

T.6 INDIVIDUAL COMMENT RESPONSES

Introduction

The Federal Highway Administration (FHWA), as the Lead Federal Agency, and the Maryland Department of Transportation State Highway Administration (MDOT SHA), as the Local Project Sponsor, have reviewed and considered all comments received on the Draft Environmental Impact Statement (DEIS) and Supplemental Draft Environmental Impact Statement (SDEIS). Comments that were submitted by the public and not associated with an agency, business, community organization, elected official, or classified as a form letter have been responded to below. Duplicate comments have only been listed once, and therefore comment numbers are not sequential. Refer to Appendix T Section T.1 for agency comment responses, T.2 for community organization comment responses, T.3 for elected official comment responses, T.4 for business comment responses, and T.5 for form letter comment responses. For additional comment responses, refer to Chapter 9 of the FEIS.

T.6.A Draft Environmental Impact Statement Individual Comments and Responses

T.6.A.1 Draft Environmental Impact Statement Individual Comment Response Table

Commenter	#	Reference to Comment	Response
Aabel, Devota	I-840	Refer to Appendix T Page DEIS C-1 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>
Aaronson, Wendy	I-1145	Refer to Appendix T Page DEIS C-2 thru 3 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Commenter	#	Reference to Comment	Response
Abeles, Nancy	I-1136	Refer to Appendix T Page DEIS C-4 thru 7 for your exact comment.	<p>Thank you for your comment on P3 projects, air quality, effects of the pandemic, traffic concerns, and environmental impacts. Regarding your comment on our project conflicting with TPB's Air Quality Conformance Analysis recordation is incorrect, the Study is included in the Air Quality Conformity Analysis that accompanies the Visualize 2045 Plan. That analysis showed that the transportation program, <u>which includes the Study</u>, would not cause or contribute to a violation of the Ozone NAAQS. The National Capital Region Transportation Planning Board (TPB) is currently updating the Visualize 2045 plan, to be completed in 2022.</p> <p>Refer to Appendix A & B of the FEIS for additional information on Traffic and MDOT SHA's Application for Interstate Access Point Approval.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Commenter	#	Reference to Comment	Response
Abell Blake, Linda	I-443	Refer to Appendix T Page DEIS C-8 for your exact comment.	<p>Thank you for your comment concerning impacts to your property. As described in the Supplemental DEIS, your property is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>
Abramowitz, Georgette	I-660	Refer to Appendix T Page DEIS C-9 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p>
Abramson, Allison	I-379	Refer to Appendix T Page DEIS C-10 for your exact comment.	<p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Adams, Linda	I-701	Refer to Appendix T Page DEIS C-11 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>
Adams, Lowell	I-1085	Refer to Appendix T Page DEIS C-12 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Appendix T for the Washington Biologist Field Club comment response for additional responses to your comments.</p>
Adams, Miranda	I-1162	Refer to Appendix T Page DEIS C-13 for your exact comment.	<p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p>

Commenter	#	Reference to Comment	Response
			<p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>
Adelson, Ross	I-1230	Refer to Appendix T Page DEIS C–14 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Adkins, Grey	I-146	Refer to Appendix T Page DEIS C–15 thru 16 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Aguilera, Ana	I-1002	Refer to Appendix T Page DEIS C–17 for your exact comment.	<p>Thank you for your comment concerning impacts to the Upper Watts Branch Park and Woodley Gardens Park. The Preferred Alternative limits of disturbance, as shown in Appendix D of the Supplemental DEIS, would not result in physical impacts to Upper Watts Branch Park or Woodley Gardens Park. Sliver impacts to properties along I-270 within the Woodley Gardens neighborhood are proposed for elements such as roadside grading, on-site drainage and stormwater management, and noise barrier replacement/construction. These partial property acquisitions are considered ones that do not cause a business or residential relocation and have been assumed where a principle building of a residence, business, or community facility is located more than 20 feet from the Preferred Alternative limits of disturbance.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Ailanthus, Caroline	I-1530	Refer to Appendix T Page DEIS C–18 for your exact comment.	<p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>

