounding area is primarily residential, with the exception of a professional office complex located west of Cheverly Avenue. The surrounding area was observed to be developed with residential properties beginning in 1945, with the Baltimore-Washington Parkway constructed around 1960. In 1971, the office park to the west was observed to have been constructed and the surrounding area was observed in its current configuration. An OCP case related to soil contamination was opened at a property approximately 180 feet to the southwest (downgradient) of the LOD. The material was addressed/remediated and the case closed one month later. Based on status (closed) and hydraulic direction, impacts to the LOD from this incident are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD lies along the southern side of Landover Road (MD 202), east of the overpass for Martin Luther King Jr Highway (MD 704), in Greater Landover, Maryland. The area to the north, east, and south is primarily residential properties. The surrounding area was vacant forested land up until 1960, when development of the residential properties to the south of the LOD was observed. The area surrounding the LOD has been in its current configuration since 1981. One record of concern, the Landover Road overpass of Martin Luther King Jr Highway, was listed as a RCRA LQG likely associated with lead abatement during maintenance activities. Impacts to the LOD from the overpass work are unlikely.</p>

Watershed:	WAS	
Street Address/Nearest Cross Streets	West side of Brightseat Road, north of Sherriff Road	
City	Greater Landover	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD lies along the west side of Brightseat Road, north of the intersection with Sheriff Road, in Landover, Maryland. A portion of the LOD extends east, across Brightseat Road. Paved and unpaved parking lots associated with FedEx Field are present to the west, southwest and southeast. Commercial structures are located to the north and east. The surrounding area was primarily agricultural and forested land up until the later 1970s, when commercial development began. The LOD and surrounding area were observed to be developed in their current configuration around 2005. Four sites were identified in the environmental database between 295 feet and 530 feet of the LOD, that were listed either having former USTs, OCP cases, reported SPILLS, or being RCRA generators. The closest facility, an auto dealership located 295 feet from the LOD, previously had a 1,000-gallon used oil UST and two 2,000-gallon gasoline USTs removed in 1995. No releases associated with the former USTs were reported. An additional OCP case was noted with this facility, occurring in 1987; however, no other information was available other than it was closed later that year. Based on a review of historical imagery, the former USTs are believed to be at least 415 feet to the northwest (crossgradient) of the LOD. The three remaining sites identified to have potential environmental concerns are more than 450 feet of the LOD. Thus, impacts from these sites are unlikely.</p>

Street Address/Nearest Cross Streets	South side of Martin Luther King Jr Highway, east of the Reed Street	
City	Glenarden	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD lies along the southern side of Martin Luther King Jr. Highway (MD 704), east of Reed Street, in Glenarden, Maryland. The area was primarily forest land until residential and commercial development started in the 1960's. Development continued through the 1970's and early 1980's. The area surrounding the LOD has been observed in its current configuration since 1981. One record of concern, an ERNS case located 354 feet to the south, had a leak of natural gas at an apartment structure. The local natural gas company responded and addressed the leak. Based on the distance and type of release, impacts to the LOD are unlikely.</p>

Street Address/Nearest Cross Streets	Along Martin Luther King Jr. Highway, north of Goodland Drive	
City	Hyattsville	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Martin Luther King Jr. Highway (MD 704), north of Goodland Drive, in Hyattsville, Maryland. The surrounding area is primarily residential, with a gas station and school located to the southwest. A stream running east to west is observed further to the south. Based on historical imagery, the surrounding area was rural/vacant land up until the mid-1940s, when residential development was observed southwest of the LOD. Residential development continued up until the 1980s when the surrounding area was observed to be developed in its current configuration. A gas station located approximately 65 feet south of the LOD has existed since 1970. Nine petroleum USTs ranging in size from 550-gallons to 12,000-gallons have been registered to this gas station property. Currently there are three USTs, one 12,000-gallon gasoline, one 6,000-gallon diesel and one 10,000-gallon gasoline UST active onsite. Six OCP cases have been open and closed at the facility, one of which was in regard to a ground seep investigation/clean-up that was opened in September 2001 and closed in December 2001. Three spills have occurred that resulted in releases to the ground surface, all of which were properly addressed and closed. Based on available data provided by MDE through a PIA request, there is known petroleum impacted soil and groundwater above MDE actions levels currently onsite; however, the site is hydraulically downgradient of the LOD based on groundwater surveys conducted during the environment investigations performed at the gas station facility. Thus, impacts to the LOD are unlikely, as impacts from the gas station would migrate away from the LOD.</p>

1,2	Sunoco Gasoline Station/ 7530 Doctor Martin Luther King Jr Way	65	<p>FINDS/FRS, ICIS, SPILLS, UST, OCP, RCRA-SQG – Since 1970, nine petroleum USTs ranging in size from 550-gallons to 12,000-gallons have been registered to this gas station property since 1970. Currently there are three USTs, one 12,000-gallon gasoline, one 6,000-gallon diesel, and one 10,000-gallon gasoline UST active onsite. Six OCP cases have been open and closed at the facility, one of which was in regard to a ground seep investigation/clean-up that was opened in September 2001 and closed in December 2001. Three spills have occurred that resulted in releases to the ground surface, all of which were properly addressed and closed. The facility also has an air permit, NPDES permit, and is a registered RCRA-SQG.</p> <p>2001 – Three soil borings completed as monitoring wells were installed on the gas station property to characterize soil and groundwater onsite. Soil and groundwater samples were analyzed for BTEX, MTBE and TPH-GRO. Based on the analytical results. Concentrations of benzene (42 to 89 ug/kg) and MTBE (180 to 1,200 ug/kg) were detected above their corresponding MDE action levels of 17 ug/kg and 61 ug/kg, respectively. Concentrations of benzene (5.9 to 8.9 ug/l), MTBE (56 to 17,000 ug/l), and TPH-GRO (97 to 630 ug/L) were detected in MW-1 and MW-2 in the northwestern portion of the site. Impacted soil and groundwater appear to be isolated to the area surrounding the tank field in the northwest portion of the site. Based on groundwater elevation survey, groundwater is believed to be flowing northwest to southeast, downgradient of the LOD.</p> <p>2001 – A soil/groundwater investigation was conducted around the dispenser islands in the southern-central portion of the site after a fuel dispenser had been damaged. A total of four borings were advanced depth of 8 ft below grade using a hydropunch unit. Four samples were collected from various intervals based on the highest PID levels observed. A perched layer of water was encountered at 4ft below grade in one of the borings along MLK Jr Highway, while no water was encountered in the three other borings. Soil and</p>	Low

1,2	Sunoco Gasoline Station/ 7530 Doctor Martin Luther King Jr Way (cont.)	65	<p>groundwater samples were analyzed for TPH-GRO, BTEX, and MTBE. Based on the analytical results, no detected concentrations of the petroleum constituents analyzed for in the soil samples exceeded their corresponding MDE action levels. However, benzene (122 ug/L) and MTBE (13,000 ug/l) detected in the groundwater sample exceeded their corresponding action levels of 5 ug/l and 20 ug/l, respectively. Based on the results MDE, granted closure since groundwater onsite is provided by the local municipality and there were currently no pathways of exposure.</p> <p>2003 – A 550-gallon heating oil UST was excavated and removed from the northwestern exterior of the onsite structure. The excavated soils and floor of the excavation were screen with a PID that did not detect any readings above background levels. Thus, the MDE inspector did not require any soil samples to be collected and analyzed. A water sample was collected from excavation and analyzed for BTEX, MTBE, and TPH-DRO/GRO. Based on the analytical results, TPH-DRO was detected at 33,000 ug/l, TPH-GRO was detected at 58 ug/l, and MTBE at 6.3 ug/l. Both TPH-DRO and TPH-GRO exceeded their corresponding MDE action level of 47 ug/l, while the detected concentration of MTBE was below its MDE action level of 20 ug/l. BTEX was below is detection limit. Based on the results MDE, granted closure since groundwater onsite is provided by the local municipality and there were currently no pathways of exposure.</p> <p>2008 – An OCP case associated with a compliance inspection. Several items onsite were determined to not be in compliance, which were addressed and the case was closed shortly thereafter.</p> <p>2011 – A 1,000-gallon heating oil UST was excavated and removed from the northwestern exterior of the onsite structure. A soil sample was collected from both end of the UST and analyzed from TPH-GRO/DRO, BTEX, and VOCs. Only toluene and fluoranthene, both 140 ug/kg were detected in the soil sample from the northeastern end of the UST excavation. Based on the analytical results, MDE granted closure.</p> <p>2015 – A truck that drove onsite ruptured its saddle tank that caused the release of approximately 25-gallons of diesel to be released onto the ground in the vicinity of the tank field in the northern portion of the site.</p>	Low

Street Address/Nearest Cross Streets	Central median of John Hanson Highway, east of the intersection with Arbor Street	
City	Hyattsville	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is primarily located within the central median of John Hanson Highway (US Route 50), east of Arbor Street, in Hyattsville, Maryland. The central portion of the LOD extends south, across John Hanson Highway. The surrounding area is mixed use development, with residential structures to the north, commercial and residential developments west, commercial and transportation to the south, and commercial development to the east. The surrounding area was primarily forested land and residential properties, with train tracks to the south, up until the 1960s. In 1963, the John Hanson Highway was observed to have been constructed. A metro line and station were added in late 1970s/early 1980s. A elementary school approximately 460 feet northwest of the LOD had a known release from a 10,000-gallon UST that was addressed and closed in 2004. An OCP case related to dumping along the metro tracks, southwest of the northwest of the LOD, was opened in 1996, of which the material was addressed and the case closed in 1998. Based on the local topography, the elementary school appears crossgradient of the LOD, while the dumping incident appears downgradient of the LOD; therefore, impacts to LOD are unlikely.</p>

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
3	ECONOWAY 5463 ANNAPOLIS ROAD	490	FINDS/FRS, ICIS, UST, OCP – The site is active gas station that has had nine USTs registered to it since 1997. Currently there are two 12,000-gallon petroleum UST active onsite. Two OCP cases associated with UST closures have been opened and closed at the facility. One of the OCP cases documented a release and remediation occurred between 01/21/1997 and 03/12/1998. In 2017, approximately 15-gallons of gasoline were released and cleaned-up during the transfer of gasoline to a UST from a transport truck. Based on the local topography, the site appears downgradient of the LOD.	Low
4	FISCA OIL CO INC/ 5455 ANNAPOLIS RD	560	UST, OCP – Four former USTs ranging in size from 400-gallons to 12,000-gallons are associated with this facility. All four USTs were excavated and removed from the ground in 1998. An OCP case was opened for the UST removal on 09/15/1988 and closed four days later. There is no record or releases or remediation associated with these former USTs. Additionally, the site appears to be downgradient of the LOD.	Low
5	JOHNNY ON THE SPOT CLEANERS/ 5461 ANNAPOLIS ROAD	500	DRYCLEANER, FED DRYCLEANER, FINDS/FRS, RCRA-SQG – An inactive drycleaner is located approximately 545 feet north (downgradient) of the LOD. There are no reported releases, or violations associated with the facility. Impacts to the LOD are unlikely, as the site appears downgradient of the LOD.	Low
6	Exxon Station/ 5579 Annapolis Rd	535	SPILLS – In 2017, approximately 17-gallons of petroleum was released and cleaned up at the site. Based on the distance from the LOD, impacts are unlikely.	Low
7	PACCAR FINANCIAL INC/ 5456 ANNAPOLIS RD	625	OCP – An OCP case was opened in 2004 due to a release associated with a vehicle accident. The release was addressed and the case was closed shortly thereafter. Based on the local, topography, the site appears downgradient of the LOD.	Low
8	ADVANCED AUTO PARTS #9048/ 5454 ANNAPOLIS BLVD	625	FINDS/FRS, RCRA-VSQQ – No violations were noted.	Low
10	DOLLAR CITY/ 5434 ANNAPOLIS ROAD	575	ICIS – No violations expected to impact the LOD.	Low
11	GOODYEAR AUTO SERVICE CTR – BLADENSBURG/ 5445 ANNAPOLIS RD	600	FINDS/FRS, OCP, RCRA-SQG, UST – A 550-gallon used oil UST installed in 1983, was excavated and removed from the facility in November 1995. Two weeks later the case was closed. There are no indications that a release was identified or remediation was required during the removal and closure of the UST.	Low

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Along Landover Road, west of John Hanson Highway	
City	Hyattsville	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along Landover Road (MD 202), west of John Hanson Highway (US Route 50), in Hyattsville, Maryland. The surrounding area is mixed-use residential/ commercial. Commercial and residential properties are to the north, south and west, while primarily commercial properties are to the east, beyond the interchange with John Hanson Highway. Residential development began in the 1940's/1950's, while commercial development began in the 1960's, approximately about the same time as when the John Hanson Highway and interchange with Landover Road was observed to have been completed (1963). The surrounding area was observed to be developed in its current configuration around 1981. An active drycleaner is located approximately 65 feet north of the LOD (upgradient). There are no reported violations associated with the cleaners; however, the facility is located immediately upgradient of the LOD and thus remains a concern. Several other sites/incidents are located within 575 feet of the LOD; however, based on the either the spill incident, type of records (e.g. air permit, RCRA NON GEN, etc.) or hydraulic direction (cross/downgradient) from the LOD, impacts to the LOD are unlikely. A request was submitted to MDE for further information on the dry cleaner; however, MDE was unable to identify any files. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Hanson Arms Apartments/ 6527 Landover Road	700	OCP, UST – In 2006, a 15,000-gallon heating oil UST was excavated and removed from the apartment complex. Impacted subsurface media was encountered during the removal that was addressed/remediated and the case was closed approximately 3 months later. Based on a review of aerial photographs, the boiler room appears to be approximately 700 feet west of the LOD.	Low
2	CVS Pharmacy #1489/ 6516 Landover Rd	45	FINDS/FRS, RCRA-LQG – Generator of ignitable, corrosive, silver, chemical salts, epinephrine and nitroglycerine wastes, no violations.	Low
3	Bruce Cleaners/ 6508 Landover Road Landover, Md 20785	65	Drycleaner, FINDS/FRS, ICIS, RCRA-CESGQ – Active dry cleaner with no reported violations; however, the facility appears to be located immediately upgradient of the LOD. A PIA request was submitted to MDE for further information; however, MDE was unable to identify any files pertaining to the dry cleaner.	Moderate
4	Landover Animal Hospital Inc/ 3507 Maryland Ave	15	FINDS/FRS, RCRA-NON GEN – Former generator, no violations.	Low
5	Waight, E V Econo Wash Inc/ 6433 Landover Rd	107	Drycleaner, FINDS/FRS, ICIS, RCRA-NON GEN - Based on available information, this an active drycleaners. There are no reported violations associated with the cleaners. The facility is believed to be do crossgradient of the LOD.	Low
6	Roadway/ Rt. 50 & Landover Rd	270	SPILLS – A tow truck involved in a vehicular accident released approximately 2-gallons of motor oil.	Low
7,8	Roadway/ US 50 E at Landover Rd	290	SPILLS – A vehicle accident resulting in a semi-truck driving into a ditch was found to be leaking diesel from a saddle tank into a drainage ditch. Prince George Fire Department was onsite who requested assistance from MDE. Any impacts to the ditch would not have been directed towards the LOD.	Low
9	Printcraft/ 3601 Cooper Lane	375	FINDS/FRS, ICIS – Minor air permit.	Low
10	Zebra Test Facility/ 6500 Oak St	410	FINDS/FRS, TRIS – No violations. Based on local topography, the site appears to be downgradient of the LOD.	Low
11	6500 Parkwood St, Hyattsville, Md, 20784	575	SPILLS – A caller reported that they believed sewage was contaminating their drinking water in March 2020. Sewage is not a contaminant of concern for this evaluation.	Low

Street Address/Nearest Cross Streets	Along Landover Road, west of John Hanson Highway	
City	Hyattsville	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located primarily along the southern side of Landover Road (MD 202), west of John Hanson Highway (US Route 50), in Hyattsville, Maryland. The western end of the LOD extends north, into the center median of Landover Road. The surrounding area is mixed-use residential/commercial. Commercial and residential properties are to the north, south and west, while primarily commercial properties are to the east, beyond the interchange with John Hanson Highway. Residential development began in the 1940's/1950's, while commercial development began in the 1960's, approximately about the same time as when the John Hanson Highway and interchange with Landover Road was observed to have been completed (1963). The surrounding area was observed to be developed in its current configuration around 1981. Two vehicle accidents were reported near the intersection of Landover Road and John Hanson Highway, one in 2014 and one in 2017. The 2014 incident involved a fuel delivery truck's saddle tank rupturing which released diesel fuel into a nearby creek. The closest creek to the LOD is over 800 feet away, indicating this incident did not occur near the LOD. The 2017 accident incident result in a minor 2-gallon release of motor oil to the road surface only. Facilities listed on the RCRA generator database were listed at 110 feet, 515 feet and 560 feet from the LOD; however, none of these facilities had any reported violations. Impacts to the LOD from these incidents/facilities are unlikely.</p>

City	Cheverly	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is primarily located along the central median of John Hanson Highway (US Route 50), east of Columbia Park Road, in Cheverly, Maryland. The western end of the LOD extends south and runs across the southern side of John Hanson Highway. The surrounding area is mixed use development, with forested land and residential structures to the north, residential development to west, commercial development to the south and east. The surrounding area was primarily forested land and residential properties, with train tracks to the south, up until the 1960s. In 1963, the John Hanson Highway was observed to have been constructed. A metro line and station were observed to have been constructed in late 1970s/early 1980s. The surrounding area was observed to be developed in its current configuration around 1989. An OCP case related to a release of motor oil was opened at a site approximately 645 feet south (crossgradient) of the LOD. The material was addressed/cleaned-up and the case was closed. Impacts to the LOD are unlikely based on the distance and hydraulic direction from the LOD.</p>