Commenter	#	Reference to Comment	Response
			Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Alagash, John	I-9	Refer to Appendix T Page DEIS C–19 for your exact comment.	MDOT SHA and FHWA reviewed and approved the work performed by the consultants. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.
Alaskari, Husain	I-547	Refer to Appendix T Page DEIS C–20 for your exact comment.	Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.
Alderman, Elliott	I-235	Refer to Appendix T Page DEIS C–21 for your exact comment.	Thank you for your comment concerning impacts to the Forest Glean area, Sligo Creek, and Rock Creek Park. As described in the Supplemental DEIS, these resources are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.
Alexander, Lisa	I-57	Refer to Appendix T Page DEIS C–22 for your exact comment.	Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. quality. Refer to Chapter 9, Section 3.4.G for a response to climate change considerations. Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost. Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.
Ali, Ryana	I-844	Refer to Appendix T Page DEIS C–23 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.
Allagood, Kelsey	I-1326	Refer to Appendix T Page DEIS C–24 for your exact comment.	Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4.G for a response to climate change considerations. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.

Anderson, David	I-779	Refer to Appendix T Page DEIS C-38 for your exact comment.	Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Andreev, Andrey	I-599	Refer to Appendix T Page DEIS C-39 for your exact comment.	Thank you for your comment concerning traffic noise. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, support for the construction of noise barriers throughout the corridor is warranted. Noise analysis follows the noise policy and guidelines as set forth by MDOT SHA in their Highway Noise Abatement Planning and Engineering Guidelines. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions. MDOT SHA developed their Highway Noise Abatement Planning and Engineering Guidelines to provide detailed implementation guidance, critical background information, rationale, and other comprehensive criteria associated with a highway noise study for Federally funded projects in the state of Maryland. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation. Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat. Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.
Andreev, Andrey	I-661	Refer to Appendix T Page DEIS C-40 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Andriessens, Namrata	I-909	Refer to Appendix T Page DEIS C-41 for your exact comment.	Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.
Ankrapp, Sarah	I-957	Refer to Appendix T Page DEIS C-42 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.6A for a response on opposition to managed lanes or tolling public roads. Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.

Artrip, Joseph	I-162	Refer to Appendix T Page DEIS C-56 for your exact comment.	<p>Thank you for your comment on the I-270 Pre NEPA study. The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

Atrakchi, Falah	I-381	Refer to Appendix T Page DEIS C–62 for your exact comment.	<p>Thank you for your comment concerning impacts to the Rockshire neighborhood. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements; therefore, no homes would be taken due to the proposed roadway widening. Sliver impacts to properties along I-270 are proposed for elements such as roadside grading, retaining wall construction, on-site drainage and stormwater management, and noise barrier replacement/construction. These partial property acquisitions are considered ones that do not cause a business or residential relocation and have been assumed where a principle building of a residence, business, or community facility is located more than 20 feet from the Preferred Alternative limits of disturbance.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>

Baldwin, Stephen	I-708	Refer to Appendix T Page DEIS C–108 thru 110 for your exact comment.	<p>Thank you for your comment concerning adverse impacts. Regarding your comment on Morningstar Tabernacle No.88 Moses Hall and Cemetery, MDOT SHA has been continuing investigation of the Morningstar Tabernacle No.88 Moses Hall and Cemetery, and consultation with community representatives since publication of the DEIS. Based on the current historic boundary, the Preferred Alternative will avoid direct impacts to the Morningstar Tabernacle No. 88 Moses Hall and Cemetery. Additionally, no atmospheric, audible, or visual effects to the property have been identified from the Preferred Alternative. No diminishment of location, design, setting, materials, workmanship, feeling or association has been found in these areas. The project will be governed by a programmatic agreement, including a treatment plan that specifies the methods, limits and consultation procedures for further investigation of areas with the potential for additional burials outside of the current historic boundary, no specific determination of effects to the Morningstar Tabernacle No. 88 Moses Hall and Cemetery will be made at this time, and will be made following completion of the additional investigations specified in the programmatic agreement and treatment plan (Refer to FEIS, Appendix J).</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p>

As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p>
Barone, Gary	I-998	Refer to Appendix T Page DEIS C–122 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Barone, Steve	I-1006	Refer to Appendix T Page DEIS C–123 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>
Barone, Suzanne	I-1329	Refer to Appendix T Page DEIS C–124 thru 126 for your exact comment.	<p>Thank you for your comment concerning impacts to your property and the Locust Hill Estates neighborhood. As described in the Supplemental DEIS, this neighborhood is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>

Barrows, Edward	I-1200	Refer to Appendix T Page DEIS C–130 for your exact comment.	<p>We appreciate the ecological importance of Plummers Island and the greater Potomac Gorge, which include rare habitats and rare, threatened, and endangered (RTE) organisms. We acknowledge that the long-term biological studies conducted on and around the island have contributed to the understanding of these important habitats and the wildlife they support and impacts would not only impact these diverse habitats and wildlife, but would affect a place that is important to many people for recreation. MDOT SHA has limited impact to Plummers Island and the Potomac Gorge to the greatest extent practicable, while maintaining constructability of the project. MDOT SHA conducted a four-season RTE plant survey in 2020 to identify the RTE plant species located within the project area. MDOT SHA is coordinating closely with NPS to develop an ecosystem restoration plan to limit impacts as much as possible and mitigate for impacts that cannot be avoided and will continue to coordinate with the Washington Biologists Field Club to ensure your concerns are heard and responded to.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Appendix T for the Washington Biologist Field Club comment response for additional responses to your comments.</p>

Barsky, George	I-1330	Refer to Appendix T Page DEIS C–140 for your exact comment.	Refer to your comment above, number I-285, for a response to your comment.
Barsky, George	I-1286	Refer to Appendix T Page DEIS C–139 for your exact comment.	<p>Thank you for your comment. MDOT SHA considered four separate, standalone transit alternatives: 14A (heavy rail), 14B (light rail), 14C (fixed guideway Bus Rapid Transit, off current alignment), and 15 (dedicated Bus Managed Lanes on existing alignment). None of these alternatives would address existing traffic or long-term traffic growth on I-495 and I-270.</p> <p>With respect to either heavy or light rail alternatives, the 2002 Capital Beltway/Purple Line Study (2002 Study) analyzed circumferential rail corridors (approximately 42 miles) along the Capital Beltway Corridor. This analysis concluded: “Congestion on the Beltway itself as well as demand on the other transportation facilities is so great that no single highway or transit improvement will provide significant relief to the long-term demand,” (2002 Study, page S-17). It was also recommended that studies of the highway and transit alternatives be conducted separately because transit operates more efficiently if it serves areas where people live and work. Refer to DEIS, Appendix B. This analysis also stressed the basic fact that people do not live and work “on the Beltway” and that transit options generally service users by directly connecting activity (housing and work) locations.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Bartelt, Jeannette	I-86	Refer to Appendix T Page DEIS C–151 for your exact comment.	<p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Barthel, Nathan	I-760	Refer to Appendix T Page DEIS C–152 for your exact comment.	<p>Thank you for your comment on construction impacts, environmental impacts, autonomous vehicles, and costs. For your comment regarding autonomous vehicles, the expected influx of connected and autonomous vehicles (CAVs) will impact future traffic operations on all roads in Maryland, including I-495 and I-270. MDOT SHA participates in a statewide CAV working group (https://mva.maryland.gov/safety/Pages/MarylandCAV.aspx) to stay up to date on the latest research and industry projections. At this time, there are too many unknowns regarding how CAVs could affect demand and capacity to include CAVs directly in the traffic forecasts. Capacity will likely increase as vehicle spacing decreases, but the magnitude of the capacity increase is difficult to quantify based on the current research. Also, the benefits of more vehicles per lane may be offset by a potential increase in demand on the transportation network for some types of auto trips, including "mobility as a service" trips (people that can't afford their own car, but could call an autonomous vehicle for a solo trip) and "deadhead" trips (trips where the autonomous vehicle is empty, traveling to a parking lot or to the next pickup point). Therefore, the traffic projections for this Study apply traditional forecasting techniques, while being cognizant of the potential CAV impacts. However, it is anticipated that this project will be adaptable to accommodate CAVs because the proposed managed lanes will create a controlled environment with physical separation, new pavement, and clear delineations, features that are conducive to CAV use.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Barthel, Nathan	I-1159	Refer to Appendix T Page DEIS C–153 for your exact comment.	<p>Thank you for your comment on the traffic modeling. The modeling methodology is described in Section 3.1.1 of the DEIS and in more detail in Appendix C of the DEIS (Traffic Technical Report), specifically in Chapter 2. The organization that developed the regional forecasting model is the Metropolitan Washington Council of Governments (MWCOCG) and provided the latest version of the model to MDOT SHA to conduct project-specific forecasts for this study, as is standard practice.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