Street Address/Nearest Cross Streets	South side of Central Avenue, between Quire Avenue and Suffolk Ave	
City	Capitol Heights	
County	Montgomery	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the south side of Central Avenue (MD 322), between Quire Avenue and Suffolk Avenue, in Capitol Heights, Maryland. The surrounding area is mixed-use residential / commercial. Residential development occurred prior to the 1960s, with commercial development starting in the 1960s. By 1994, the surrounding area was observed in its current configuration. A US Post Office facility located adjacent to the south (upgradient), which the LOD may partially reside in, was flagged as being on the UST and OCP databases. Two former 6,000-gallon gasoline USTs were excavated, one each in 1990 and 1998. A total of four OCP cases have been opened, with the 1998 UST removal case stating a release had occurred. A PIA request was submitted to MDE; however, files for three of the OCP cases have been destroyed per MDE’s file retention protocols. Files for the lone OCP case, from July 1996, stated that approximately 10-gallons of gasoline was released when an employee drove a vehicle away from the onsite refueling station while the dispenser hose was still attached to the vehicle. The gasoline was contained and cleaned up by the facility’s contractor, and the case was closed. While this release incident would unlikely impact the LOD, information pertaining to the other three OCP cases, especially the case where subsurface impacts were identified, was unavailable. Further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1,2	CAPITOL HEIGHTS POST OFFICE/ 6089 OLD CENTRAL AVE	5	OCP, UST – The facility located upgradient of the LOD has two former 6,000-gallon gasoline UST registered to it. The first UST was excavated and removed from the site in 1990 and the second UST was excavated and removed from the site in 1998. Four OCP cases are associated with the facility, two of which reported that releases and remediation occurred. A PIA request was submitted to MDE for additional information on these cases; however, all but one of the OCP case files have been destroyed per MDE file retention protocols. The lone case file that was provided stated that a release of approximately 10 gallons of gasoline occurred on June 26, 1996, when an employee was filling a vehicle and drove away while the dispensing nozzle was still connected to the vehicle. This resulted in the dispenser hose to break and the release to occur. The released gasoline was contained and cleaned up by the facility's contactor, and the case was closed on July 2, 1997. Based on the information summarized above, this incident is unlikely to have impacted the LOD. However, as USTs have historically been present at this site, and information relating to the other three OCP cases was unavailable, further investigation is warranted prior to any intrusive groundwork to determine if environmental media within the LOD has been impacted.	Moderate
3	PEPCO RELEASE/ SUFFOLK & CENTRAL AVES	65	OCP – An OCP case related to dumping that intersection approximately 65 east of the LOD was opened in 2002. The material was cleaned up and the case was closed one month later. Based on the local topography, the site appears downgradient of the LOD.	Low
4,5	YOUNGTAEMIN PROPERTY LLC/ 6113 OLD CENTRAL AVENUE	415	OCP, UST – The facility has seven active and inactive USTs registered to the property. The USTs ranged in size from 1,500-gallons to 3,000-gallons and were excavated and removed from the ground in 2009. Impacted surface media was encountered during the removal of the USTs, which was addressed and the case was closed approximately 1.5 years later. The site appears downgradient of the LOD and directly west of a stream.	Low
6	TOWN OF CAPITOL HEIGHTS MS4/ 1 CAPITOL HEIGHTS BOULEVARD	595	FINDS/FRS – MS4 permit, no violations noted.	Low

LOD ID: WAS-0302	Site Rank: Moderate	Figure Location: 
Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	South side of Central Avenue, at Old Central Avenue	
City	Capitol Heights	
County	Montgomery	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the southern side of Central Avenue (MD 214), at merger with Old Central Avenue (MD 322), in Capitol Heights, Maryland. Portions of the LOD extend north, across Central Avenue, as well as south, across Old Central Avenue. The surrounding area is mixed-use residential and commercial. Residential development started prior to the 1960's, but increased in the 1970's along with commercial development to the north, east, and west. The surrounding area was observed similar to its current configuration by 1989. Several records of concern were identified in the area, the most concerning is a gas station located directly north of the LOD, which the LOD extends up to. This gas station currently has two 12,000-gallon and one 15,000-gallon petroleum USTs present onsite. In addition, in 1998, a 1,000-gallon used oil UST was excavated and removed from the site; however, OCP files pertaining to this case have been destroyed per MDE's file retention protocols. The used oil UST most likely was located adjacent to the structure on the site, approximately 90 feet north of the LOD. In 2014, three former gasoline USTs along with ancillary piping and dispenser islands were excavated, along with 1,490 tons of petroleum impacted soils. A total of 18 confirmation soil samples were collected from the exaction and analyzed for BTEX, naphthalene, and TPH-DRO/GRO, all which were all below their respective MDE non-residential cleanup standard. Based on the analytical data subsurface soil on the site does not appear to be grossly impacted; however, gasoline-impacted soils and groundwater may still remain. Further, information was not available regarding the former used oil UST. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

5	EXXON #25380 6400 CENTRAL AVE	310	<p>UST, OCP – Active gas station with four petroleum USTs ranging in size from 1,000-gallon to 12,000-gallons that were installed in 1984. All but one UST (1,000-gallon used oil UST) are still active on the site. In 1990, a groundwater investigation at the site was conducted that included the installation and sampling of 4 monitoring wells along the perimeter of the site. Groundwater samples were analyzed for BTEX (ND to 10 ug/l) and MTBE (ND to 1,100 ug/l). The groundwater flow direction was determined to be to the southeast, crossgradient of the LOD. In 1996, A 1,000-gallon used oil UST and three hydraulic lifts were excavated and removed from the site. No impacted material was encountered in the excavations and the UST was found to be free of any perforations.</p> <p>SPILLS – Two petroleum releases, one 0.5 gallon and one 25 gallon release have occurred at the site. Both spills were to impervious surfaces and were cleaned up.</p> <p>FINDS/FRS, ICIS, RCRA-CESQG – Air permit, generator of ignitable, lead and benzene waste, no violations noted.</p>	Low
6	PEPCO SPILL/ CENTRAL AVE & ADDISON RD	255	OCP (Spill) – A spill associated with PEPCO at the intersection of the Central Ave and Addison Rd occurred in 2012 and was closed in 2017.	Low
7	Q'S QUALITY CARS LLC/ 6100 E CAPITOL ST	357	OCP, UST – One 500-gallon heating oil UST was excavated and removed from the site in 2016. Impacted subsurface material was encountered during the removal, addressed, and closed approximately 3 months later. Based on local topography, the facility appears downgradient of the LOD.	Low
8	LYDON HILLS ELEMENTARY SCHOOL/ 6181 CENTRAL AVENUE	389	FIND/FRS, OCP, UST – Two 8,000-gallon heating oil USTs are registered to this property. The first UST was closed in 2003 and the second in 2020. Impacted subsurface material was encountered during the removal of both USTs, which was remediated and closed. Based on local topography, the facility appears downgradient of the LOD.	Low
9	QUICK MART - 6002 ACME PLACE	420	FINDS/FRS – Air permit, no violations noted.	Low

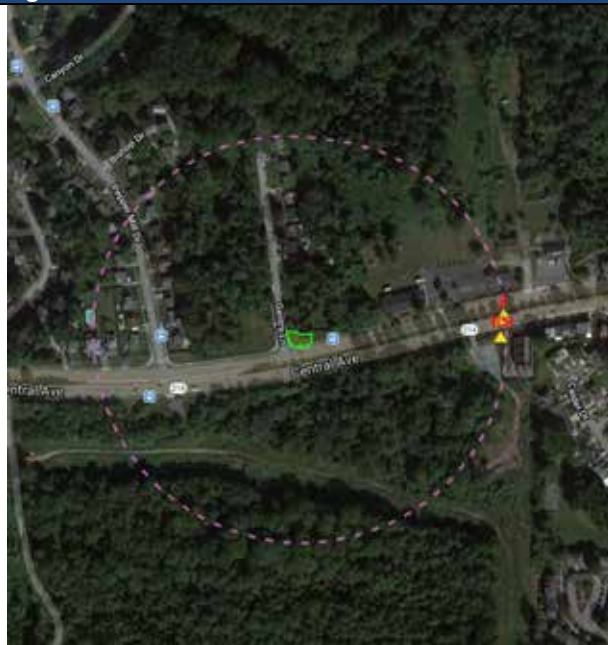

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1960	The surrounding area is primarily residential and vacant land.	Aerial
1981	Additional residential and commercial development is observed in all directions.	Aerial
1989	The surrounding area is observed to be developed close to its current configuration.	Aerial

Ranking Rationale Site Summary		
<p>The LOD is located along the north side of Central Avenue (MD 215), immediately east of Gentry Lane, in Capitol Heights, Maryland. The surrounding area is primarily residential, with the exception of some forest land to the south and a church to the east. The surrounding area was observed to be relatively rural and undeveloped up until the 1970s when additional residential development began to occur to the northwest and east. The surrounding area was observed to be developed in its current configuration in around the late 1980s/early 1990s. No records of concern in the vicinity of the LOD that would have an impact on the LOD were identified during this environmental review.</p>

Ranking Rationale Site Summary		
The LOD is located along the south side of Central Avenue (MD 214), directly south of the intersection with Soper Lane, in Capitol Heights, Maryland. The surrounding area is mixed-use residential/commercial. A metro rail line and station are located to the south along with some residential properties and parkland. The surrounding area was observed to be relatively rural and undeveloped up until the 1970s when residential development began to occur to the northwest and east. Residential and commercial developed up until the early 2010s, when the surrounding area was observed to be developed in its current configuration. No records of concern in the vicinity of the LOD that are believed to impact site were identified during this environmental review.

Watershed:	WAS	
Street Address/Nearest Cross Streets	South side of Pennsylvania Avenue SE, east of Southern Avenue SE	
City	Capitol Heights	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the southern side of Pennsylvania Avenue SE (MD 4), east of Southern Avenue SE, in Capitol Heights, Maryland. The surrounding area is primarily residential, with intermixed commercial properties. Residential development to the north and west began prior to the 1940s, which expanded to the south and east through the 1970s. The LOD and surrounding area was observed in its current configuration by the mid-1980s. Three OCP cases are listed at properties between 210 and 585 feet of the LOD. One facility, an apartment complex located 565 feet northeast, was listed in the UST and OCP databases. Three closed OCP cases are associated with former USTs, one of which was reported to have had a release with associated cleanup activities. Based on the local topography, the facility appears located hydraulically crossgradient of the LOD. The leaking underground storage tank case 210 feet to the southwest appears crossgradient of the LOD. The third case is approximately 585 feet in an apparent upgradient direction of the LOD; however, the case was closed in less than 6 months; therefore, impacts were most likely minor in nature. Thus, impacts to the LOD are unlikely.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	East side of Suitland Road, north of Swann Road	
City	Hillcrest Heights	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the eastern side of Suitland Road (MD 218), north of Swann Road, in Hillcrest Heights, Maryland. A portion of the LOD extends west, across Suitland Road. The surrounding area is primarily residential to the north and east, governmental agencies to the south-southeast, and the Washington National Cemetery to the west and northwest. Based on a review of historical imagery, residential development began by 1940s with additional apartment developments continuing into the 1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. Eighteen facilities were flagged in the database report; however, eight of these were mapped incorrectly and were actually located 800 feet or greater from the LOD. Of the remaining 10 facilities, the closest facility, the Federal Aviation Administration's Suitland Center, located 160 feet from the LOD, had an OCP case opened for the removal of a 2,000-gallon gasoline UST in 1997 which stated a release had not occurred. The remaining facilities, all located 285 feet or greater, were associated with either minor surface releases, UST removals without documented releases, or were at a significant distance from the LOD. Based on the distances, statuses and anticipated hydraulic directions (cross or downgradient), these remaining facilities are unlikely to have an impact on the LOD.</p>

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	SUITLAND ROAD / 4258 SUITLAND ROAD	290	FINDS/FRS, HMIRS – In September 1991, an incident was reported when approximately one quart of heating oil spilled while refilling a UST, which was cleaned up immediately.	Low
2	NOAA SATELLITE OPERATIONS FA / 4231 SUITLAND RD	290	FINDS/FRS – No violations.	Low
3	NATIONAL MARITIME INTELLIGENCE / 4251 SUITLAND RD	1,900	FINDS/FRS, AST, ICIS, OCP, UST, SPILLS, RCRA-CESQG – The site operates 10 ASTs containing various fuels and one 50,000-gallon UST containing diesel fuel. An additional 50,000-gallon UST is identified as temporarily out of use. OCP Case No. 93-0219PG was closed in June 1993 and OCP Case No. 12-0479PG was opened in February 2021 and remains open. A spill was reported in December 2017 when a roll-off truck leaked approximately 1 quart of motor oil. Based on a review of aerial photographs and County property information, the site is located approximately 1,900 feet southeast (crossgradient), not 290 feet as mapped in the database search.	Low
4	FAA SUITLAND CENTER 4213 SUITLAND RD	160	OCP – OCP Case No. 97-1511PG1 was opened in February 1997 and closed in March 1997, which stated no release was discovered. Based on a review of aerial photographs and County property information, the site is located approximately 160 feet southeast (crossgradient), not 290 feet as mapped in the database search.	Low
5	KAY MANAGEMENT / 4212 SUITLAND ROAD	285	UST, OCP – In November 1996, a 2,000-gallon gasoline UST was removed from the ground. OCP Case No. 97-0955PG1 noted no impacted media was encountered and no required cleanup activities occurred. The case was closed in December 1996.	Low
6	FEDERAL AVIATION ADMINISTRATION / 4213 SUITLAND ROAD	160	UST – In February 1997, a 2,000-gallon diesel UST was removed. Based on a review of aerial photographs and County property information, the former UST was located approximately 160 feet southeast (crossgradient) of the LOD, not 285 feet as mapped in the database search.	Low
7	WSSC NEW SUITLAND EL TANK / 4211 SUITLAND RD	285	FINDS/FRS, RCRA-CESQG – No violations.	Low
8	NATIONAL ARCHIVES & RECORDS A / 4205 SUITLAND ROAD	2,400	FINDS/FRS, ICIS, OCP, RCRA-SQG, RCRA-CESQG, UST – One 2,500-gallon diesel fuel UST was removed from the ground in September 2002 and one 3,000-gallon heating oil UST was removed from the ground in November 1992. Two USTs remain in-use. Two closed OCP cases (No. 93-1044PG and No. 99-2119PG1) were closed in January 1998 and February 1999, respectively. Both cases noted impacted media that required cleanup activities. Based on a review of aerial photographs and County property information, the site is located approximately 2,400 feet south (downgradient) of the LOD, not 285 feet as mapped in the database search.	Low

9	SUITLAND FEDERAL CENTER / 4200 SUITLAND RD BLDG 4	2,600	UST, OCP – Three diesel USTs and one kerosene UST were removed from the ground between 1992 and 2010. OCP Case No. 93-1077PG was opened in December 1992 and closed in March 1993. Based on a review of aerial photographs and County property information, the site is located approximately 2,600 feet southeast (downgradient) of the LOD, not 195 feet as mapped in the database search.	Low
10	PEPCO UTILITIES / 4192 SUITLAND RD	2,000	OCP – An OCP case (No. 95-1023PG1) was opened and closed on October 24, 1994, which suggests a minor incident. Based on a review of aerial photographs and County property information, the site is located approximately 2,000 feet north (downgradient), not 265 feet as mapped in the database search.	Low
11	SUITLAND ROAD- 4176A / 4176-A SUITLAND ROAD	285	FINDS/FRS – No violations.	Low
12	WHITEHALL SQUARE APTS / 4176 SUITLAND RD	1,100	OCP – An OCP case (No. 90-1819PG) was opened in March 1990 and closed in May 1990. Based on a review of aerial photographs and County property information, the site is located approximately 1,100 feet north (downgradient), not 285 feet as mapped in the database search.	Low
13	SUITLAND ROAD / 4100-4126 SUITLAND ROAD	285	SPILLS – A spill of sewage was reported in May 2017 flowing from a manhole.	Low
14	SUITLAND FEDERAL CENTER / 4301 SUITLAND ROAD	290	FINDS/FRS – No violations.	Low
15	SUITLAND ROAD, 4130 4130 SUITLAND ROAD	1,600	FINDS/FRS, SPILLS – A spill of No. 2 heating oil from an UST was reported in July 2015. Based on a review of aerial photographs and County property information, the site is located approximately 1,600 feet north (downgradient), not 455 feet as mapped in the database search.	Low
16	WHITEHALL SQUARE APARTMENTS / 4110 SUITLAND ROAD	800	FINDS/FRS, ICIS, OCP, UST – Two 10,000-gallon heating oil USTs were removed from the ground in December 2002 and July 2005. Three heating oil USTs remain in-use. Two OCP cases (No. 03-0836PG1 and 06-0082PG1) were closed in July 2004 and February 2006, respectively, both of which indicated a release and required cleanup activities. A third OCP Case No. 16-0650PG was opened in May 2016 and remains open. Based on a review of aerial photographs and County property information, the site is located approximately 800 feet north (downgradient), not 540 feet as mapped in the database search.	Low

Project Area Site Descriptions

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
17	FEDERAL CENTER HEAT PLANT / 4105 SUITLAND RD	1,200	UST, OCP – Eight USTs containing fuels were removed from the ground between 1997 and 2010. OCP Case No. 94-2723PG1 was closed in February 2006, which indicated impacted media was found and required cleanup activities. OCP Case No. 11-0315PG was closed in February 2011 and indicated no impacted media or cleanup activities were required. Based on a review of aerial photographs and County property information, the site is located approximately 1,200 feet south (downgradient) of the LOD, not 565 feet as mapped in the database search.	Low
18	WASHINGTON NATIONAL CEMETERY / 4101 SUITLAND RD	>400	UST, OCP – One 1,000-gallon gasoline UST was removed from the ground in September 1991. Two OCP Cases (No. 92-0653PG and 10-0494PG) was closed in September 1991 and June 2010, respectively, which indicated no releases or cleanup activities were required. Based on aerial photographs, the closest structure to the LOD on cemetery land is approximately 400 feet. Thus, the former UST is believed to be a minimum of 400 feet from the LOD, not 120 feet as mapped in the database.	Low

HISTORICAL IMAGES SUMMARY

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Along Suitland Road, north of Swann Road	
City	Suitland-Silver Hill	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located the western side of Suitland Road (MD 218), north of Swann Road, in Hillcrest Heights, Maryland. The surrounding area is residential to the northeast and east, governmental agencies to the south-southeast, and the Washington National Cemetery to the north and west. Based on a review of historical imagery, residential development began by 1940s with additional apartment developments continuing into the 1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. Sixteen facilities were flagged in the database report; however, eleven of these were mapped incorrectly and were actually located 500 feet or greater from the LOD. Of the remaining five records, four were associated with either UST removals without releases, were RCRA generators without documented violations, or involved sewage. The lone record that involved a documented release, occurring 320 feet from the LOD, was a release of one quart of heating oil during refilling of an AST. Based on the distance, impacts to the LOD are unlikely.</p>

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	WSSC NEW SUITLAND EL TANK / 4211 SUITLAND RD	310	FINDS/FRS, RCRA-CESQG – Generator of ignitable and non-halogenated solvents, no violations noted. Although the database mapped this location at 5 feet from the LOD, actual distance is approximately 310 feet.	Low

SITE ID: WAS-0317-LOW

Project Area Site Descriptions

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
2, 15	FEDERAL AVIATION ADMINISTRATION / 4213 SUITLAND ROAD	410	<p>UST, OCP – One 2,000-gallon UST containing diesel fuel was removed from the ground in February 1997. OCP Case No. 97-1511PG1 was opened in February 1997 and closed in March 1997, which stated no release was discovered.</p> <p>Based on a review of aerial photographs and County property information, the site is located approximately 410 feet southeast (crossgradient) of the LOD, not 2 feet as mapped in the database search.</p>	Low
3	NATIONAL ARCHIVES & RECORDS A / 4205 SUITLAND ROAD	1,225	<p>FINDS/FRS, ICIS, OCP, RCRA-SQG, RCRA-CESQG, UST – One 2,500-gallon diesel fuel UST was removed from the ground in September 2002 and one 3,000-gallon heating oil UST was removed from the ground in November 1992. Two USTs remain in-use. Two closed OCP cases (No. 93-1044PG and No. 99-2119PG1) were closed in January 1998 and February 1999, respectively. Both cases noted impacted media that required cleanup activities. Based on a review of aerial photographs and County property information, the site is located approximately 1,225 feet south (downgradient) of the LOD.</p>	Low
4	KAY MANAGEMENT / 4212 SUITLAND ROAD	150	<p>UST, OCP – One 2,000-gallon gasoline UST was removed from the ground in November 1996. OCP Case No. 97-0955PG1 noted no impacted media was encountered and no cleanup was required. The case was closed in December 1996. Although the database mapped this location at 25 feet from the LOD, actual distance is believed to be approximately 150 feet.</p>	Low
5	SUITLAND FEDERAL CENTER / 4200 SUITLAND RD BLDG 4	2,900	<p>UST, OCP – Three diesel USTs and one kerosene UST were removed from the ground between 1992 and 2010. OCP Case No. 93-1077PG was opened in December 1992 and closed in March 1993. Based on a review of aerial photographs and County property information, the site is located approximately 2,900 feet southeast (downgradient) of the LOD, not 25 feet as mapped in the database search.</p>	Low
6	PEPCO UTILITIES / 4192 SUITLAND RD	1,800	<p>OCP – An OCP case (No. 95-1023PG1) was opened and closed on October 24, 1994, which suggests a minor incident. Based on a review of aerial photographs and County property information, the site is located approximately 1,800 feet north (downgradient) of the LOD, not 25 feet as mapped in the database search.</p>	Low
7	SUITLAND ROAD- 4176A / 4176-A SUITLAND ROAD	1,600	<p>FINDS/FRS – Minor air permit, no violations noted. Based on a review of aerial photographs, the site is located approximately 1,600 feet west (crossgradient) of the LOD, not 25 feet as mapped in the database search.</p>	Low
8	WHITEHALL SQUARE APTS 4176 SUITLAND RD	1,665	<p>OCP – An OCP case (No. 90-1819PG) was opened in March 1990 and closed in May 1990. Based on a review of aerial photographs and County property information, the site is located approximately 1,500 feet north (downgradient).</p>	Low

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
9	SUITLAND ROAD, 4130 SUITLAND ROAD	1,500	FINDS/FRS, SPILLS – A spill of No. 2 heating oil from an UST was reported in July 2015. Based on a review of aerial photographs and County property information, the site is located approximately 1,500 feet north (downgradient).	Low
10	WHITEHALL SQUARE APARTMENTS / 4110 SUITLAND ROAD	500	FINDS/FRS, ICIS, OCP, UST – Two 10,000-gallon heating oil USTs were removed from the ground in December 2002 and July 2005. Three heating oil USTs remain in-use. Two OCP cases (No. 03-0836PG1 and 06-0082PG1) were closed in July 2004 and February 2006, respectively, both of which indicated a release and required cleanup activities. A third OCP Case No. 16-0650PG was opened in May 2016 and remains open. Based on a review of aerial photographs and County property information, the site is located approximately 500 feet north (downgradient) of the LOD.	Low
11	UNKNOWN / 4100- 4126 SUITLAND RD	95	SPILLS – A spill of sewage was reported in May 2017 from a manhole. Sewage is not considered a contaminant of concern for this evaluation.	Low
12	FEDERAL CENTER HEAT PLANT / 4105 SUITLAND RD	660	UST, OCP – Eight USTs containing fuels were removed from the ground between 1997 and 2010. OCP Case No. 94-2723PG1 was closed in February 2006, which indicated impacted media was found and required cleanup activities. OCP Case No. 11-0315PG was closed in February 2011 and indicated no impacted media or cleanup activities were required. Based on a review of aerial photographs and County property information, the site is located approximately 660 feet south (downgradient) of the LOD.	Low
13	WASHINGTON NATIONAL CEMETERY / 4101 SUITLAND RD	800	UST, OCP – One 1,000-gallon gasoline UST was removed from the ground in September 1991. Two OCP Cases (No. 92-0653PG and 10-0494PG) was closed in September 1991 and June 2010, respectively, which indicated no releases or cleanup activities were required. Based on a review of aerial photographs, the site is located approximately 800 feet south (upgradient) of the LOD, not 285 feet as mapped in the database search.	Low
14	NOAA SATELLITE OPERATIONS FA / 4231 SUITLAND RD	950	OCP – Opened in 1997 for unknown purposes, the record states a release had not occurred. The OCP case was closed approximately 2 weeks later. Based on a review of aerial photographs, the site is located approximately 950 feet south (upgradient) of the LOD, not 125 feet as mapped in the database search.	Low

SITE ID: WAS-0317-LOW

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
16	NATIONAL MARITIME INTELLIGENCE / 4251 SUITLAND RD	2,000	FINDS/FRS, AST, ICIS, OCP, UST, SPILLS, RCRA-CESQG – The site operates 10 ASTs containing various fuels and one 50,000-gallon UST containing diesel fuel. An additional 50,000-gallon UST is identified as temporarily out of use. OCP Case No. 93-0219PG was closed in June 1993 and OCP Case No. 12-0479PG was opened in February 2021 and remains open. A spill was reported in December 2017 when a roll-off truck leaked approximately 1 quart of motor oil. Based on a review of aerial photographs and County property information, the site is located approximately 2,000 feet southeast (crossgradient) of the LOD.	Low
17	SUITLAND ROAD / 4258 SUITLAND ROAD	320	FINDS/FRS, HMIRS – An incident was reported in September 1991 when approximately one quart of heating oil spilled while refilling a UST, which was cleaned up immediately.	Low

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1959	Suitland Road is visible. The surrounding area appears to be residential to the south and east. Washington National Cemetery is observed to the west-northwest.	Aerial
1970	The apartment complex to the north is observed and the areas to the south are observed to be governmental buildings.	Aerial
1981	The LOD and surrounding area are observed to be developed in their current configuration.	Aerial

Watershed:	WAS	
Street Address/Nearest Cross Streets	Eastern side of Branch Avenue, south of Southern Avenue SE	
City	Hillcrest Heights	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the eastern portion of Branch Avenue (MD 5), south of Southern Avenue SE, in Hillcrest Heights, Maryland. The surrounding area is primarily residential, especially to the east, west and north, across the border into Washington D.C. Based on a review of historical imagery, residential development began before the 1940s with additional apartment developments continuing into the 1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. The only records of concern were two closed OCP cases, located 600 feet southwest (crossgradient) from the LOD, associated with the closure of an UST and installation of a new UST. Based on distance and hydraulic direction, impacts to the LOD from this UST site is unlikely.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Along Indian Head Highway, north of Livingston Road	
City	Oxon Hill	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the eastern side of Indian Head Highway (MD 210), in a median formed by the Indian Head Highway, Livingston Road and Indian Head Highway Service Road, in Oxon Hill, Maryland. The surrounding area is primarily commercial properties, which begin prior to 1959. The surrounding area is observed to be in its current configuration by 1988. The surrounding area includes two gas stations and several autobody shops. Several records of concern were identified in the surrounding area including OCP cases, USTs, and SPILLS. A former gas station is located approximately 70 feet southeast of the LOD. A PIA request was submitted to MDE for further information; however, no files related to the removal of the USTs was provided, only a summary of the USTs and their status. Two other gas stations are located approximately 225 feet northeast and northwest of the LOD. Both sites have had reported releases to soil and groundwater, as well as free product was identified at the gas station to the northwest. Based on the proximity of the current and former gas to stations with respect to the LOD, impacts to the LOD cannot be ruled out. Thus, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Foundation Christian School 5410 Indian Head Highway, Oxon Hill, MD	30	FINDS/FRS – National compliance database listing.	Low
2	Woodrow Wilson Bridge Project/ 6600 Indian Head Highway Oxon Hill, MD	50	FINDS/FRS, ICIS – NPDES permit.	Low
3	Amoco Oil Company 5021 Livingston Road Oxon Hill, MD	70	UST – Previously, the site operated five USTs that ranged in size from 2,500 to 3,000 gallons. The tanks all held gasoline. All tanks are now permanently out of service; however, the date of removal is unknown. Based on local topography the site appears up- to crossgradient from the LOD. A PIA request was submitted to MDE for further information; however, no files related to the removal of the USTs were provided, only a summary of the USTs and their status.	High
4	Goodyear Auto Service Center 5406 Indian Head Highway Oxon Hill, MD	120	FINDS/FRS, RCRA SQG – There are no violation records associated with this facility	Low
5	Mobil/ Xotic Sports/ Maleha Bahich Property/ Autocare 5400 Indian Head Highway Oxon Hill, MD	255	<p>FINDS/FRS – Minor air permit</p> <p>UST, OCP – Previously eight USTs operated at this site. The USTs ranged in size from 1,000 to 8,000 gallons. All tanks are permanently out of use and have been removed from the ground.</p> <p>1994 – Four out of service UST was observed on the site and received several NOV's between 1994 and 2002 for not addressing the USTs. In 2007, four USTs ranging from 550-gallons to 10,000-gallons were excavated and removed from the site along with 355 tons of impacted soil. Sixteen confirmation samples were collected and only one sample exceeded the MDE action level for TPH-GRO at 810 mg/kg. In 2007, four additional USTs ranging in size from 1,000-gallons to 3,000-gallons were excavated and removed from the site along with 621 additional tons of impacted soil. Twelve confirmation samples were collected and analyzed for TPH-DRO/GRO and VOCs, none of which exceeded their corresponding non-residential action levels.</p> <p>Based on local topography the site appears crossgradient of the LOD.</p>	Moderate

Project Area Site Descriptions

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
6	Eastover Pure/ Chevron 5401 Indian Head Highway Oxon Hill, MD	265	<p>UST, OCP – Three USTs are currently in use and three are permanently out of use at the site. The tanks in use are all 10,000 gallons and hold diesel or gasohol.</p> <p>1991 – A site assessment was conducted that included the installation of 5 monitoring wells that were analyzed for petroleum constituents. Detected concentrations of MTBE (ND to 12,000 ug/l) and Total BTEX (ND to 700 ug/l). September 1994, which showed decreasing levels of MTBE and BTEX, as well as impacted groundwater was not flowing offsite. The case received closure in 1994 and the wells were abandoned in 1995.</p> <p>2002 – An OCP case was opened in response to a compliance inspection that identified several administrative and mechanical deficiencies, which were subsequently addressed and the case was closed several months later.</p> <p>2011 – The facility has been cited for numerous violations and still being addressed. During the removal of 1,000-gallon heating oil UST and 550-gallon used oil UST in December 2015 as part of correcting the violations and deficiencies, free product was encountered in the excavation, as well as underneath concrete holding tank connected to floor drains in service bays. In 2016, a subsurface investigation was conducted that included six soil borings. Soil samples exhibiting the highest PID readings (up to 819 ppm) were analyzed for TPH-GRO and VOCs. A sample from SB-3 had a detected concentration of TPH-GRO (2,030 mg/kg) above MDE non-residential action level of 620 mg/kg. Three of the soil borings were completed as temporary monitoring wells and analyzed for TPH-GRO (1,970 ug/l to 38,700 ug/l), benzene (12.4 ug/l to 218 ug/l), toluene (ND to 3,340 ug/l), ethylbenzene (66.4 ug/l to 1,010 ug/l), xylenes (15.7 ug/l to 4,140 ug/l), MTBE (ND to 44.7 ug/l), naphthalene (19.1 ug/l to 149 ug/l). Groundwater flow was inferred to flow towards the northwest, away from the LOD. The case is still open due</p> <p>FINDS/FRS RCRA SQG – Minor air permit and RCRA SQG. There are no violation records associated with this facility.</p> <p>SPILLS – In 2019, an unknown amount of gasoline was spilled after failing the second line test. No cleanup information is provided.</p> <p>Based on local topography the site appears downgradient from the LOD.</p>	Moderate

Watershed:	WAS	
Street Address/Nearest Cross Streets	Northeast portion of St. Barnabas Road and Branch Avenue interchange	
City	Marlow Heights	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the northeast portion of St. Barnabas Road (MD 414) and Branch Avenue (MD 5) interchange, in Marlow Heights, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are primarily located to the east and south of Branch Avenue, while commercial developments are located to the north and west beyond St. Barnabas Road. Based on a review of historical imagery, residential development began in the 1940s with commercial developments continuing into the 1960s/1970s. The LOD and surrounding area was observed to be developed in its current configuration by the early 1980s. Two SPILLS incidents listed at 500 and 610 feet from the LOD were associated with disposal of trash on a vacant lot and a 10-gallon release of mineral oil, respectively. Based on distances, hydraulic direction and case statuses, impacts to the LOD from these incidents are unlikely.</p>

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the northern side of Branch Avenue (MD 5) east of the St. Barnabas Road (MD 414) interchange, in Marlow Heights, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are primarily located to the north and south, while commercial developments are located to the north and west, beyond St. Barnabas Road. Based on a review of historical imagery, residential development began in the 1940s with commercial developments continuing into the 1960s/1970s. The LOD and surrounding area was observed in its current configuration by the early 1980s. Two records of concern were identified. The first record, associated with the Branch Avenue overpass for St. Barnabas Road, was listed as a RCRA LQG for lead abatement. Based on surface topography, any prior lead leaching would not have been directed towards the LOD. The second record, a SPILLS incident occurring 660 feet northeast from the LOD, involved the release of 10 gallons of mineral oil when a vehicle hit a transformer. Based on the distance of this incident, impacts to the LOD are unlikely.</p>

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD stretches along St Barnabas Road (MD 414), at the on/off ramps to Branch Avenue (MD 5), in Hillcrest Heights, Maryland. The surrounding area is mixed use residential/commercial developments, which begin prior to 1949. Beginning in the late 1950s commercial development to the west and south began, as well as residential development to the east and continued through 1998 when the surrounding area was observed in its current configuration. Although the area surrounding the LOD includes ten sites with environmental concerns, most sites are located more than 300 feet downgradient or crossgradient from the LOD where impacts to the LOD are unlikely. A former Kmart is located approximately 315 feet crossgradient of the LOD, which had a 1,000-gallon used oil UST excavated and removed in 1990 and a 550-gallon grit chamber for an oil/water separator excavated and removed in 2004. Information provided in the database report did not state whether a release had occurred or not for the 1,000-gallon UST and a request to MDE for additional information determined their files had been deleted. Available records for the closure of the oil/water separator indicated that the surrounding area had not been impacted based on analytical results from soil samples collected and analyzed for petroleum constituents, all of which were non-detect. Regardless, as the former USTs are located hydraulically crossgradient of the LOD, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the east side of Indian Head Highway (MD 210), south of Livingston Road, in Oxon Hill, Maryland. The surrounding area is primarily residential, which began prior to 1949 and continued through 2005, when the surrounding area was observed in its current configuration. Two OCP cases and a spill case located approximately 210 and 450 feet northeast (downgradient) of the LOD were listed in the environmental database report. Both sites were found to have impacted subsurface media. The site approximately 210 feet to the northeast of the LOD involved a leaking residential 550-gallon heating oil UST which was closed in-place in 1996. An AST was installed in its place and was subsequently removed in 2013, when 1-gallon of heating was found to have leaked from the tank. The site approximately 450 feet northeast of the LOD involved a leaking 2,000-gallon heating oil UST associated with a local government building in 1993. Based on available information provided by MDE through a PIA request, both sites were closed by MDE and the owners of both sites were allowed to leave impacted material in-place; however, both sites are believed to be downgradient of the LOD. Based on distance and hydraulic direction, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Depeazer Property 5516 Arapahoe Drive Oxon Hill, MD	210	<p>OCP – In 1996, an OCP case was opened due to product being observed in the basement sump as the 550-gallon heating oil UST was being filled. MDE instructed the resident to pump the UST clean and abandon it in-place. An AST was installed in its place. The case was closed within one month.</p> <p>SPILLS – In 2013, 1 gallon of No. 2 residential heating oil leaked from a 275 gallon AST onto the ground. The spill was contained and the tank is was pumped out and replaced.</p> <p>The was listed as being 170 feet northeast of the LOD; however, after further review, the site is actually 210 feet northeast (downgradient) of the LOD.</p>	Low
2	Town of Forest Heights 5508 Arapahoe Drive Oxon Hill, MD	450	<p>UST, OCP – In 1993, a 2,000-gallon heating oil UST was excavated and removed from the site. Perforations were observed on the walls of the UST and free product was observed in the excavation. A truck load of contaminated soil was excavated and removed from the site and excavation was backfilled. In 1994, a trench was dug approximately 8 feet long and 8 to 9 feet deep adjacent to the former UST and the soil were checked for petroleum odors, none of which were found. It was then concluded that any impacted material was isolated to the property. The case received closure approximately 7 years later.</p> <p>UST – A 2,000 gallon gasoline UST was previously in use at the site. The tank has been removed from the ground.</p> <p>The was listed as being 255 feet northeast of the LOD; however, after further review, the site is actually 450 feet northeast (downgradient) of the LOD.</p>	Low