Commenter	#	Reference to Comment	Response
Bartlett, Olivia	I-1331	Refer to Appendix T Page DEIS C–154 thru 156 for your exact comment.	<p>Thank you for your comments. Maryland’s Traffic Relief Plan is statewide and includes I-95, I-695, I-495, I-270, MD 295, and the Smart Signals Program. Overall, this plan includes three elements: P3 Program, Baltimore Area Traffic Relief Plan, and Smart Traffic Signals. The Study focuses specifically on one element of that plan in one region of the state. The intent of the I-495 & I-270 P3 Program is to reduce congestion on I-495 and I-270 by seeking input from the private sector to design, build, finance, operate, and maintain improvements along the corridors. The plan is focused on transforming these overloaded interstates to allow people to reach their destinations faster and to remove overflow traffic from the local roads.</p> <p>The geographic scope of the Study, while large, is distinctly defined. It includes 37 miles of I-495 and 11 miles of I-270. Consistent with CEQ NEPA regulations 40 CFR 1502.4(a) and 1508.25(a), as well as FHWA NEPA regulations at 23 CFR 771.111(f), MDOT SHA and FHWA have identified the Study as an independent action that may proceed regardless of whether other actions of the Traffic Relief Plan or P3 Program are implemented.</p> <p>Furthermore, the identified scope of the Study has been sufficiently defined to be advanced with a project-level NEPA document. Consistent with FHWA regulations, other proposed actions, such as potential improvements to I-270 from I-370 to I-70, have been determined to possess independent utility from the Study (and other actions in the TRP and P3 Program) and thus will require separate project-level NEPA documents.</p> <p>Specifically, regarding your comment on the upper part of I-270. The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge. While the Monocacy National Battlefield is an important resource, it is not the reason that MDOT SHA is completing separate studies.</p> <p>The Study termini are based on major traffic generation points. At the northern terminus, I-370 links MD 200 (the Intercounty Connector), a major east-west tolled highway and traffic generator, with I-270. The average annual daily traffic volume on I-270 north of I-370 and MD 117 is approximately 10 percent less than the volume south of I-370 in existing conditions, indicating that a significant portion of traffic on I-270 comes from and goes to I-370.</p> <p>This Preferred Alternative with the Phase 1 South limits was identified after coordination with partner agencies, the public and stakeholders to respond directly to feedback received on the DEIS, and to align the NEPA approval with the P3 Program planned project phased delivery and permitting approach. While the Preferred Alternative does not include improvements to the remaining parts of I-495 within the Study limits, improvements on the remainder of the interstate system may still be needed in the future. Any such improvements would advance separately and would be subject to additional environmental studies and analysis and collaboration with the public, stakeholders and agencies.</p> <p>As part of the Study, the indirect and cumulative effects analysis was completed with the FEIS. The indirect and cumulative effects analysis considers the northern part of Montgomery County and Frederick County. Refer to FEIS, Chapter 5, Section 5.22 for details.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Bawer, Kenneth	I-151	Refer to Appendix T Page DEIS C–170 for your exact comment.	<p>Thank you for your comment concerning the Purpose and Need, public transit climate change, and stormwater runoff. Regarding your comment on stormwater runoff, impacts to local waterways will be minimized for any of the alternatives due to the strict permitting requirements in Maryland. Permitting requirements include: controlling stormwater runoff for the 10-year storm to match existing conditions, providing water quality treatment for all new impervious area and 50% of reconstructed existing impervious area to match the runoff characteristics of woods in good condition and managing the 2-year storm during construction so that sediment is not released to local waterways.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p>