Street Address/Nearest Cross Streets	Along Indian Head Highway, southeast of Southern Avenue SE	
City	Oxon Hill	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the ROWs along Indian Head Highway (MD 210), between Southern Avenue SE and Audrey Lane, in Oxon Hill, Maryland. The surrounding area is a mix of residential and commercial developments. Commercial and residential development begin prior to 1949, and is observed in its current configuration by 2005. The surrounding area consists of two gas stations, two drycleaners and additional commercial buildings. Seventeen records of concern, all within 555 feet of the LOD, were listed on one or more environmental database. The facility with the greatest concern, a gas station located along the eastern side of the LOD, has documented petroleum impacts present in soil and groundwater beneath the site. Analytical data from investigations conducted in 2002 and 2003 indicate that most of the impacts are present in the north-central portion of the site; however, it is possible that impacts have migrated beneath the LOD. Another facility of concern, a former drycleaner located adjacent to the southern LOD extent, was listed as a RCRA-CESGQ database. No releases were reported, and a request for available records submitted to MDE was returned stating no files available. The remaining 15 sites are not expected to have impacted the LOD. Based on the documented releases associated with the gas station, and potential impacts from the former dry-cleaner, further investigation is warranted to determine whether or not impacts from these two sites have impacted environmental media within the LOD.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
18	AMOCO 4900 Indian Head Highway Oxon Hill, MD	60	<p>OCP – Three OCP cases have been opened at the site. One during a tank closure which involved a release and cleanup efforts. It is unknown whether releases occurred in the other two cases. All cases have been closed.</p> <p>UST – Eight USTs are permanently out of use at the site and have been removed from the ground. The USTs ranged in size from 550 to 8,000 gallons, containing heating oil, used oil or gasoline.</p> <p>2002 – Three 8,000-gallon gasoline USTs, one 550-gallon heating oil UST, one 550-gallon used oil UST were excavated and removed from the site. A 4,000-gallon unidentified UST found during the removal of the five USTs summarized above, as well as an oil/water separator, were properly abandoned in place. Approximately 200 tons of impacted soil was excavated and disposed of offsite. Oily water found in the excavation was treated through an active carbon treatment system and then discharged to the local sewer per the site's discharge permit. Eight soil borings, two of which were completed as monitoring wells were advanced at the site. A sheen was observed on water extracted from the monitoring well in the central portion of the site, directly south of the former tank pit, in January 2003; however, no sheen was observed in February 2003. Based on the analytical results, impacted soil and groundwater appear to be located mainly in the central and western portions of the site. Petroleum constituents were detected below MDE action levels in the soil boring and groundwater samples in the southern portion of the site nearest the LOD; however, it is possible that residual petroleum impacts could be present within the boundary of the LOD.</p>	High
19,20,21	5209 Indian Head Highway Oxon Hill, MD	130	<p>SPIILLS – In October 2013, a vault transformer developed a leak, releasing approximately 30 gallons of transformer oil. The spill was contained to the vault.</p> <p>UST, OCP – In July 1994, an OCP case was opened for the removal of a 10,000-gallon heating oil UST. No release or cleanup activities were documented. The case was closed a month later in August 1994. The site is believed to be downgradient of LOD.</p>	Low
22	5231 Indian Head Highway Oxon Hill, MD	200	FINDS/FRS, ICIS – NPDES permit non-major, no violations noted.	Low
23	South Capital Shell 4700 S Capital Street Washington, DC	225	FINDS/FRS, ICIS – Minor air permit, several compliance violations noted.	Low

Street Address/Nearest Cross Streets	Along I-95, between the on/off ramps from St Barnabas Road (MD 414)	
City	Oxon Hill	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along I-95, east of the onramp from St Barnabas Road (MD 414) to I-95, in Oxon Hill, Maryland. The surrounding area is comprised of the I-95/St Barnabas Road interchange, forested land and some commercial and residential properties. Development of the surrounding area is observed to begin prior to 1949. The surrounding area is observed to be in its current configuration by 1998. There are two OCP cases located 385 feet or greater to the east of the LOD. Both cases were opened for vehicular accidents and have since been closed and are believed to be crossgradient/downgradient of the LOD. Thus, impacts to the LOD from these incidents are unlikely.</p>

Street Address/Nearest Cross Streets	Along the offramp from I-495 at St. Barnabas Road (MD 414)	
City	Oxon Hill	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the offramp from I-495 at St Barnabas Road (MD 414), in Oxon Hill, Maryland. The surrounding area is observed to be mixed use residential commercial development, along with Interstate I-495 to the south. Commercial and residential development is observed to begin prior to 1949 and continued through 1998, when the surrounding area was observed to be developed in its current configuration. The LOD is surrounded by two gas stations to the northeast and several apartment complexes to the west which, all have environmental concerns. Both gas stations have USTs onsite that are currently in use and have had multiple spills and OCP cases. An Exxon gas station is approximately 150 feet northeast of the LOD. All other sites are over 500 feet from the LOD. Thus, impacts to the LOD are unlikely. Based on available information provided by MDE through a PIA request for Exxon Station, a 1,000-gallon heating oil UST and 1,000-gallon used oil UST were excavated and removed from the site. Approximately 27 tons of impacted subsurface material from the excavation, as well as another ton of impacted material from underneath the product lines was disposed of offsite. Confirmation soil samples were collected and analyzed for TPH, VOCs, and metals, all of which were below MDE action levels. The case received closure in August 1999. In December 1999, hydraulic lifts, and oil/water separator, and dispenser islands were removed during renovations. Approximately 1036 tons of impacted soil around the former equipment was excavated and disposed of offsite. Soil samples from the site indicated that substantial petroleum impacts were present in soil and groundwater at the site. Based on available data, BTEX and MTBE exceed their corresponding MDE action levels including maximum detections of benzene at 1,200 ug/l, BTEX at 3,857 ug/l, and MTBE at 15,300 ug/l. Groundwater offsite is believed to have not been characterized; however, previous investigations indicate that groundwater is flowing south to north, away from the LOD. In 2002 the case received closure since MDE believed the contamination present onsite did not pose a threat to health or the environment. Based on the local groundwater flow, impacts to the LOD are unlikely.</p>

5	Shell Service Station 5604 Saint Barnabas Road Oxon Hill, MD	500	<p>UST, OCP – The site has three USTs currently in use, ranging from 12,000 gallons to 15,000 gallons in size.</p> <p>1993 – Impacted soils were identified around the tank field and product lines. Approximately truckloads of impacted material was excavated and disposed of offsite. Soil samples were collected between 0.5 and 7 feet bgs from 5 locations and analyzed for TPH and BTEX, all of which were non-detect. The case was closed approximately 3 months later.</p> <p>1996 – A 550-gallon heating oil UST and 550-gallon used oil UST were excavated and removed from the site in 1996. No perforations were observed on the UST, as well as no odors or impacted soils were encountered. The MDE inspector onsite instructed the facility to backfill the excavation(s) and the case was closed approximately 2 months later.</p> <p>1999 - The case was opened in March 1999 as a result of a tank test failure of the mid-grade gasoline underground storage tank (UST) system. Structural repairs were made to the UST, and several direct push investigations and monitoring well installations were conducted. Liquid phase hydrocarbons (LPH) were detected in monitoring wells RW-2 and RW-4. A temporary recovery system was installed in August 2000 and operated until October 2000. A trailer mounted pump-and-treat/soil vapor extraction (SVE) system was initiated in February 2001 and operated until April 2004 when a new trailer was mobilized to the site. The system was restarted in August 2004 and operated until August 2005 when a trial system shutdown was conducted. The system was restarted in July 2007 due to rebound of dissolved phase petroleum constituent levels and operated until September 2009. The Department approved a trial system shutdown in December 2009. Levels of dissolved phase petroleum constituents did not rebound during the second trial system shutdown. Based on available data, benzene was detected as high as 7,500 ug/l, 7,160 ug/l for BTEX, and 70,000 ug/l for MTBE. The case received closure in 2011, since drinking water to the surrounding properties was supplied by the local public water supply agency, as well as there were known pathways of exposure.</p> <p>2014 – One 6,000-gallon, one 8,000-gallon, and one 10,000-gallon petroleum UST were excavated and removed from the site. PID readings from 14 ft bgs were greater than 2,000 ppm; however, PID readings from 17 ft bgs were around 60 ppm. A total of 1,640 tons of petroleum impact soil was excavated and removed from the site. Eighteen soil samples were collected from the bottom of the excavation (18 ft bgs), from 2ft bgs underneath the dispensers, and along the</p>	Low

Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the central median for I-95/ I-495, east of the overpass for St Barnabas Road (MD 414), in Oxon Hill, Maryland. The surrounding area is primarily forested land with some residential properties and transportation infrastructure. Residential development began prior to 1949, and the surrounding area is observed in its current configuration by 1988. Three OCP cases and a RCRA LQG are located within the vicinity of the LOD. Two OCP cases approximately 185 feet west (crossgradient) of the LOD, were opened due to vehicular accidents, both involved releases and cleanup efforts and were closed between 3 weeks and 1.5 months after being opened. The releases would have been surficial to an impervious surface (the roadway) and was cleaned up. The RCRA LQG record is associated with the overpass of St Barnabas overpass for lead generation. Impacts to the LOD from these records are unlikely.</p>

6,8	Maria Avalos Residence/ 5815 Glen Rock Avenue Oxon Hill, MD	610	<p>OCP – In 2013, and OCP case was opened for a residential heating oil AST leak. A release occurred however; no cleanup actions are noted. The case was closed eighteen months later.</p> <p>SPILLS – In 2013, 50 gallons of No. 2 residential heating oil was spilled from an outdoor tank. Corrective actions were taken.</p> <p>Based on local topography the site is believed to be downgradient of the LOD.</p>	Low
7	Oxon Hill Village Apartments 2121 Alice Avenue Oxon Hill, MD	620	<p>OCP – There have been two OCP cases at this site. Both cases were opened during commercial heating oil tank closures. One case did not involve a release, while it is unknown whether a release occurred in the other.</p> <p>UST – Previously two 6,000 gallon heating oil USTs were operated at the site. Both tank are permanently out of use and have been removed from the ground.</p> <p>FINDS/FRS – Minor air permit; no violations were identified during this review.</p>	Low

Street Address/Nearest Cross Streets	Along Branch Ave, west of the St Barnabas Road overpass	
City	Temple Hills	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the ROW along Branch Ave (MD 5), immediately west of the St Barnabas Road (MD 414) overpass, in Temple Hills, Maryland. The surrounding area is primarily commercial developments with some residential properties. Commercial and residential development began prior to 1949, and is observed in its current configuration by 1988. There are several records of concern in the vicinity of the LOD, the closest being a RCRA LQG listing associated with lead abatement of the St Barnabas Road overpass. Based on the layout of the roadway system, any leaching of lead from the overpass would not be directed toward the LOD. The remaining records were either for a minor air permit or were facilities mapped as being 510 feet or greater from the LOD. Thus, impacts to the LOD from these incidents are unlikely.</p>

Street Address/Nearest Cross Streets	Southeast portion of St. Barnabas Road and Branch Avenue interchange	
City	Marlow Heights	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the southeast portion of the St. Barnabas Road (MD 414) and Branch Avenue (MD 5) interchange, in Marlow Heights, Maryland. The surrounding area is mixed-use residential/commercial. Residential properties are primarily south and east with commercial properties to the west and north beyond the interchange with Branch Avenue. Based on a review of historical imagery, residential development began in the 1940s with commercial development continuing into the 1960s/1970s. The LOD and surrounding area were observed to be developed in its current configuration by the early 1980s. Two inactive drycleaners and a VCP site are located between 330 and 475 feet southwest (downgradient) of the LOD. Two closed OCP cases are associated with an active gas station located approximately 260 feet southwest (downgradient) of the LOD. Subsurface impacts to groundwater were confirmed at the gas station and a former drycleaner; however, as all these sites appear downgradient of the LOD, impacts to the LOD are unlikely.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	NE corner of Indian Head Highway and Palmer Road intersection	
City	Fort Washington	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located in the northeast corner of the intersection of Indian Head Highway (MD 210) and Palmer Road, in Fort Washington, Maryland. The surrounding area is semi-rural with commercial and residential development, which began prior to 1970. The surrounding area is observed in its current configuration prior to 1998. In 1998, an OCP case was opened for the closure of 550-gallon heating oil UST at nursery school approximately 315 feet to the southeast (crossgradient). During the removal of the UST, impacted material was encountered that was addressed and the case was closed approximately 6 months later. Several other sites between 130 and 455 feet of the LOD were identified in the environmental database report; however, based on their hydraulic direction from the LOD (down-/crossgradient) or the type of environmental database record associated with the site (e.g. RCRA generator with no violations), impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Indian Head Highway (MD 210), between Livingston Road and Old Fort Road, in Fort Washington, Maryland. The surrounding area is mixed-used commercial and residential, which began in the 1960s and continued through 2009 when the surrounding area was observed in its current configuration. Several facilities of concern with current/former UST and OCP cases were identified; however, all sites were located between 300 and 595 feet from the LOD and in a hydraulically cross- to downgradient direction. Based on the distances and hydraulic direction, impacts from these sites are unlikely.</p>

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the southern side of Oxon Hill Road (MD 414), between Livingston Road and Thompson Lane, in Oxon Hill, Maryland. The surrounding area is mainly commercial properties, with the exception of an apartment complex approximately 315 feet northwest of the LOD. Commercial development is observed to have begun prior to 1963 and continued through 1998, when the surrounding area was observed in its current configuration. A former dry-cleaner with no reported releases or violations is located approximately 385 feet to the north (crossgradient). The apartment complex to the northwest (downgradient) had an OCP case opened in 1991, for the removal of one 6,000 gallon and one 10,000 gallon heating oil UST. Based on available data provided by MDE through a PIA request, visible perforations were observed on the 6,000-gallon UST. MDE requested that two monitoring wells be installed adjacent to the UST and checked for odor and free product, none of which were encountered. The case was closed approximately 2-months later. Based on the hydraulic direction of these records from the LOD (cross- to downgradient) impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the southern side of Oxon Hill Road (MD 414), west of Thompson Lane, in Oxon Hill, Maryland. The surrounding area is primarily commercial developments which began in 1963. The surrounding area is observed to be in its current configuration in 1998. Several records of concern in the surrounding area were identified. A CVS, mapped at 90 feet from the LOD, was listed as a RCRA LQG, however, there were no violations associated with this operation. A former drycleaner, mapped at 260 feet from the LOD, was listed as inactive. Based on local topography, this former drycleaner is crossgradient from the LOD. All other records were either for minor air permits or were located at a significant distance from the LOD. Based on this info, impacts to the LOD are unlikely.</p>

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Indian Head Highway (MD 210), north of Fort Washington Road, in Fort Washington, Maryland. The surrounding area features forested land to the north and east, and commercial properties to the south and west. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the south. Commercial development continued up until approximately 1988, when the surrounding area was observed to be developed in its current configuration. Three facilities of concern were flagged for being on one or more environmental databases. The closest, a shopping center located to the west (downgradient) of the LOD, had two 5,000-gallon heating oil USTs previously abandoned in-place excavated and removed from the site in 1995. No impacted soil was observed in the excavation and the OCP case was closed approximately one month later. A former drycleaner previously existed at the shopping center, but no violations or documented releases are associated with this former drycleaner. An Exxon gas station with a history of environmental issues was listed; however, it is located at a distance of 645 feet from the LOD in a hydraulically downgradient direction. Based on the information summarized above, impacts to the LOD are unlikely from these facilities.</p>

Project Area Site Descriptions

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1,2	Tantallon Center/ 10701-07 Indian Head Highway, Fort Washington	100	UST, OCP – Based on information provided by MDE through a PIA request, two 5,000-gallon heating oil USTs installed in 1975, that had been abandoned in-place and filled with sand were excavated and removed from the site in 1995. No impacted soil was observed in the excavation; therefore, the MDE inspector onsite instructed the contractor to backfill the excavation and dispose of the USTs and interstitial sand at an offsite regulated facility. The case was closed approximately one month later. that was excavated and removed in 1995. Based on the local topography, the site appears downgradient of the LOD.	Low
3	State Cleaners/ 10753 Indian Head Highway Fort Washington	445	<p>DRYCLEANERS, FED DRYCLEANERS – The facility is listed as an inactive dry cleaning facility. The site was listed as being 115 feet south of the LOD; however, after further review the former facility is actually 445 feet southwest (downgradient of the LOD).</p> <p>FINDS/FRS – Minor air permit.</p> <p>RCRA SQG – No violations.</p>	Low
4	Exxon Gas Station #24617, 10815 Indian Head Hwy	645	<p>FINDS/FRS – Minor air permit.</p> <p>OCP, UST – The facility is a gas station that has been present since 1982 and currently has one 6,000-gallon and one 10,000-gallon gasoline UST, as well as a 1,000-gallon heating oil UST.</p> <p>1991 – An OCP case was opened after the 6,000-gallon heating oil UST failed a pressure test. Subsequently it was found that there was a pressure leak in the dispenser and no release had occurred, the dispenser was repaired and the case was closed.</p> <p>1994 to 1997 – A 1,000-gallon used oil UST, 1,000-gallon heating oil UST and three hydraulic lifts were excavated/removed from the facility. Approximately 539 tons of impacted soil was excavated and removed from the site, most coming from around the hydraulic lifts and used oil UST. Soil samples collected and analyzed for TPH-DRO/GRO, BTEX, PCBs, and Metals identified isolated impacts around the former hydraulic lifts (TPH-DRO 100 to 2,100 mg/kg). MDE requested that three monitoring wells be advanced at the site and analyzed for petroleum constituents. Based on the results of the investigation, benzene (6 ug/ and 780 ug/l), toluene (12 ug/l), ethylbenzene (610 ug/l), xylenes (320 ug/l), MTBE (14,000 ug/l and 15,000 ug/l), TPH-GRO (8 and 12 mg/l) and TPH-DRO (1 to 6.1 mg/L) were detected primarily in MW-3 (south portion of the site), as well as lower detections in MW-1 (northwestern portion of the site). Based on a groundwater</p>	Low

Ranking Rationale Site Summary		
<p>The LOD is located along the eastern side of Indian Head Highway (MD 210), north of Fort Washington Road, in Fort Washington, Maryland. The surrounding area features forested land to the north and east, and commercial properties to the south and west. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the west. The surrounding area was observed to be in its current configuration around 1988. Several facilities of concern were identified in the surrounding area. The closest of which is a gas station with a history of environmental issues; however, this gas station is located hydraulically downgradient of the LOD. A shopping center, the Tantallon Center, had two 5,000-gallon heating oil USTs previously abandoned in-place excavated and removed from the site in 1995. No impacted soil was observed in the excavation and the OCP case was closed approximately one month later. A former drycleaner previously existed at the shopping center, but no violations or documented releases are associated with this former drycleaner. The remaining facilities are located beyond 500 feet from the LOD are thus are unlikely to have an impact on the LOD.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the south side of Fort Washington Road, west of Indian Head Highway (MD 210), in Fort Washington, Maryland. The surrounding area is primarily commercial properties. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the north and continued through 1988, when the surrounding area was observed in its current configuration. Two gas stations and a former drycleaner are located between 70 feet and 605 feet north/ northwest of the LOD. The Exxon gas station located approximately 70 feet north (upgradient) of the LOD has a history of environmental issues. Based on information provided by MDE, a 1,000-gallon used oil UST, a 1,000-gallon heating oil UST and three hydraulic lifts were excavated/removed from the facility in 1996. Approximately 539 tons of impacted soil was excavated and removed from the site, most coming from around the hydraulic lifts and used oil UST. Soil samples identified isolated impacts around the former hydraulic lifts. MDE requested that three monitoring wells be advanced at the site and analyzed for petroleum constituents. Based on the results of the investigation, groundwater impacts were detected primarily in the southern portion of the site, as well as lower detections in the northwestern portion of the site. Based on a groundwater elevation survey, the hydraulic gradient is to the southwest (towards the LOD). The case received closure from MDE in 1998. The gas station 195 feet to the northwest, as well as the former drycleaner approximately 605 feet to the north are believed to be crossgradient of the of the LOD. Based on the upgradient location of the Exxon gas station, approximately 70 feet to the north of the LOD, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