Bialek, Ron	I-402	Refer to Appendix T Page DEIS C–187 for your exact comment.	<p>Thank you for your comments on impacts to public health, EJ populations, and air quality. Impacts to EJ populations (block groups) have been substantially reduced due to the selection of the Preferred Alternative/Phase 1 South limits in the SDEIS. Previously in the DEIS, 111 block groups were identified as EJ populations. In the SDEIS and FEIS under the 12-mile Preferred Alternative/Phase 1 South limits, 16 block groups were identified as EJ populations. This resulted in a reduction from 55 percent EJ populations to 24 percent EJ populations between the DEIS and the SDEIS/FEIS. Under the Preferred Alternative, impacts to 95 EJ block groups are avoided.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p>
Bialek, Ron	I-1332	Refer to Appendix T Page DEIS C–188 thru 191 for your exact comment.	<p>Thank you for your comment on public health and hazardous waste. Regarding your comment on hazardous waste, since the publication of the DEIS, a detailed review of the potential for hazardous materials and contaminate mobilization during construction for the Preferred Alternative was conducted for the SDEIS. Prior to acquisition of right-of-way and construction, Preliminary Site Investigations (PSIs) would be conducted to further investigate properties within and in the vicinity of the Preferred Alternative LOD that have a high potential for mitigation contaminated materials exposed during construction activities (refer to Section 5.10 of the FEIS for additional details). Proposed investigation for the high concern sites should adequately characterize surficial and subsurface soils, as well as groundwater, if anticipated to be encountered. Example locations would consider locations of previous releases, former/current/abandoned storage tanks, and inferred groundwater flow, as well as proposed soil/groundwater disturbance during construction. The Developer would be required to use best management practices to minimize the release of any hazardous materials during construction.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.O for a response to safety considerations.</p>

Commenter	#	Reference to Comment	Response
Bick, Bonnie	I-1338	Refer to Appendix T Page DEIS C–192 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Maryland requires that water quality treatment and quantity management be provided for all new pavement, therefore minimizing the impacts that this project will have on downstream waters, including the Chesapeake Bay. Maryland also requires that a minimum of 50 percent of existing reconstructed pavement be treated for water quality, therefore reducing the cumulative effect of untreated runoff downstream and ultimately to the Chesapeake Bay.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>

Brown, Lauren	I-404	Refer to Appendix T Page DEIS C–247 for your exact comment.	<p>Thank you for your comment on environmental impacts. Maryland and Virginia stormwater regulations will be met by this project and these regulations protect water quality of local waterways and wetlands. The project will maximize onsite stormwater management to the extent practicable and all stormwater quantity requirements will be met onsite. The portion of the stormwater quality requirements that cannot be met onsite will be met offsite as detailed in the Compensatory Stormwater Mitigation Plan that was appended to the SDEIS and a final draft will be appended to the FEIS. State regulations require that stormwater be met within affected watersheds and this project will adhere to these regulations. The Maryland Department of the Environment will not only review this project to ensure it adheres to stormwater regulations, it will also review water quality effects of the project as part of the Water Quality Certification process.</p> <p>A preliminary SWM analysis was completed for all alternatives and is documented in Chapter 2 of the DEIS and Section 2.3.2 of the SDEIS. Impacts to local waterways are not expected from any of the alternatives due to the strict permitting requirements in Maryland. Permitting requirements include: controlling stormwater runoff for the 10-year storm to match existing conditions, providing water quality treatment for all new impervious area and 50% of reconstructed impervious area to match the runoff characteristics of woods in good condition and managing the 2-year storm during construction so that sediment is not released to local waterways. Variances can be requested for minimal increases in stormwater runoff, however, detailed hydrologic calculations will be required to show that the minimal increases will not result in downstream flooding or erosion. Given the strict permitting requirements, impacts to local waterways and wetlands from stormwater runoff are not</p>

Burke, Andrew	I-1214	Refer to Appendix T Page DEIS C–260 for your exact comment.	<p>Thank you for your comment concerning impacts to the West End and Woodley Gardens neighborhood. The Preferred Alternative limits of disturbance, as shown in Appendix D of the Supplemental DEIS, do not result in physical impacts to Nelson Street or Woodley Gardens Park. Sliver impacts to properties along I-270 within the Woodley Gardens neighborhood are proposed for elements such as roadside grading, on-site drainage and stormwater management, and noise barrier replacement/construction. These partial property acquisitions are considered ones that do not cause a business or residential relocation and have been assumed where a principle building of a residence, business, or community facility is located more than 20 feet from the Preferred Alternative limits of disturbance.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>