Street Address/Nearest Cross Streets	West side of Indian Head Highway, south of Fort Washington Road	
City	Fort Washington	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Indian Head Highway (MD 210), south of Fort Washington Road, in Fort Washington, Maryland. The surrounding area is primarily commercial properties. The surrounding area was primarily rural agricultural land up until the 1970s when commercial development began to the north and continued through 1988, when the surrounding area was observed in its current configuration. Two gas stations are located at 275 feet and 435 feet north/northwest of the LOD, respectively. The Exxon gas station that is located approximately 275 feet north (upgradient) of the LOD has a history of environmental issues. Based on information provided by MDE, a 1,000-gallon used oil UST, a 1,000-gallon heating oil UST and three hydraulic lifts were excavated / removed from the facility in 1996. Approximately 539 tons of impacted soil was excavated and removed from the site, most coming from around the hydraulic lifts and used oil UST. Soil samples identified isolated impacts around the former hydraulic lifts. MDE requested that three monitoring wells be advanced at the site and analyzed for petroleum constituents. Based on the results of the investigation, groundwater impacts were detected primarily in the southern portion of the site, as well as lower detections in the northwestern portion of the site. Based on a groundwater elevation survey, the hydraulic gradient is to the southwest (towards the LOD). The case received closure from MDE in 1998. The gas station 350 feet to the northwest is believed to be crossgradient of the of the LOD. Based on the upgradient location of the Exxon gas station, approximately 275 feet to the north of the LOD, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Indian Head Highway (MD 210), immediately south of Old Fort Road, in Fort Washington, Maryland. The surrounding area is semi-rural with some commercial and residential development which began in the early 1980s and continued through 2005, when the surrounding area was observed in its current configuration. An OCP case and a SPILLS case were identified in the surrounding area. The SPILLS case, located approximately 55 feet to the east of the LOD, involved the release of 30 gallons of diesel, some of which entered a storm drain. Clean-up efforts included a vac truck and pressure washing. The storm drain was flushed and sand was put down to absorb and residual diesel. Based on information summarized above, it is believed that majority of the diesel released was remediated. The OCP case, located 580 feet from the LOD, was opened and closed within the same day. Based on distance and status, impacts to LOD from these incidents are unlikely.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Along Branch Avenue, south of Allentown Road	
City	Clinton	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along western side of Branch Avenue (MD 5), between Branch Avenue and Old Branch Avenue at Coolidge Drive, in Clinton, Maryland. The surrounding area includes Andrew's Air Force base to the east, commercial properties and forested land to the west, as well as additional commercial development to the north and south. Based on a review of historical imagery, the surrounding area was unimproved forested areas in the 1930s with some rural residential properties. Andrews Air Force Base (AFB) was constructed to the south in 1942, with commercial development and expansion of Andrews AFB continuing through 2011, when the surrounding area was observed in its current configuration. There are two sites approximately 120 feet and 180 feet west (downgradient) and southwest (crossgradient) of the LOD, respectively, with former USTs and OCP cases associated with them. However, impacts from these two sites are unlikely, based on a review of information provided by MDE through a PID request and their downgradient proximity to the LOD. The LOD is approximately 75 feet west of the Andrews AFB, which was added to the CERCLA National Priorities List in 1999. There are currently 35 Environmental Restoration Program (ERP) sites located in within Andrews AFB. Cleanup efforts include many individual sites both on and off base. Based on a review of available documents on Andrew AFB's environmental website, there is no known impacted soil and/or groundwater in the vicinity of the LOD. Thus, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Hass Instruments 6711 Branch Avenue Clinton, MD	120	OCP – In 1989, an OCP case was opened. It is unknown whether a release occurred. The case was closed a year later. Based on local topography the site appears located downgradient from the LOD.	Low
2	American Boat Center 6709 Old Branch Avenue Camp Springs, MD	180	<p>RCRA SQG , RCRA NON GEN – There are no violation records associated with this facility.</p> <p>UST – The site previously operated three USTs, ranging in size from 550 to 1,000 gallons. The tanks held either heating oil or gasoline. All tanks have been removed from the ground.</p> <p>OCP – In 1994, a 550-gallon UST was closed in-place and two 1,000-gallon USTs were excavated and removed from the site, along with approximately 20 tons of impacted soil.</p> <p>2014 - The facility was cited for violations related to storage of petroleum and waste petroleum products after an anonymous caller reported oil drums were leaking into a nearby stream and used oil filters were sitting on drums. The facility was not found to have released petroleum into the stream; however, they did have to cleanup up the facility and store their petroleum products correctly. The case was closed shortly after these action items were addressed. A groundwater well was installed and checked for odor and/or free product, none of which was found. Thus, the case was closed.</p> <p>Based on historical imagery, the former USTs are believed to be at least 180 feet west (downgradient) of the LOD.</p>	Low
1516	ANDREWS AIR FORCE BASE/ ALLENTOWN ROAD	75	NPL, PFAS NPL, SEMS – The site had been on the National Priorities list since 1999. There are currently 35 Environmental Restoration Program (ERP) sites located in the vicinity of Andrews AFB. Cleanup efforts include many individual sites both on and off base. Each site has been issued a name and corresponding ID number to facilitate tracking progress. Based on a review of available data on Joint Base Andrew's environmental website none of the site are believed to have impacted the LOD.	Low

Ranking Rationale Site Summary		
<p>The LOD is located in the ROW between Indian Head Highway (MD 210) and Old Palmer Road, north of Old Fort Road, in Fort Washington, Maryland. The northern end of the LOD extends west, across Indian Head Highway. The surrounding area is primarily commercial developments with some residential properties. Commercial development began prior to 1981 and is in its current configuration by 2009. There are several records of concern in the surrounding area which include five OCP cases, three SPILLS case, and three RCRA generators. The closest OCP case, located 390 feet from the LOD, involved a report of dumping, but no release was noted and the case was closed. A facility located 425 feet from the LOD had three OCP cases related to tank retrofit/repair, tank closure and new tank installation, as well as two SPILLS incidents associated with a small surface release and failed tank test, respectively. The remaining OCP and SPILL cases were beyond 500 feet from the LOD. Finally, none of the RCRA generators had any violations. Based on distances, hydraulic direction and statuses of these incidents, none are anticipated to have an impact on the LOD.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	North side of Woodyard Road, between Denton Drive and Keppel Place	
City	Clinton	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the northern side of Woodyard Road (MD 223), between Denton Drive and Keppel Place, in Clinton, Maryland. The western end of the LOD extends south, across Woodyard Road. The surrounding area is comprised of commercial and residential properties with forested areas. Tanglewood Community Park is located north of to the LOD, a Verizon Store to the east, and commercial stores and a shopping center to the southwest. The area was primarily agricultural and forested area in 1949. Residential development began by 1963 while commercial development began in the 1970s. The surrounding area was observed to be developed in its current configuration in 2005. The Verizon Communications property, located approximately 25 feet east-northeast of the LOD, was listed as having one active 4,000-diesely UST and one former 2,000-gallon kerosene UST. The 2,000-gallon kerosene UST, which was excavated and removed from the site in 1992, was observed to be in good condition; however, impacted soil was encountered as PID readings were recorded as 1,000 ppm in the excavation. A total of 68 tons of petroleum-impacted soil was disposed of offsite, the excavation backfilled and the case was closed in September 1993. In 1994, the 4,000-gallon diesel UST was installed in approximately the same location as the prior 2,000-gallon UST. Based on the proximity of the soil impacts identified during removal of the 2,000-gallon UST, impacts to the LOD cannot be completely ruled out. Thus, further investigation is warranted to determine if any subsurface impacts are present within the boundary of the LOD.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Center median of Indian Head Highway, north of Fort Washington Road	
City	Fort Washington	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located primarily along the central median of Indian Head Highway (MD 210), north of Fort Washington Road, in Fort Washington, Maryland. The northern end of the LOD extends east, across the northbound lanes of Indian Head Highway. This surrounding area is primarily forested land with commercial properties to the southwest and a large residential complex to the southeast. Prior to development of the commercial properties, in the late 1960s/early 1970s, it was used for agricultural purposes. The commercial property to the southwest, the Tantallon Center, a shopping mall, was listed on the UST and OCP databases for the removal of two 5,000-gallon heating oil USTs. However, based on information provided by MDE, no impacted media was encountered during removal of these USTs. A dry cleaner was noted 410 feet from the LOD; however, no violations were reported for this facility. Based on this information, impacts to the LOD from these facilities are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is primarily located along the central median of Branch Avenue (MD 5), north of Surratts Road, in Clinton, Maryland. The northeast portion of the LOD extends to the eastern side of Branch Avenue. The surrounding area is mixed-use commercial/residential. Residential subdivisions intermixed with forested area are located north, southwest and west of the LOD. Commercial complexes are situated to the southeast, across Surratts Road. The area was primarily agricultural land and forested areas in 1949. Commercial development began in the southeast by 1981, and residential subdivisions were under construction north and west of the LOD by 1998. The surrounding area was observed to be developed in its current configuration in 2005. One record of concern in the vicinity of the LOD was identified, an OCP case located 366 feet from the LOD, which appears to be a roadside spill that occurred on in 1987. The release was addressed and the case closed. Based on the distance and hydraulic direction (downgradient), this incident is unlikely to have an impact on the LOD.</p>

Ranking Rationale Site Summary		
<p>The LOD is primarily located along the central median of Branch Avenue (MD 5), north of and crossing the intersection with Surratts Road, in Clinton, Maryland. Portions of the LOD extend east, across Branch Avenue. The surrounding area is mixed-use commercial and residential. Residential subdivisions intermixed with forested area are located north, west and southwest of the LOD. Commercial business complexes are situated southeast of the LOD. The area was primarily agricultural land and forested areas in 1949. Commercial development began in the southeast by 1981, and residential development were under construction north and west of the LOD by 1998. The surrounding area was observed to be developed in its current configuration in 2005. One record of concern in the vicinity of the LOD was identified, an ERIS incident located 31 feet from the LOD, which appears to be a roadside spill that occurred on in 1987. The release was addressed and the case closed. Based on the incident type and date, this incident is unlikely to have an impact on the LOD. A hospital is located approximately 625 feet to the southeast of the LOD. The site has 6 former USTs and three active USTs on-site. Two OCP cases have been opened at the facility due to surficial releases and impacted subsurface material encountered during the removal of a UST. Both cases have received closure from MDE. Based on the local topography, the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely based on the distance of the site.</p>

Ranking Rationale Site Summary		
<p>The LOD is in the central median along Indian Head Highway (MD 210), north of Old Fort Road, in Fort Washington, Maryland. The surrounding area is primarily commercial developments with some residential properties. Commercial development is observed to begin prior to 1981, and is in its current configuration by 1998. There are several records of concern in the surrounding area which include five OCP cases, two SPILLS case, a UST site, and three RCRA generators. The closest OCP case, located 340 feet from the LOD, involved a report of dumping, but no release was noted and the case was closed. A SPILLS incident, located 355 feet from the LOD, involved the surface release of 30 gallons of diesel fuel which was cleaned up using sorbent dust. The remaining UST, OCP and SPILL cases were beyond 500 feet from the LOD. Finally, none of the RCRA generators had any violations. Based on distances, hydraulic direction and statuses of these incidents, none are anticipated to have an impact on the LOD.</p>

Street Address/Nearest Cross Streets	West side of the Branch Avenue off-ramp to Woodyard Road	
City	Clinton	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of the Branch Avenue (MD 5) off-ramp to Woodyard Road, in Clinton, Maryland. The primary area of the LOD is situated in a grass area within the ROW in front of the Woodyard Crossing Shopping Center. The surrounding area is commercial, residential and forested areas. The Woodyard Crossing Shopping Center is located adjacent to the west, and the Landing Shopping Mall is situated east, across Branch Avenue. The area was primarily agricultural land and forested areas with some residential development starting south of Woodyard Road in 1949. Commercial and residential development occurred from 1981 to 2005, which the surrounding area was observed in its current configuration. Seven sites were identified in the environmental database report around the LOD. Only three sites, a commercial facility, gas station, and transformer release involved a documented release to the environment; however, these sites are between 415 and 450 feet south (downgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
8	Shell Gas Station #465/Pepco, 8906 Woodyard Road, Clinton, MD 20735 (cont.)	450	<p>2014 – An OCP case was opened for the removal of three 10,000-gallon gasoline USTs in August 2014. Impacted soil was encountered and approximately 30 tons of petroleum impacted soil was excavated and disposed of offsite. Fifteen confirmation soil samples were collected from the site and analyzed for petroleum constituents and VOCs, which were either non-detect or well below MDE’s non-residential cleanup standards. One 15,000-gasoline UST, one 12,000-gasoline UST, and one 12,000-gallon diesel UST were installed in-place of the former USTs shortly thereafter and the case was closed in September 2014.</p> <p>OCP/ SPILLS - The Spills database documents a release that occurred during a gasoline transfer (Data ID: 72513) in 2018. A car drove over the fuel delivery hose causing the release of 700 gallons of gasoline to the concrete pad. The Fire Department cleaned up the incident and stopped the fuel from entering the storm drain. The remaining fuel was removed with absorbents and a vacuum truck. The case is still open; however, it is believed that all remediation efforts have been completed and the case is awaiting a regulatory review.</p> <p>Based on the local topography the site appears downgradient of the LOD.</p>	Low

Street Address/Nearest Cross Streets	West side of Indian Head Highway, at Cornett Street	
City	Fort Washington	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Indian Head Highway (MD 210), at Cornett Street, in Fort Washington, Maryland. The surrounding area is a mixed-use residential / commercial, with commercial properties primarily to the west and residential properties primarily to the east. The area was originally developed as agricultural land up until the 1980s, when development to the east and west began. The surrounding area was observed to be developed in its current configuration by 2005. A car dealership located west of the LOD had six former petroleum USTs ranging size from 250 gallons to 2,000 gallons. These USTs were installed in the late 1970s and removed in the early to mid-1990s. During removal of the 2,000-gallon gasoline UST petroleum odors were observed in the soils from the bottom of the excavation. The onsite MDE inspector requested that the area be over-excavated and soils tilled for several months, until PID readings from the staged soil were around 5 to 30 ppm. The excavation was then backfilled using the tilled soils and the case was closed. No information was available if four USTs of the former USTs had releases or not. The electric company located approximately 265 feet southwest of the LOD had a three USTs (two of unknown capacity containing gasoline and one 4,000-gallon gasoline) registered to the site that were excavated and removed from the site in July 1994. An OCP case was open and closed in July 1994. The UST were located at least 300 feet from the LOD. Both sites described above are anticipated to be hydraulically downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Jack Windegardner Chevrolet/ 11001 Indian Head Highway, Fort Washington MD	220	UST, OCP – Six USTs (One 2,000-gallon gasoline, one 1,000-gallon used oil, one 500-gallon Gasoline, one 500-gallon used oil, one 250-gallon gasoline, and one 500-gallon kerosene) installed between 1978 and 1979 were excavated and removed from the ground between October 1990 and October 1994. According to available data provided by MDE through a PIA request. A 2,000-gallon gasoline UST and a 1,000-gallon waste oil UST were excavated and removed from the western side of the onsite structure, (approximately 420 feet from the LOD in 1994. Both tanks were inspected after being removed from the ground and found to be in good condition. No impacted material was identified around the former used oil UST; however, petroleum odors were observed in the soils from the bottom of the gasoline UST excavation. The MDE inspector onsite requested that the area be over-excavated to a depth 3 feet below the grade of the former UST. The soils were spread out on poly, mixed with 10-10-10 fertilizer and tilled weekly for several months, until PID readings from the staged soil were around 5 to 30 ppm. The MDE inspector then advised the owner to backfill the excavation and the case was closed. No information on the four other USTs was identified; however, the USTs were most likely on the western half of the site, near the auto repair portion of the car dealership (approximately 220 feet west of the LOD). Based on the local topography the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.	Low
2	Dotson Electric Company, 11101 Indian Head Highway, Fort Washington MD	265	UST, OCP – Three USTs (two of unknown capacity containing gasoline and one 4,000-gallon gasoline) were excavated and removed from the site in July 1994. An OCP case was open and closed in July 1994 and closed the same day. The UST were most likely located at least 300 feet downgradient of the LOD. Thus, Impacts to the LOD are unlikely.	Low

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1963	The surrounding area is observed to be primarily vacant and agricultural land. Indian Head Highway is observed to the east.	Aerial
1981	The car dealership is observed to the southwest of the LOD. Previously cleared lands to the east and west are observed to be forested now.	Aerial

Street Address/Nearest Cross Streets	Indian Head Highway, west of Christopher Court	
City	Fort Washington	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Indian Head Highway (MD 210), west of Christopher Court, in Fort Washington, Maryland. Forested land is observed to the north and east, and commercial properties, followed by residential properties to the west. The surrounding area was primarily developed as agricultural land up until the 1960s, when development to the west began. The surrounding area was observed in its current configuration in the early 2000s. A US Post Office facility located to the west had a 6,000-gallon heating oil UST closed in-place in 1994, a 5,000-gallon gasoline UST excavated and removed in 1996, and a previously closed-in place 5,000-gallon UST excavated and removed in 1999. Based on available information provided by MDE through a FOIA request, observations during the USTs closures, as well as analytical sampling data indicate that the former USTs did not impact soil and groundwater in the surrounding area. Further, the former USTs are believed to be at least 200 feet southwest (downgradient) of the LOD. Thus, impacts to the LOD are unlikely.</p>