Clifford, Patricia	I-606	Refer to Appendix T Page DEIS C– 308 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Cline, Judith	I-137	Refer to Appendix T Page DEIS C– 309 for your exact comment.	<p>Thank you for your comments concerning the Gude Drive interchange and stormwater runoff. Regarding your comments about the Gude Drive interchange, the proposed interchange at Gude Drive would provide access to and from the high-occupancy toll (HOT) managed lanes only. Ramps connecting Gude Drive with the general purpose lanes would not be provided. The current design concept includes direct access ramps connecting the HOT managed lanes with Gude Drive at a new four-leg intersection on the bridge structure that crosses over I-270. The elevation of the proposed ramps would generally not exceed the elevation of the existing Gude Drive bridge. Flyover ramps are not proposed as part of the current design concept for the Preferred Alternative. Because the ramps will be incorporated into the reconstructed Gude Drive bridge over I-270, the visual impacts resulting from the new access ramps would be minor compared to the existing conditions.</p> <p>Regarding your comment on stormwater runoff, this project will be required to control stormwater runoff from MDOT ROW to match existing stormwater runoff for the 10-year storm. Therefore, the total runoff will not increase to Watts Branch. In addition, the project will be required to treat all new impervious area and 50% of reconstructed impervious area (i.e. existing impervious area that is being reconstructed) to mimic the runoff characteristics of woods in good condition. The SWM concept provides full water quality required treatment for the runoff to Watts Branch near Gude Drive. Therefore, the pollution should not increase to Watts Branch.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study, including the No-Build Alternative.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>
Cline, Judy	I-1295	Refer to Appendix T Page DEIS C– 310 thru 311 for your exact comment.	<p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

			<p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>
Cluskey, Ken	I-165	<p>Refer to Appendix T Page DEIS C– 312 for your exact comment.</p>	<p>Thank you for your comment concerning impacts to Rock Creek Park. As described in the Supplemental DEIS, these resources are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on stormwater runoff, a conceptual identification of stormwater management (SWM) needs was considered in the DEIS, refer to Chapter 2, Section 2.7.2. The conceptual stormwater analysis was updated based on the Preferred Alternative in the SDEIS and FEIS. Refer to SDEIS, Chapter 2, Section 2.3.2 and SDEIS, Appendix C Draft Compensatory SWM Plan and FEIS, Chapter 3, Section 3.1.6 and FEIS, Appendix D Final Compensatory Stormwater Management Plan for details. The proposed SWM need was calculated based on the increase of impervious surface being added for each alternative. Maryland SWM law is very strict and requires that the stormwater runoff from the proposed work be controlled to match existing conditions for the 10-year storm.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study, including the No-Build Alternative.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Cohen, Moshe	I-656	Refer to Appendix T Page DEIS C–320 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Cohen, Rochelle	I-1345	Refer to Appendix T Page DEIS C–321 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>
Cohn, Deborah	I-111	Refer to Appendix T Page DEIS C–322 for your exact comment.	<p>Thank you for your comments. The limits of the I-495 & I-270 P3 Program includes the full length of I-495 and I-270, a distance of approximately 70 miles. The Managed Lanes Study, which the DEIS was focused on, includes 48 miles of improvements along I-495 from south of the George Washington Memorial Parkway in Fairfax County, Virginia, including replacement of the American Legion Bridge over the Potomac River, to west of MD 5 and along I-270 from I-495 to north of I-370, including the east and west I-270 spurs.</p> <p>Because the DEIS was only focused on the 48 miles of the Managed Lanes Study, the costs in Chapter 2 included improvements for those same 48 miles. Costs for potential improvements outside of the Managed Lane Study limits would be included in future environmental documents when they are studied to a similar level of detail. Estimate costs for other potential improvements that are outside the limits studied in a particular environmental document may be found in MDOT’s Constrained Long Range Plan.</p> <p>In the SDEIS (October 2021) and the FEIS, the Preferred Alternative was identified as Alternative 9 - Phase 1 South, which has reduced limits from the George Washington Memorial Parkway to east of MD 187, on I-270 from I-495 to north of I-370, and the I-270 east and west spurs. There is no action (i.e., no improvements) included at this time on I-495 east of the I-270 east spur. Similar to the DEIS, only the costs for the improvements in Phase 1 South were included in these documents because FHWA and MDOT SHA are required to provide them for the Preferred Alternative.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>