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Indian Head Highway (MD 210), north of Swan Creek Road East, in Fort Washington, Maryland. Commercial properties with residential developments beyond are located to the north, west and south, while forested land and residential development are to the east. The surrounding area was primarily developed as agricultural land up until the 1960s, when development to the west began. The surrounding area was observed to developed in its current configuration in the early 2000s. Multiple records of concern were identified, all located either cross- or downgradient of the LOD. A US Post office located 460 feet north the LOD had four former petroleum UST removed from the site between 1994 and 1999; a gas station located 330 feet to the south had two 12,000-gallon USTs installed in 1997; and a hospital located 375 feet to the southwest had a 550-gallon diesel UST removed in 1998 but continues to have a 500-gallon diesel UST in operation. None of these UST sites have been found to have been impacted by their current or former USTs. A lumber company located 250 feet to the west had two USTs excavated and removed in October 1991. An OCP case was opened in October 1991 and was closed 3 years later in June 1994. Information provided in the database report did not state whether a release had occurred or not and a request to MDE for additional information determined their files had been deleted. Regardless, as the former USTs are located hydraulically downgradient of the LOD, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Mobile Station 11800 Livingston Road	330	<p>UST, OCP – Two active 12,000-gallon gasohol USTs were installed in 1997. There are several OCP cases related to this site. In 1997, an OCP case was opened for the installation of the two 12,000-gallon gasohol USTs at the site. In 2003, an OCP case was opened due to several violations identified during a compliance inspection; however, no releases to soil and/or groundwater were identified during the inspections. The violations were corrected and the case was closed. In 2012, a vent pipe associated with the onsite USTs was damaged during earthwork. No release to soil or groundwater occurred. The vent pipe was repaired and the case was closed.</p> <p>SPILLS – Three spill reports associated with the facility were submitted to MDE due to deficiencies in the two UST's ancillary equipment; however, there is no indication that these incidents resulted in a release to soil and/or groundwater at the site.</p> <p>Based on the Potomac River and associated creeks to the west, this site is anticipated to be located hydraulically crossgradient of the LOD.</p>	Low
2	Ford Lumber Company/ 11616 Livingston Road	250	<p>UST, OCP – Two USTs (a 1,000-gallon gasoline and a 1,000-gallon heating oil) were excavated and removed in October 1991 after having been installed in January 1961. An OCP case was opened in October 1991 and was closed 3 years later in June 1994. Information provided in the environmental database report did not state whether a release or cleanup had occurred or not. Further information was requested from MDE via PIA request; however, according to a response from MDE, the case file has been deleted; therefore, it cannot be said for certain that the previous USTs did or did not impact the LOD. Based on historical imagery, the USTs were likely at least 250 feet west of the LOD. Further, based on the Potomac River and associated creeks to the west, this site is anticipated to be located hydraulically downgradient of the LOD.</p>	Low
3,5,6	Fort Washington Hospital / Shah Pathology 11711 -11710 Livingston Road	375	<p>UST, OCP – A 500-gallon diesel USTs is currently in-use at this facility. In addition, a former 550-gallon diesel UST was excavated and removed in November 1998. An OCP in relation to the former UST was opened in September 1998 and was closed ten months later, in July 1999. Based on the Potomac River and associated creeks to the west, this site is anticipated to be located hydraulically downgradient of the LOD.</p> <p>FINDS, RCRA LQG – Minor air permit and RCRA-LQG, no violations.</p>	Low

Project Area Site Descriptions

4	Fort Washington Post Office/ 11550 Livingston Road	460	<p>UST, OCP – In 1994, a 6,000-gallon heating oil UST was closed in-place due to location near a pad-mounted transformer off the east side of the facility. Three soil samples were collected approximately 10 feet below grade from the northern, eastern, and southern sides of the UST and analyzed for naphthalene and TPH, all of which were non-detect.</p> <p>In 1995, a 6,000-gallon gasoline UST located approximately 100 feet northeast of the facility was excavated and removed from the site. A confirmation soil sample from the bottom of the excavation, as well as a composite sample from the excavated soils were collected and analyzed for TPH and BTEX, all of which were non-detect. Following removal, a 10,000-gallon gasoline UST was installed in its place.</p> <p>In 1999, a 5,000-gallon heating oil UST that had been previously closed in-place (date unknown) was excavated and removed from the central portion of the site, north of the facility. Five soil samples were collected from the walls and bottom of the excavation and analyzed for BTEX, naphthalene, and TPH, which were all non-detect with the exception of two detected concentrations of TPH of 4.8 mg/kg (east wall) and 41 mg/kg (central excavation bottom), which are below both MDE's residential and industrial cleanup action levels for TPH. Based on the information summarized above, MDE granted closure to the UST case.</p> <p>Note: MDE's UST database states the 10,000-gallon gasoline UST installed in 1995 was removed in February 1998; however, information on that removal was not provided.</p> <p>Based on the Potomac River and associated creeks to the west, this site is anticipated to be located downgradient of the LOD.</p>	Low

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western ROW of Indian Head Highway (MD 210), south of East Swan Creek Road, in Fort Washington, Maryland. A shopping center is located directly north of the LOD, and vacant land to the east with residential properties located further east. The surrounding area was primarily vacant forested land up until the 1980s, when commercial development to the north began in the 1980s. By 2005, the surrounding area was observed to be developed in its current configuration. A former drycleaner was located in the shopping center approximately 550 feet to the north of the LOD. The dry cleaner facility was active from 1983 until 2005. Phase I ESAs were conducted on the property in March 2000, March 2003, and March 2004. These reports identified the dry cleaning facility as a potential source of contamination to the soil and groundwater beneath the site. A Phase II ESA conducted in April 2000 confirmed the dry cleaning operations as the source of chlorinated solvents in the immediate vicinity of the dry cleaning facility. On February 8, 2001, the property was issued a No Further Requirements Determination (NFRD) allowing the property to be used for commercial or industrial purposes, and imposed groundwater use restrictions. Based on the distance of the site from the LOD and inferred groundwater flow to the west, crossgradient of the LOD, impacts to the LOD are unlikely. Two other environmental records of concern were identified, both for the generation of hazardous waste; however, neither have any documented violations and both are 400+ feet crossgradient from the LOD.</p>

Watershed:	WAS	
Street Address/Nearest Cross Streets	West side of Indian Head Highway, south of Old Fort Road	
City	Fort Washington	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD lies along the west side of Indian Head Highway (MD 210), south of Old Fort Road, in Fort Washington, Maryland. The surrounding area was primarily forested and agricultural land up until the 1980s when a commercial development started to the northeast. The surrounding area was observed in its current configuration in 2005. Two facilities of concern were identified, both located in the commercial property northeast of the LOD. The first facility, an Exxon gas station located 384 feet from the LOD, is listed on the UST, OCP and SPILLS database and has a history of environmental issues. Subsurface petroleum impacts were first identified in May 1989 during a site assessment resulting in five USTs being removed in October 1989. Four of the USTs removed had perforations. In October 1991, a pump and treat/soil vapor extraction system was installed. This system was then expanded in June 1992 through the installation of new system wells. In May 2001, the remediation system was further expanded to include air sparging. In November 2001, during removal of the three 12,000-gallon gasoline USTs, 784.24 tons of petroleum-impacted soils were excavated. The remediation system operated until February 2003. Later in 2003, the offsite groundwater impacts were delineated and three applications of chemical oxidants were injected to remediate the offsite groundwater impacts. In July 2010, MDE closed the OCP case but noted that residual impacts remain. The second facility, an active drycleaner, is located 734 feet from the LOD. No records of any release were noted and the violations recorded were associated with administrative errors. Based on the groundwater flow direction information contained in the Exxon gas station reports, groundwater flow is to the east-northeast, which is away from the LOD. Based on this, impacts to the LOD from these facilities are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
5191	Super Dry Cleaners 12770 Olde Fort Road Fort Washington MD 20744	734	FINDS/FRS – An active drycleaner located northeast of the LOD. The facility has an active air permit. Several notices of violation have been issued to the facility, however these appear to be administrative errors. Based on information obtained for the adjacent Exxon gas station (see ERIS Site ID #5200 below), this site is downgradient of the LOD.	Low
5200	Exxon #5687 12800 Old Fort Road Fort Washington MD 20781	384	<p>UST – An active gas station has three active USTs and nine former USTs. Nine former USTs have previously been excavated and removed from the site. In 1997, a 1,000-gallon used oil UST was removed; in 1989, a 4,000-, 6,000- and 8,000-gallon gasoline USTs were removed along with a 1,000-gallon heating oil UST and a 1,000-gallon used oil UST; and in 2001, three 12,000-gallon gasoline USTs were removed. In 2017, a 20,000-gal diesel UST and two 20,000-gal gasohol USTs were installed.</p> <p>OCP – In May 1989, petroleum impacts were identified during a site assessment. As a result, five USTs were removed in October 1989. Perforations were observed in the gasoline USTs and the used oil UST. In October 1991, a pump and treat/soil vapor extraction system was installed. In June 1992, additional remediation wells were installed and connected to the remediation system. In May 2001, the remediation system was expanded to include air sparging. In November 2001, during removal of the three gasoline USTs, 784.24 tons of petroleum-impacted soils were excavated. The remediation system operated until February 2003. Later in 2003, the offsite groundwater impacts were delineated and three applications of chemical oxidants injected to reduce those impacts. In July 2010, MDE closed the OCP case but noted that residual impacts remain.</p> <p>SPILLS - A spill of approximately 10 gallons of diesel fuel occurred when a delivery truck backed into a pole, breaking the valve on the delivery reel and releasing product onto the asphalt. The spill was cleaned up.</p> <p>Based on reports obtained from MDE, the groundwater flow is to the east-northeast, which is away from the LOD.</p>	Low

County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Indian Head Highway (MD 210), south of Cornett Street, in Fort Washington, Maryland. The surrounding area is mixed-use residential/commercial, with commercial properties primarily to the west and residential properties primarily to the east. The area was agricultural land up until the 1980s, when development to the east and west began. The surrounding area was observed in its current configuration by 2005. Two facilities listed on one or more environmental database was identified. A car dealership located west of the LOD had six former petroleum USTs ranging size from 250 gallons to 2,000 gallons. These USTs were installed in the late 1970s and removed in the early to mid-1990s. During removal of the 2,000-gallon gasoline UST petroleum odors were observed in the soils from the bottom of the excavation. The onsite MDE inspector requested that the area be over-excavated and soils tilled for several months, until PID readings from the staged soil were around 5 to 30 ppm. The excavation was then backfilled using the tilled soils and the case was closed. No information was available if four USTs of the former USTs had releases or not. An electric company located approximately 265 feet southwest of the LOD had a three USTs (two of unknown capacity containing gasoline and one 4,000-gallon gasoline) registered to the site that were excavated and removed from the site in July 1994. An OCP case was open and closed in July 1994. The USTs were located at least 300 feet from the LOD. Both sites described above are anticipated to be hydraulically downgradient of the LOD. Thus, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk
1	Winegardner Chevrolet / 11001 Indian Head Highway	220	UST, OCP – Six USTs (One 2,000-gallon gasoline, one 1,000-gallon used oil, one 500-gallon Gasoline, one 500-gallon used oil, one 250-gallon gasoline, and one 500-gallon kerosene) installed between 1978 and 1979 were excavated and removed from the ground between October 1990 and October 1994. According to available data provided by MDE through a PIA request. A 2,000-gallon gasoline UST and a 1,000-gallon waste oil UST were excavated and removed from the western side of the onsite structure, (approximately 420 feet from the LOD in 1994. Both tanks were inspected after being removed from the ground and found to be in good condition. No impacted material was identified around the former used oil UST; however, petroleum odors were observed in the soils from the bottom of the gasoline UST excavation. The MDE inspector onsite requested that the area be over-excavated to a depth 3 feet below the grade of the former UST. The soils were spread out on poly, mixed with 10-10-10 fertilizer and tilled weekly for several months, until PID readings from the staged soil were around 5 to 30 ppm. The MDE inspector then advised the owner to backfill the excavation and the case was closed . No information on the four other USTs was identified; however, the USTs were most likely on the western half of the site, near the auto repair portion of the car dealership (approximately 220 feet west of the LOD). Based on the local topography the site is believed to be downgradient of the LOD. Thus, impacts to the LOD are unlikely.	Low
2	Dotson Electric Company/ 11101 Indian Head Highway	300	UST, OCP – Three USTs (two of unknown capacity containing gasoline and one 4,000-gallon gasoline) were excavated and removed from the site in July 1994. An OCP case was open and closed in July 1994 and closed the same day. The UST were most likely located at least 300 feet downgradient of the LOD. Thus, Impacts to the LOD are unlikely.	Low

Ranking Rationale Site Summary		
<p>The LOD is located along the southeast side of Indian Head Highway (MD 210), northeast of Farmington Road East, in Accokeek, Maryland. A commercial property abuts the LOD to the east, while the remaining surrounding area is mainly forested with additional commercial structures present to the west, and residential properties to the east. Two records of concern were identified, both associated with the Piscataway Wastewater Treatment Plant; however, upon further evaluation it was determined this facility is actually located over 1,000 feet to the northeast. A release of approximately 738,000 gallons of treated water occurred in 2015, due to a breaker short circuiting. The treated water flowed into a pond area that was part of a holding tank project.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the northern side of Farmington Road West, west of Indian Head Highway (MD 210), in Accokeek, Maryland. Residential properties are observed to the south and east, and the Piscataway Wastewater Treatment Plant is located to the north and northwest. The surrounding area was primarily cleared agricultural land until the late 1960s when the wastewater treatment plant located to the north was constructed. The LOD and surrounding area was observed to be developed in its current configuration by the late 2000's. One facility of concern was identified, the Piscataway Wastewater Treatment Plant, which was listed on the SPILLS, ERNS, OCP, RCRA SQG, and CERCLIS databases. Fourteen USTs were previously removed. Thirteen OCPs have been opened; four for tank removals, three for petroleum releases, with the remaining being for unknown reason. The two ERNS cases were associated with minor surface releases. Most SPILLS incidents involved the release of sewage. This plant was inspected by the EPA which determined that it did not qualify for the NPL List. Although this facility is listed on multiple database and has a significant history of incidences, based on topography, this facility is downgradient of the LOD, at a distance of 680+ feet. Based on the distance and hydraulic direction, impacts to the LOD from this facility is unlikely.</p>

County	Charles	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located within a median between Indian Head Highway (MD 210) and Hickory Knoll Lane, north of Livingston Road, in Waldorf, Maryland. The area surrounding the LOD is mainly forested land with some residential properties further to the north, and large commercial structures further to the south. The area was primarily forested land up until the late 1990s when development began. The surrounding area was observed to be developed in its current configuration by 2005. An MDE VCP site is located southwest of the LOD. This site is a vacant 11 acre parcel located approximately 100 feet west of the LOD. In 1999, a UST removal at the Accokeek Gas and Go Service Station, south of the site and approximately 1,000 feet southwest of the LOD, led to the opening of an OCP case. Investigations conducted determined groundwater on the site had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In August 2009, a Phase II environmental site assessment was conducted determined that groundwater beneath the property had been impacted with elevated levels of petroleum compounds. In 2010, the owners of the site entered into the MDE VCP program and in February 2011, MDE issued a no further remediation determination for the site and the case was closed. Information on MDE's website for the site stated that surface water and groundwater on the site flows northwest (crossgradient of the LOD) towards Farmington Creek. Based on available site characterization information, the impacted groundwater is not believed to have affected the LOD.</p>

6486	Accokeek – Vacant Parcels 15909 Hickory Knoll Road	100	LUC, SHWS, VCP - LUC, SHWS, VCP - This site is a vacant 11 acre parcel located approximately 100 feet west of the LOD. The property consists primarily of undeveloped forested land. In 1999, a UST removal at the Accokeek Gas and Go Service Station, south of the site and approximately 1,000 feet southwest of the LOD, led to the opening of an MDE Oil Control Program (OCP) case (1999-1655PG1). The OCP investigated environmental impacts due to a petroleum release from the USTs and conducted further investigations in 2003 and 2004 that indicated the groundwater on the site had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In December 2008, a Phase I environmental site assessment was conducted at the site. This assessment indicated that the site had one recognized environmental condition which was the former USTs located at an adjacent property. A Phase II environmental site assessment was conducted at the properties in August 2009 and sampling indicated that the property had been impacted by elevated levels of petroleum compounds in groundwater. Additional soil sampling for metals and semi-volatile organic compounds was conducted at the property to assess potential impacts from debris dumping. Soil gas sampling was performed in July 2009 to determine the extent and nature of risks associated with sub-surface vapors from the off-site USTs. In 2010, the owners of the site entered into the MDE VCP program and in February 2011, MDE issued a no further remediation determination for the site and the case was closed. Information on MDE's website for the site stated that surface water and groundwater on the site flows northwest (crossgradient of the LOD) towards Farmington Creek. Based on available information on the site characterization activities performed on the gas station to the south, impacted groundwater is not believed to have affected the LOD.	Low

County	Prince George's
Type of property	ROW
Ranking Rationale Site Summary	
<p>The LOD is located between Indian Head Highway (MD 210) and Hickory Knoll Road, north of Livingston Road, in Accokeek, Maryland. The surrounding area is observed to be commercial properties to the south and east. Forested land to the west and further to the south. The area was primarily forested land up until the late 1990s when commercial development began to the east and west. Development continue through 2005, when the surrounding area was observed in its current configuration. Two gas stations, an MDE VCP site and a drycleaner are located in the immediate vicinity of the LOD. The gas station, located approximately 200 feet southwest of the LOD and potentially upgradient, was found to have impacted soil and groundwater to the north, west, and south of the site in 1999. The vacant Accokeek property, located north of the gas station and approximately 65 feet west of the LOD, entered into the MDE VCP program in 2010 after petroleum impacts were identified through environmental investigations conducted by the landowner in 2009. The OCP case for the gas station received closure in 2009, and the vacant VCP property to the north received a no further action determination in 2011. Files pertaining to the site characterization of the property stated that groundwater is believed to flow to the northwest (crossgradient) of the LOD. Furthermore, there is an active gas station and drycleaner facility located approximately 305 and 200 feet to the east of the LOD, respectively. No additional data was available on releases on these sites; however, these facilities are located upgradient of the LOD. Due to the known soil and groundwater impacts near the LOD, and the potential for other impacts, further investigation is warranted to determine if any subsurface impacts are present within the boundary of the LOD.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Accokeek – Vacant Parcels/ 15909 Hickory Knoll Road	65	<p>LUC, SHWS, VCP - This site is a vacant 11 acre parcel located to the northwest of the LOD. The property consists of undeveloped woodlands and is owned by John R. Jensen Trust and the Estate of Sanford Bomstein. In 1999, an underground storage tank (UST) removal at the Accokeek Gas and Go Service Station (an adjacent property) led to the opening of an MDE Oil Control Program (OCP) case (1999-1655PG1). The OCP investigated environmental impacts due to a petroleum release from the USTs and conducted further investigations in 2003 and 2004 that indicated the groundwater at parcel C of the Accokeek Vacant Parcels property had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In December 2008, a Phase I environmental site assessment was conducted at the Accokeek Vacant Parcels properties. This assessment indicated that the properties had one recognized environmental condition which was the former USTs located at an adjacent property. A Phase II environmental site assessment was conducted at the properties in August 2009 and sampling indicated that the property had been impacted by elevated levels of petroleum compounds in groundwater. Additional soil sampling for metals and semi-volatile organic compounds was conducted at the property to assess potential impacts from debris dumping. Soil gas sampling was performed in July 2009 to determine the extent and nature of risks associated with sub-surface vapors from the off-site USTs.</p> <p>On May 25, 2010, the John R. Jensen Trust and the Estate of Sanford Bomstein submitted applications to the Voluntary Cleanup Program (VCP) as inculpable persons seeking No Further Requirements Determinations (NFRDs) for Tier 1A (Residential Unrestricted) future use of the property. On February 11, 2011 the VCP issued NFRDs to the applicants and on March 4, 2011 they were recorded in the land records of Prince George's County.</p> <p>Information on MDE's website for the site stated that surface water from the property flows northwest to Farmington Creek. Shallow groundwater at the property also is reportedly indicated to flow to the northwest. Based</p>	Low

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
5	Accokeek Gas & Go 201 Bryan Point Road (cont.)	250	<p>was abandoned in place somewhere on the site. The case was closed approximately 3 months later.</p> <p>1999 – A subsurface investigation was conducted on the property by advancing 3 soil borings and collecting samples from approximately 14 ft below grade that identified concentrations of BTEX (16.3 ug/kg to 311,840 ug/kg) and TPH-GRO (<10 mg/kg to 650 mg/kg). Ten additional soil borings were advanced to 12 feet and identified concentrations of BTEX (<5 ug/kg to 361 ug/kg) and TPH-GRO (<10 ug/kg). Subsequently four 8,000-gallon gasoline USTs along with 683 tons of impacted soil. Two groundwater monitoring wells were installed on the facility. Depth to groundwater was approximately 13 to 14.5 feet below grade. Detected concentrations of BTEX (22,400 and 33,000 ug/l), MTBE 320 ug/l and 2,200 ug/l), TPH-GRO 75 mg/l and 99 mg/l), and TPH-DRO (24 mg/l and 46 mg/l) were recorded in the groundwater samples. Six additional soil borings and groundwater samples were collected in 2003 that indicated more widespread petroleum impacts in the area. In 2004, three additional soil samples and groundwater samples were collected from borings advanced on the property to the northwest of the site. BTEX concentrations up to 83,862 ug/l, MTBE at 64,004 ug/l, and TPH-GRO ranging up to 273 mg/l, and TPH-DRO ranging up to 1.6 mg/l. The contractor proposed additional borings on properties to the north, south, west, and northeast. Additionally, the property to the north entered into the MDE VCP program to determine and mitigate the impacts present on-site. The OCP case received closure in 2009. Files pertaining to the site characterization of the property stated that groundwater is believed to flow to the southwest (downgradient) of the LOD; however, available information from the summary of the VCP site to the north stated that groundwater was believed to flow to the northwest. Based on a lack of information on the full characterization of the impacted soil and groundwater in the vicinity of the LOD, further investigation may be warranted to determine if any subsurface impacts are present within the boundary of the LOD.</p> <p>2005 – Approximately 20 to 25-gallons of gasoline was spilled during the overfilling of a UST. It was found that the station had no outdoor alarm and that employees tried to clean up the release by spraying a garden hose to disperse the gasoline. Subsequently, the material was contained and removed from the site and the gas station was issued a notice of violation, along with a fine for the incident.</p>	Moderate

Street Address/Nearest Cross Streets	Central median of Crain Highway, north of Blackstone Ave/Old Indian Head Road	
City	Cheltenham	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Crain Highway (US Route 301), north of Blackstone Ave/Old Indian Head Road, in Cheltenham, Maryland. The surrounding area is primarily residential properties and forested land. The surrounding area was primarily rural agricultural land up until the 1980s, when residential development began to occur to the west. The surrounding area was observed in its current configuration around 1993. One record of concern was listed, a facility located approximately 305 feet to the southeast (hydraulically downgradient) had two USTs that are reported to be closed. Based on distance and hydraulic direction, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Crain Highway (US Route 301), north of Oak Barrel Court, in Upper Marlboro, Maryland. A warehouse is located to the northwest, a solar plant and fairground/park to the east, forested land and an overhead power transmission line easement to the east and west, and forest land with residential properties beyond to the south. The surrounding area was primarily agricultural land up until the 1970s, when commercial development began to occur to the north. No records of concern that would have an impact on the LOD were identified during this environmental review.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Crain Highway (US Route 301), south of Oak Barrel Court, in Brandywine, Maryland. The surrounding area is relatively rural. Forest land is observed to the north and west; residential properties, a motel and additional forested land to the east; and a gravel pit to the southwest along with additional forested land. Residential development continued to the east and south up until approximately 2009, when the surrounding area was observed in its current configuration. The motel has a registered 1,000-gallon heating oil UST located on the southeastern portion of the property, which based on a boiler smokestack observed on the southeastern structure in aerial photograph, is located on the southeastern portion of the property. No releases have been reported in regard to this UST, as well as the site is located hydraulically downgradient of the LOD. A SHWS LRP site, located approximately 585 feet southwest of the LOD, is an old gravel pit with three OCP cases also associated with it. The site is both downgradient and hydraulically disconnected from the LOD; therefore, impacts to the LOD are unlikely.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the western side of Crain Highway (US Route 301), north of an unnamed access road leading to a gravel pit, in Brandywine, Maryland. The surrounding area is relatively rural. Forest land is observed to the north and west; residential properties, a motel and additional forested land to the northeast; and a residential property with additional forested land to the south. Residential development continued to the east and south up until approximately 2009, when the surrounding area was observed in its current configuration. Two records of concern were identified. The first is a SHWS LRP site is located approximately 475 feet southwest of the LOD. The site is an old gravel pit, with three OCP cases also associated with it. Based on local topography, the gravel pit appears hydraulically crossgradient from the LOD; therefore, impacts to the LOD are unlikely. The second record of concern is an AST site located 365 feet from the LOD associated with a company specializing in used oil. The site has two 20,000-gallon used oil ASTs and one 1,000-gallon diesel AST. The ASTs were located in secondary containment systems based on aerial photographs. Additionally, no violations, spills/releases, or OCP cases associated with the facility were identified. Based on this information, impacts to the LOD from the used oil facility is unlikely.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Central median of Branch Avenue, south of Short Cut Road	
City	Brandywine	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Branch Avenue (MD 5), south of Short Cut Road, in Brandywine, Maryland. The surrounding area is composed of commercial properties and forested land. The surrounding area was primarily rural agricultural and forested land up until 1970, when a storage yard to the east and commercial development to the north were observed. Residential development to the northwest began in the 2000s and the area was observed in its current configuration by 2018. The adjacent trailer storage yard, which was previously a junk yard from the 1960s through approximately 1990, had a 4,000-gallon diesel UST and a 6,000-gallon gasoline UST removed in 1990. A request for additional information on these USTs was submitted to MDE, but no files were available. A gas station located 310 feet north currently has four existing USTs, including an 8,000-gallon and 10,000-gallon gasoline USTs, a 10,000-gallon diesel UST and an 8,000-gallon kerosene UST. In addition, five 4,000-gallon USTs, two 1,000-gallon USTs and one 550-gallon UST were excavated and removed in 1997. During removal of the former USTs, impacted soil was identified resulting in the excavation of over 2,480 tons of impacted soil. After the impacted material was removed, the four existing USTs were installed. Based on data provided by MDE, no soil or groundwater sampling data was available. Based on the lack of information relating to former USTs previously present at the adjacent trailer yard and nearby gasoline station, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1	Ransom Motors/ 14504 Crain Highway	140	FINDS/FRS, UST – The facility had a 4,000-gallon diesel UST and 6,000-gallon gasoline UST excavated and removed from the property in 1990. Based on historical imagery, the site was observed to be junk yard at least the early 1960s. A PIA request was submitted to MDE for information on the former USTs, but no files were available.	Moderate
2	Sunoco (former Mobil) Gas Station/ 14330 Crain Highway	310	<p>FINDS/FRS, ICIS – Minor air permit, no violations.</p> <p>UST, OCP – The site has had a total of 12 USTs present on site from 1967 to present day. Eight UST were excavated and removed in 1997. Currently, one 10,000-gallon gasoline UST, one 10,000-gallon diesel UST, one 8,000-gallon compartmentalized UST (6,000-gallons gasoline and 2,000-gallons kerosene) and one 1,000-gallon heating oil UST exist.</p> <p>1986 – Approximately 2.7 gallons was release due to tank failure from an air pocket in one of the lines. MDE requested that that UST be reinstalled and the case was in 1992.</p> <p>1997 – Five 4,000-gallon USTs, two 1,000-gallon USTs, and one 550-gallon UST were excavated and removed from the site. Impacted soil was identified around the former USTs and over 2,480 tons of soil was excavated from around the former USTs. After the impacted material was removed, the four existing USTs summarized above were installed. Based on available data provided by MDE, no soil or groundwater sampling was conducted and/or the data was not provided in the OCP case file.</p> <p>SPILLS - Two spills have also occurred at the facility that releases of 40 and 50-gallons of fuel was released onto the ground in 2015 and 2020, respectively.</p>	Moderate
3	Besche Oil Co/ Ransom Motor Junk Yard/ Rt 301 & Short Cut	520	OCP – Three OCP cases from the 1989 to 2007 are associated with this property. Based on available data, these OCP cases appear to be associated with dumping and surficial spills, as all three were closed in less two months.	Low

County	Prince George's	
Type of property	Residential	
Ranking Rationale Site Summary		
<p>The LOD is along the western side of Piscataway Road (MD 223), between Joseph Drive and Lazy Acres Road, in Clinton, Maryland. The surrounding area is semi-rural/suburban, with residential properties located to the north and west, and forested and cleared lands to the northeast, east, and south. The surrounding area was primarily utilized as agricultural land up until the early 1970s, when residential development began to occur to the north and west. By 1988, the surrounding area was observed in its current configuration. Three records of concern were identified; two OCP cases and one Spills case; however, these incidents are 295 feet or greater from the LOD and are located either hydraulically downgradient or crossgradient. Thus, impacts to the LOD are not expected from these incidents.</p>

Watershed:	WAS	
Street Address/Nearest Cross Streets	Central median of Branch Avenue, south of Moores Road	
City	Brandywine	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Branch Avenue (MD 5), south of Moores Road, in Brandywine, Maryland. A gas station constructed in approximately 2019 is west of the LOD; an open field and residential properties is to the east; forested land is located to the south; and commercial properties and forested land are located to the north. The surrounding area was observed to be primarily forested and agricultural land up until the 1970s, when residential development began to occur to the east. Residential and commercial development continued through the late 2010s, when the surrounding area was observed to be developed in its current configuration. The gas station has had no reported spills/releases since its construction in 2019; therefore, impacts to the LOD from this property are unlikely. A commercial vehicle accident occurred at the intersection of Branch Avenue and Moores Road directly north of the LOD in 2004, which resulted in a release requiring cleanup efforts. A request for additional information was submitted to MDE, who responded stating no files were available. Due to lack of information relating to this record, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.</p>

Ranking Rationale Site Summary		
<p>The LOD is located along the central median of Branch Avenue (MD 5), north of Earnshaw Drive, in Brandywine, Maryland. The surrounding area is observed to be primarily forest land and residential properties, with the exception of a plant nursery to the southwest. The surrounding area was primarily agricultural and forested land up until the 1970s, when residential development began to the east/southeast and continued through the late 1980s. The plant nursery to the southwest was observed to be present by 1988, when the LOD and surrounding area were observed to be developed in their current configuration. An OCP case was opened on 09/24/2004 at a property 350 feet southeast (crossgradient) of the LOD, due to dumping that resulted to a release. The material was addressed and the case was closed approximately 2 months later on 12/9/2005. Based on the local topography, the site appears hydraulically crossgradient of the LOD. A second OCP case was opened 650 feet to the east (crossgradient) in response to a ground seep investigation in 2003. No release was identified and the case was closed the same day. Based on distance any hydraulic direction, impacts to the LOD from the OCP are unlikely.</p>

LOD ID: WAS-0992	Site Rank: Low	Figure Location: 
Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	West side of Piscataway Road, north of Floral Park Road	
City	Clinton	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the west side of Piscataway Road (MD 223), north of Floral Park Road, in Clinton, Maryland. Forested land is observed to the north and east; residential properties to the south; and a cemetery, church and school to the west. The surrounding area has remained primarily unchanged since the 1980s, with the exception of the residential development to the southeast of the LOD that was constructed beginning in 2006. The adjacent church to the west had a 550-gallon heating oil UST excavated and removed in 1992. There are no indications that a release occurred and the case was closed within 2 months. A farm located to the south of the LOD had a 1,000-gallon gasoline UST located approximately 800 feet south of the LOD. In 2002, this UST was excavated and removed. Impacted material was encountered and approximately 34 tons of impacted soil was removed and disposed offsite. After the impacted soil had been removed confirmation sampling and test pitting was conducted to determine the extent any remaining subsurface impacts. Based on the results of the investigation, it was determined that any impacts were isolated to immediate area around the former UST. In 2005, the site was redeveloped as a townhome community and any additional impacted subsurface material was most likely addressed during its construction. Based on the distance of these sites, impacts to the LOD are unlikely.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1,2	St. Mary's Church of Piscataway 13401 Piscataway Road Clinton Md 20735	370	<p>FINDS/FRS, ICIS – Minor air permit, no violations.</p> <p>UST, OCP - This site previously had a 550-gallon heating oil UST that was excavated and removed from the ground in October 1992. No releases were recorded in relation to this UST and the case was closed approximately 2 months later. A second OPC case associated with this site was opened in June 1987 and was closed five months later in October 1987.</p> <p>ERIS reported the site to be 10 feet from the LOD, however it is believed that the former heating oil UST is at least 370 feet west of the LOD. Based on local topography the site appears located crossgradient from the LOD.</p>	Low
3	Villages at Piscataway 2401 Floral Park Drive Clinton MD 20735	800	<p>UST, OCP – The site previously had a 1,000-gallon gasoline UST. This excavated and removed from the ground in July 2002. Elevated PID readings greater than 2,000 ppm were recorded from soil analyzed in the excavation. Therefore, the area was over-excavated and approximately 65 tons of impacted soil was excavated and removed from the site. Confirmation samples were collected from the walls and bottom of the excavation and analyzed for TPH-GRO and BTEX. Based on the analytical results, all were non-detect with the exception of MTBE (56 ug/kg) and TPH-GRO (270 ug/kg) in the soil sample from the central area of the excavation floor, as well as TPH-GRO (1,900 ug/kg) in the sample from the southern wall of the excavation. Additional test pits were excavated to the north and south of the excavation and the soils were checked for petroleum odors. The first pit four feet north exhibited a slight petroleum odor; however, no odor was observed in the second test pit approximately 40 feet further to the north. Based on the information summarized above MDE granted closure to the site, since it appeared that residual impacts were isolated to site. Based on available information, the former UST was at least 800 feet south of the LOD.</p>	Low

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1963	Forested land is observed to the south. Residential properties are observed to the east. A church is observed to the west. Agricultural land is observed to the south and further to the east and west.	Aerial
1988	Additional development is observed on the church campus to the west.	Aerial

Quadrant:	SW
Watershed:	WAS
Street Address/Nearest Cross Streets	Between Indian Head Highway and Jennifer Drive, north of Livingston Road
City	Accokeek
County	Prince George's
Type of property	ROW
Ranking Rationale Site Summary	
<p>The LOD is located between Indian Head Highway (MD 210) and Jennifer Drive, north of Livingston Road, in Accokeek, Maryland. The surrounding area has commercial properties to the south, east, and southwest, and forested land to the west and further to the south. The area was primarily forested land up until the 1980s when commercial development began to the east and southwest. Development continue through 2005, when the surrounding area was observed in its current configuration. Two gas stations, an MDE VCP site and a drycleaner are located in the immediate vicinity of the LOD. In 1999, the gas station to the west was found to have impacted soil and groundwater to the west, northwest and southwest of the LOD. The vacant Accokeek property, located north of the gas station and approximately 65 feet west of the LOD, entered into the MDE VCP program in 2010 after petroleum impacts were identified through environmental investigations conducted by the landowner in 2009. The OCP case for the gas station received closure in 2009, and the vacant VCP property to the north received a no further action determination in 2011. Files pertaining to the site characterization of the property stated that groundwater is believed to flow to the northwest (crossgradient) of the LOD. Based on available data impacts from the gas station to the west are not believed to have impacted the LOD. However, there is an Exxon gas station and a former drycleaner located approximately 70 feet and 120 feet east of LOD, respectively. The gas station currently has two active 15,000-gallon gasohol USTs, and a 12,000-gallon diesel UST (fiberglass) that were installed in 1998. OCP cases for this site include a case that was opened for the installation of the USTs, as well as a case related to dumping. The gas station to the south was also found to have an OCP case relating to dumping where a release was reported and cleanup activities occurred. The drycleaners to the east of the LOD was issued a Notice of Violation; however, no further information was available. Due to the known soil and groundwater impacts near the LOD, and the potential for other impacts, further investigation is warranted to determine if any subsurface impacts are present within the boundary of the LOD.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1, 4	Exxon Gas Station 15797 Livingston Road	70	<p>FINDS/FRS, RCRA SQG – The gas station is an active RCRA-SQG. No violations associated with this facility were identified in the available records.</p> <p>ERNS, SPILLS – Two Spill cases are associated with this site. The first was reported in June 2016, approximately 1-gallon of gasoline was spilled as a customer overfilled their tank. The spill was cleaned up by the facility. The second spill was reported in April 2020 as a customer ran into the pump, damaging it, and causing it to leap approximately half of a gallon of gasoline on the concrete. The pump was shut off and the spill was cleaned up.</p> <p>UST - The site is an active gas station with three currently active USTs, two 15000-gallon Gasohol USTs, and a 12000-gallon Diesel UST (fiberglass) that were installed in 1998. Two OCP cases were reported at this facility related to dumping and the installation of the USTs</p> <p>OCP - Two OCP cases were reported at this facility. The first was opened in October 1998 and was closed seven years later in December 2005. This was in relation to a new tank installation. No release or clean-up was reported. The second OCP case was opened in March 2007 due to “dumping” and closed one month later in April 2007. No further information was provided.</p> <p>Based on local topography the site is potentially upgradient of the LOD. Based on a lack of information, there is a potential for impacts to be present within the LOD.</p>	Moderate
2	Budget Oil 15792 Livingston Road	360	<p>OCP – An OCP was opened and closed in February 1998. No further information was provided. The facility was listed as approximately 270 feet south of the LOD; however, based on further review the site is actually 360 feet southeast (downgradient) of the LOD.</p>	Low

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
3	Accokeek Cleaners 15789 Livingston Road	120	DRYCLEANERS, FED DRYCLEANERS, RCRA CESQG - An active drycleaners is located at this site. A Notice of Violation was issued to this site. ERIS reported the site to be 599 feet to the southeast of the LOD, however the site is approximately 283 feet to the east, potentially upgradient of the LOD. A PIA request was submitted to MDE for additional information on the drycleaner. Unfortunately, MDE stated that no files were available. Due to lack of information relating to these records, further investigation may be warranted prior to intrusive groundwork to determine if environmental media within the LOD have been impacted.	Moderate
5	Accokeek – Vacant Parcels/ 15909 Hickory Knoll Road	190	<p>LUC, SHWS, VCP - This site is a vacant 11 acre parcel located to the northwest of the LOD. The property consists of undeveloped woodlands and is owned by John R. Jensen Trust and the Estate of Sanford Bomstein. In 1999, an underground storage tank (UST) removal at the Accokeek Gas and Go Service Station (an adjacent property) led to the opening of an MDE Oil Control Program (OCP) case (1999-1655PG1). The OCP investigated environmental impacts due to a petroleum release from the USTs and conducted further investigations in 2003 and 2004 that indicated the groundwater at parcel C of the Accokeek Vacant Parcels property had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In December 2008, a Phase I environmental site assessment was conducted at the Accokeek Vacant Parcels properties. This assessment indicated that the properties had one recognized environmental condition which was the former USTs located at an adjacent property. A Phase II environmental site assessment was conducted at the properties in August 2009 and sampling indicated that the property had been impacted by elevated levels of petroleum compounds in groundwater. Additional soil sampling for metals and semi-volatile organic compounds was conducted at the property to assess potential impacts from debris dumping. Soil gas sampling was performed in July 2009 to determine the extent and nature of risks associated with sub-surface vapors from the off-site USTs.</p> <p>On May 25, 2010, the John R. Jensen Trust and the Estate of Sanford Bomstein submitted applications to the Voluntary Cleanup Program (VCP) as inculcable persons seeking No Further Requirements Determinations (NFRDs) for Tier 1A (Residential Unrestricted) future use of the property. On February 11, 2011 the VCP issued NFRDs to the applicants and on March 4, 2011 they were recorded in the land records of Prince George's County.</p>	Low