Coleman, Jacquelyn	I-263	Refer to Appendix T Page DEIS C–327 for your exact comment.	<p>Thank you for your comment on impacts to local network traffic. As noted in Section 3.3.6 of the DEIS, the net impact of the project will be an overall reduction in delay on the surrounding arterials such as Georgia Avenue and Colesville Road, despite some localized increases in arterial traffic near the managed lane access interchanges. The portions of the local road network with an anticipated increase in volumes are being evaluated in more detail as part of the FEIS, and mitigation will be proposed where needed to maintain acceptable operations per FHWA Interstate Access Point Approval guidelines. As described in the Supplemental DEIS, Georgia Avenue and Colesville Road are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.P for a response to socioeconomic impacts and impacts to the regional economy.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Crissman, Louise	I-24	Refer to Appendix T Page DEIS C–353 for your exact comment.	<p>Thank you for your comment supporting improvements to the American Legion Bridge. The Preferred Alternative includes the full replacement of ALB on I-495 spanning the Potomac River with a new, wider bridge on the existing alignment. On I-495 across the ALB, the Preferred Alternative consists of adding two new, high-occupancy toll managed lanes in each direction. The existing number of general purpose lanes in each direction would be maintained. For the managed lanes, consistent with your suggestion all tolls will be collected through electronic toll collection such as Easy Pass. As discussed further in reference below, the managed lanes will accommodate free passage for buses and additional bus routes and services are being evaluated by [transit study group]</p> <p>Options to double-deck the existing bridge or construct a new double-deck bridge to replace the ALB were considered in this Study during the evaluation of the Preliminary Range of Alternatives. A summary of the benefits and challenges associated with those options is provided below.</p> <p>Double-Deck Existing Bridge: The bridge superstructure width of one direction of travel in the proposed condition is approximately 124 feet. Because this is less than existing superstructure width, constructing a second deck over the existing bridge superstructure would provide sufficient width for the proposed lane configuration. Previous analysis of the existing</p>

Commenter	#	Reference to Comment	Response
			<p>substructure units indicate that the piers are currently loaded to the point that there is no additional capacity. The additional load from the second deck and the load from the vehicles cannot be accommodated by the existing substructure. In order to support the second deck, new substructure units independent from the existing would need to be constructed. These would consist of new pier caps spanning across the entire width of the existing bridge to newly constructed column elements supported on large, deep foundations. To minimize the impact of the foundation elements, they would likely consist of large diameter drilled shafts. The associated pier cap would span a minimum of 155 feet resulting in a significant concrete beam that would greatly increase the vertical profile of the top deck in order to provide sufficient vehicular under clearance to the lower deck. The approach roadway modifications necessary to transition from side-by-side to stacked roadways would extend well beyond the interchanges on each end of the ALB.</p> <p>New Double-Deck Bridge: Building on the discussion above, it is clear that the superstructure width of a completely new double-deck bridge would be 124 feet. To support both decks, the substructure would need to be wider than the superstructure. Again, assuming large drilled shaft foundations and columns, the width of the entire bridge would be approximately 144 feet which is wider than the existing bridge. Some minor additional impacts to the resources would be likely. To build an entirely new bridge, the construction phasing would ideally require the new bridge to be built off of the existing bridge alignment. This would allow conventional maintenance of traffic on the existing bridge while the new double-deck structure is completed. The approach roadway modifications required for the option to double-deck the existing bridge remain with this option.</p> <p>Regarding your comment on E-Z Pass, the managed lane alternatives would include tolling using an E-ZPass transponder along the entire length of the improvement – there would not be toll booths and vehicles would not need to slow down to pay a toll. The E-ZPass transponder would collect the tolls at highway speeds. Providing one tolling point only on the ALB would not accommodate the purpose and need for the project to address congestion along the entire length. Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>
Crocetta, Jacqueline	I-1086	Refer to Appendix T Page DEIS C–354 thru 355 for your exact comment.	<p>Thank you for your comment concerning traffic noise. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, a new barrier is proposed to provide noise mitigation to the Rose Hill and Roxboro communities and surrounding area. The proposed barrier is anticipated to extend from the interchange with MD 189 (Falls Road) to MD 28 (W. Montgomery Road) providing noise reduction to 44 impacted residences as well as to 44.67 non-impacted benefited residence. The odd decimal number is due to how non-residential properties, such as the school, church, nursing home, are equated to residences for purposes of analysis. This barrier will be re-evaluated during the final design process by the construction team.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p>