5	Accokeek – Vacant Parcels/ 15909 Hickory Knoll Road	190	Information on MDE’s website for the site stated that s surface water from the property flows northwest to Farmington Creek. Shallow groundwater at the property also is reportedly indicated to flow to the northwest. Based on available information on the site characterization activities performed on the gas station to the south, impacted groundwater is believed to be primarily 300 feet west (crossgradient) of the LOD.	Low
6	Old National Bank 15808 Livingston Road	605	OCP, UST – A 280-gallon Heating Oil UST was excavated and removed from the ground, and was replaced by a 300-gallon Heating Oil UST (currently active) in 1998. An OCP case was opened in August 1998 and was closed three months later in November 1998.	Low
7	Accokeek Gas & Go 201 Brian Point Road	200	<p>FINDS/FRS, ICIS – Minor air permit.</p> <p>OCP, UST – The site is a gas station that has two active USTs, a 1,000-gallon Gasohol UST, and an 8,000-gallon gasohol UST. In addition, eight USTs were excavated and removed from the ground between 1996 and 1999.</p> <p>1994 – A 1,000-gallon heating oil, 1,000-gallon kerosene, and 1,000-gallon waste oil UST along with 27 tons of impacted soil were excavated and removed from the site in 1994. Additionally, records state a 550-gallon kerosene UST was abandoned in place somewhere on the site. The case was closed approximately 3 months later.</p> <p>1999 – A subsurface investigation was conducted on the property by advancing 3 soil borings and collecting samples from approximately 14 ft below grade that identified concentrations of BTEX (16.3 ug/kg to 311,840 ug/kg) and TPH-GRO (<10 mg/kg to 650 mg/kg). Ten additional soil borings were advanced to 12 feet and identified concentrations of BTEX (<5 ug/kg to 361 ug/kg) and TPH-GRO (<10 ug/kg). Subsequently four 8,000-gallon gasoline USTs along with 683 tons of impacted soil. Two groundwater monitoring wells were installed on the facility. Depth to groundwater was approximately 13 to 14.5 feet below grade. Detected concentrations of BTEX (22,400 and 33,000 ug/l), MTBE 320 ug/l and 2,200 ug/l), TPH-GRO 75 mg/l and 99 mg/l), and TPH-DRO (24 mg/l and 46 mg/l) were recorded in the groundwater samples. Six additional soil borings and groundwater samples were collected in 2003 that indicated more widespread petroleum impacts in the area. In 2004, three additional soil samples and groundwater samples were collected from borings advanced on the property to the northwest of the site. BTEX concentrations up to 83,862 ug/l, MTBE at 64,004 ug/l, and TPH-GRO ranging up to 273 mg/l, and TPH-DRO ranging up to 1.6 mg/l. The contractor proposed additional borings on</p>	Moderate

Ranking Rationale Site Summary		
<p>The LOD lies along the west side of Indian Head Highway (MD 210), between Livingston Road and Fort Washington Road, in Fort Washington, Maryland. The area surrounding the LOD was primarily forested land until the late 1970s when commercial property was developed to the north. Residential properties were developed to the late 1990s. Forested land is still observed on the adjoining property to the west. Two commercial properties located to the north of the LOD were listed on the UST and OCP databases. The first facility, Dotson Electric Company located 316 feet from the LOD, had three USTs removed in 1994. The second facility, Winegardner Chevrolet located 535 feet from the LOD, had six USTs removed between 1990 and 1994. Both of these facilities appear hydraulically crossgradient from the LOD. Based on distances and hydraulic direction, impacts to the LOD from these facilities are unlikely.</p>

Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Southwest portion of Cheltenham Youth Detention Center, north of Surratts Road	
City	Cheltenham	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located within the southwest portion of the Cheltenham Youth Detention Center, north of Surratts Road, in Cheltenham, Maryland. The detention center spans towards the northeast and includes multiple structures on a large open campus. Forested land is observed in all directions, and a cemetery is observed further to the southeast. The detention center was present since at least 1960. The large structure directly north/northwest of the LOD was constructed sometime between the late 1980s and early 1990s. The facility has 26 closed heating oil, diesel, and gasoline USTs ranging in size from 500 to 6,000 gallons. There are twelve OCP cases associated with this facility. A PIA request was submitted to MDE to review the available information; however, only nine of the twelve case reports were provided as the other three had been destroyed per MDE's file retention policy. Based on the available case files, the majority of the USTs previously removed had impacted soil and/or groundwater beneath them. Furthermore, the exact locations of the USTs were not adequately documented and many of the site location figures that were provided in the case files were hand drawn and not to scale. Currently there is a 5,000-gallon petroleum AST located approximately 75 feet north of the LOD, which most likely has taken the place of a former UST that was located in the general vicinity. Due to lack of information relating to these records, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD has been impacted.</p>

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
1, 4903	BOYS VILLAGE - CHELTANHAM ROUTE 301	0	<p>ICIS, FINDS/FRS, - Air permit, no violations.</p> <p>OCP, USTs – The facility has 26 closed heating oil, diesel, and gasoline USTs ranging in size from 500 to 6,000-gallons. The USTs were closed between 1991 and 2014. There are twelve OCP cases associated with this facility, three of which had reported releases and remediation/cleanup. A heating oil UST was most likely installed next to each of the historical buildings onsite; therefore, there is moderate chance that a UST or multiple USTs were previously located within the boundaries of the LOD. Many of the UST closures were not documented or the files have been destroyed per MDE's file retention policy. Currently there is a 5,000-gallon petroleum AST located approximately 75 feet north of the LOD, which most likely has taken the place of a former UST that was located in the general vicinity.</p> <p>1984 – A release of approximately 5,000-gallons of heating oil was released into the ground due to corrossions of 6,000-gallon heating oil UST. The heating oil reached the nearby tributary of Piscataway Creek to the northwest of the site and LOD, via a stormwater outfall and had impacted the creek for an unknown amount of distance. According to the spill report, approximately 4,500-gallon was recovered. Groundwater wells were installed around the UST and material was pumped out daily. Over 110-gallons was reportedly removed from two of the wells shortly after they were installed. Removal of free product from the wells is believed to have continued for up until April 1986, when no free product, sheen, or odors were observed any of the groundwater wells or stream.</p> <p>1991 – An OCP was opened for 2,000-gallon heating oil UST that failed its tank tightness test due to damage/corrosion of the fill pipe. No release was reported and fill pipe was repaired. The case received closure approximately a month later.</p> <p>In February 1991, a 4,000-gallon heating oil UST was excavated and removed from a structure called the Lane Building; however, the exact location of the building and former UST are unknown. The UST was found to be in good condition and no odors were observed in the soil from the excavation. A new 6,000-gallon heating oil was installed in-place of the former UST.</p>	Moderate

1, 4903	BOYS VILLAGE - CHELTANHAM ROUTE 301 (cont.)	0	<p>1993– A 4,000-gallon gasoline UST adjacent to the maintenance building (location unknown) failed its tank tightness test and was fixed without removal of the UST. Approximately 47 tons of impacted soil was excavated and removed from around the UST. Two monitoring wells and two tank field pipes were installed in the vicinity of the UST and a sampled for TPH and BTEX. Groundwater was not present in one of the monitoring wells, while benzene (11 ug/l), toluene (370 ug/l), ethylbenzene (440 ug/l), xylenes (2,800 ug/l) and TPH-GRO (7.3mg/l) were detected in the other groundwater sample. In 2001, the UST was excavated and removed from the site. Groundwater sampled from three nearby wells and analyze for benzene (11 to 171 ug/l), toluene (ND to 29.1 ug/l), ethylbenzene (ND to 2.2 ug/l), xylenes (ND to 61.0 ug/l), MTBE (7.6 to 98.9 ug/l), and TPH-GRO (ND to 11.4 ug/l). Confirmation samples collected from the excavation were all non-detect for TPH, MTBE and BTEX. The case received closure in 2002.</p> <p>1996 – A 3,000-gallon heating oil UST was excavated and removed from the ground, adjacent to the staff dormitory located in the northeastern portion of the site. The UST was found to be in poor condition; however, no odors or impacted soil was observed. The MDE inspector onsite instructed that the excavation be backfilled and the case was closed. Additionally, a release occurred inside a building onsite; however, the exact building or its location is unknown. According to available records, a water main broke, which flooded the boiler room. Oil was observed to be floating on the water in the basement. MDE advised to the facility that they should try to remove the free product and then pump the water into an open field. MDE inspected the site after the water had been pumped out and advised the facility to pump out the remaining fuel from the nearby 3,000-gallon heating oil UST, clean up residual fuel in the boiler room, and spread 10-10-10 fertilizer on area of oil stains on the grounds.</p> <p>2001 – A 2,000-gallon fuel oil UST was excavated and removed from the area adjacent to Building #9, over 1,000 feet east of the LOD. A small amount of impacted soil was excavated and removed from around the product line. The excavation was backfilled and AST was installed in place of the former UST. Soil samples collected from the bottom of the excavation detected concentrations of TPH-DRO at 8 mg/kg and 110 mg/kg. Based on the analytical results, the case was closed in 2006.</p> <p>2010 – One 1,000-gallon heating oil UST and 550-gallon heating oil UST were excavated and removed from a structure approximately 2,200 feet northeast of the LOD.</p>	Moderate

Ranking Rationale Site Summary		
<p>The LOD is located within the south-central portion of the Cheltenham Youth Detention Center, north of Surratts Road, in Cheltenham, Maryland. The detention center spans both to the southwest and northeast of the LOD and includes multiple structures on a large open campus. A pond is observed south of the LOD. A cemetery is observed further to the southeast. The detention center was present since at least 1960. The large structure was constructed in central portion of the LOD in approximately 1988. Another large structure directly southwest of the LOD was constructed sometime between the late 1980s and early 1990s. The facility has 26 closed heating oil, diesel, and gasoline USTs ranging in size from 500 to 6,000 gallons. There are twelve OCP cases associated with this facility. A PIA request was submitted to MDE to review the available information; however, only nine of the twelve case reports were provided as the other three had been destroyed per MDE's file retention policy. Based on a review of the available case files, the majority of the USTs removed from the facility had impacted soil and/or groundwater beneath them. In addition, the exact locations of the USTs were not adequately documented and many of the site location figures that were provided in the case files were hand drawn and not to scale. It is believed that each structure on the site had at least one petroleum UST associated with them. The USTs were likely installed next to each of the historical buildings; therefore, there is a possibility that one or more USTs were previously located within the boundaries of the LOD. Due to lack of information relating to these records, further investigation is warranted prior to intrusive groundwork to determine if environmental media within the LOD has been impacted.</p>

1, 4903	BOYS VILLAGE - CHELTANHAM ROUTE 301	0	<p>ICIS, FINDS/FRS, - Air permit, no violations.</p> <p>OCP, USTs – The facility has 26 closed heating oil, diesel, and gasoline USTs ranging in size from 500 to 6,000-gallons. The USTs were closed between 1991 and 2014. There are twelve OCP cases associated with this facility, three of which had reported releases and remediation/cleanup. A heating oil UST was most likely installed next to each of the historical buildings onsite; therefore, there is moderate chance that a UST or multiple USTs were previously located within the boundaries of the LOD. Many of the UST closures were not documented or the files have been destroyed per MDE's file retention policy.</p> <p>1984 – A release of approximately 5,000-gallons of heating oil was released into the ground due to corrossions of 6,000-gallon heating oil UST. The heating oil reached the nearby tributary of Piscataway Creek to the northwest of the site and LOD, via a stormwater outfall and had impacted the creek for an unknown amount of distance. According to the spill report, approximately 4,500-gallon was recovered. Groundwater wells were installed around the UST and material was pumped out daily. Over 110-gallons was reportedly removed from two of the wells shortly after they were installed. Removal of free product from the wells is believed to have continued for up until April 1986, when no free product, sheen, or odors were observed any of the groundwater wells or stream.</p> <p>1991 – An OCP was opened for 2,000-gallon heating oil UST that failed its tank tightness test due to damage/corrosion of the fill pipe. No release was reported and fill pipe was repaired. The case received closure approximately a month later.</p> <p>In February 1991, a 4,000-gallon heating oil UST was excavated and removed from a structure called the Lane Building; however, the exact location of the building and former UST are unknown. The UST was found to be in good condition and no odors were observed in the soil from the excavation. A new 6,000-gallon heating oil was installed in-place of the former UST.</p>	Moderate

1, 4903	BOYS VILLAGE - CHELTANHAM ROUTE 301 (cont.)	0	<p>1993– A 4,000-gallon gasoline UST adjacent to the maintenance building (location unknown) failed its tank tightness test and was fixed without removal of the UST. Approximately 47 tons of impacted soil was excavated and removed from around the UST. Two monitoring wells and two tank field pipes were installed in the vicinity of the UST and a sampled for TPH and BTEX. Groundwater was not present in one of the monitoring wells, while benzene (11 ug/l), toluene (370 ug/l), ethylbenzene (440 ug/l), xylenes (2,800 ug/l) and TPH-GRO (7.3mg/l) were detected in the other groundwater sample. In 2001, the UST was excavated and removed from the site. Groundwater sampled from three nearby wells and analyze for benzene (11 to 171 ug/l), toluene (ND to 29.1 ug/l), ethylbenzene (ND to 2.2 ug/l), xylenes (ND to 61.0 ug/l), MTBE (7.6 to 98.9 ug/l), and TPH-GRO (ND to 11.4 ug/l). Confirmation samples collected from the excavation were all non-detect for TPH, MTBE and BTEX. The case received closure in 2002.</p> <p>1996 – A 3,000-gallon heating oil UST was excavated and removed from the ground, adjacent to the staff dormitory located in the northeastern portion of the site. The UST was found to be in poor condition; however, no odors or impacted soil was observed. The MDE inspector onsite instructed that the excavation be backfilled and the case was closed. Additionally, a release occurred inside a building onsite; however, the exact building or its location is unknown. According to available records, a water main broke, which flooded the boiler room. Oil was observed to be floating on the water in the basement. MDE advised to the facility that they should try to remove the free product and then pump the water into an open field. MDE inspected the site after the water had been pumped out and advised the facility to pump out the remaining fuel from the nearby 3,000-gallon heating oil UST, clean up residual fuel in the boiler room, and spread 10-10-10 fertilizer on area of oil stains on the grounds.</p> <p>2001 – A 2,000-gallon fuel oil UST was excavated and removed from the area adjacent to Building #9, over 1,000 feet east of the LOD. Project Area Site Descriptions

LOD ID: WAS-1004	Site Rank: Low	Figure Location: 
Quadrant:	SW	
Watershed:	WAS	
Street Address/Nearest Cross Streets	Central median and eastern side of Indian Head Highway, north of Livingston Road	
City	Accokeek	
County	Prince George's	
Type of property	ROW	
Ranking Rationale Site Summary		
<p>The LOD is located along the central median and eastern side of Indian Head Highway (MD 210), north of Livingston Road, in Accokeek, Maryland. The area was primarily forested land until the late 1980s, when development was observed to the south. An MDE VCP site is located southwest of the LOD. This site is a vacant 11 acre parcel located approximately 360 feet west of the LOD. In 1999, a UST removal at the Accokeek Gas and Go Service Station, south of the site and approximately 1,000 feet southwest of the LOD, led to the opening of an OCP case. Investigations conducted determined groundwater on the site had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In August 2009, a Phase II environmental site assessment was conducted determined that groundwater beneath the property had been impacted with elevated levels of petroleum compounds. In 2010, the owners of the site entered into the MDE VCP program and in February 2011, MDE issued a no further remediation determination for the site and the case was closed. Information on MDE's website for the site stated that surface water and groundwater on the site flows northwest (crossgradient of the LOD) towards Farmington Creek. Based on available site characterization information, the impacted groundwater is not believed to have affected the LOD.</p>

Project Area Site Descriptions

DATABASE SEARCH LISTINGS				
ERIS Site ID	Name/Address	Distance (Ft.)	Listing of concern (OCP Cases, USTs, ASTs, ERNS/HMIRS/Spills, LRP, VCP, NPL, SEMS, SEMS ARCHIVE)	Risk to LOD
6486	Accokeek – Vacant Parcels 15909 Hickory Knoll Road	360	LUC, SHWS, VCP – This site is a vacant 11 acre parcel located approximately 360 feet west of the LOD. The property consists primarily of undeveloped forested land. In 1999, an underground storage tank (UST) removal at the Accokeek Gas and Go Service Station, south of the site and approximately 1,000 feet southwest of the LOD, led to the opening of an MDE Oil Control Program (OCP) case (1999-1655PG1). The OCP investigated environmental impacts due to a petroleum release from the USTs and conducted further investigations in 2003 and 2004 that indicated the groundwater on the site had been impacted from the off-site petroleum release. In July 2009, the OCP issued a Notice of Compliance and the case was considered closed. In December 2008, a Phase I environmental site assessment was conducted at the site. This assessment indicated that the site had one recognized environmental condition which was the former USTs located at an adjacent property. A Phase II environmental site assessment was conducted at the properties in August 2009 and sampling indicated that the property had been impacted by elevated levels of petroleum compounds in groundwater. Additional soil sampling for metals and semi-volatile organic compounds was conducted at the property to assess potential impacts from debris dumping. Soil gas sampling was performed in July 2009 to determine the extent and nature of risks associated with sub-surface vapors from the off-site USTs. In 2010, the owners of the site entered into the MDE VCP program and in February 2011, MDE issued a no further remediation determination for the site and the case was closed. Information on MDE's website for the site stated that surface water and groundwater on the site flows northwest (crossgradient of the LOD) towards Farmington Creek. Based on available information on the site characterization activities performed on the gas station to the south, impacted groundwater is not believed to have affected the LOD.	Low

HISTORICAL IMAGES SUMMARY		
Date Range	Property Use	Source
1960	Indian Head Highway is present, but as a 2-lane road. The surrounding area is observed to be primarily vacant forested land.	Aerial