Cummings, Gary	I-892	Refer to Appendix T Page DEIS C-363 for your exact comment.	<p>Thank you for your comment on the I-270 Pre NEPA study. The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p>

Commenter	#	Reference to Comment	Response
Davis, Andrew	I-128	Refer to Appendix T Page DEIS C–382 for your exact comment.	<p>Thank you for your comment concerning construction costs. The construction costs estimated in the DEIS were adjusted to reflect complexities or assumed efficiencies that would result from large quantities of major items. For instance, structural costs were adjusted to account either for higher costs associated with more challenging bridge types or lower costs to account for the large number of bridges on the project. Similarly, low construction costs were used for paving materials due to the large quantities that would be needed for the long length of the improvements.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Davis, Patrice	I-310	Refer to Appendix T Page DEIS C–390 for your exact comment.	<p>Thank you for your comment on impacts to toll rates, low income communities and air quality. Studies based on actual user data shows that users of all income levels benefit from reduced travel times, including managed lane users and those who continue to use the general purpose or toll-free lanes. Managed lane usage is not closely correlated to income. The managed lanes would provide more options for people needing a reliable trip time. Nationwide research shows a majority of travelers choose to use managed lanes occasionally for critical or important trips, such as reaching an appointment or a school event. Relevant recent experience with similar facilities in Virginia on I-495 and I-95 further supports this conclusion. As reported in The Washington Post in 2018: “...most 495 and 95 express lane users are not affluent...”. According to another Post report, the average toll rates for Virginia’s managed lanes on I-495 and I-95 are \$5.40 and \$8.45 per trip, respectively. Experience in Virginia on I-495 shows that 82 percent of customers spend less than \$20 a month and 85 percent of trips were less than \$12. On the Virginia I-95 Express Lanes, 74 percent of customers spend less than \$20 a month.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p>

Davis, Robert	I-77	Refer to Appendix T Page DEIS C–397 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p>
Davis, Rory	I-311	Refer to Appendix T Page DEIS C–398 for your exact comment.	<p>Thank you for your comment on impacts to Air Quality at Julius West Middle School and the surrounding area. The air quality analysis for the I-495 and I-270 Managed Lanes Study (MLS) was performed in consultation with the Federal Highway Administration (FHWA) using approved models, methodologies, and guidance to analyze required pollutants. Because the Managed Lanes Study is located in an Environmental Protection Agency (EPA) attainment area for Carbon Monoxide (CO) and fine particulate matter (PM_{2.5}), no analysis of these pollutants was required, however, a CO analysis of emissions from affected intersections and interchanges was conducted for transparency and informational purposes since CO is a proxy for transportation emissions. The results of that analysis demonstrate that the worst-case interchanges and intersections for each Build and the No Build alternative, using very conservative assumptions, would not cause or contribute to a violation of the CO national ambient air quality standards (NAAQS) within the study corridor.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>
Davis, Rory	I-1254	Refer to Appendix T Page DEIS C–399 for your exact comment.	<p>Thank you for your comment on Julius West Middle School. The Preferred Alternative results in property impacts to two schools adjacent to the study corridors: 0.2 acres at Carderock Springs Elementary School and 0.6 acres at Julius West Middle School. No school facilities will be impacted as a part of the Preferred Alternative. For a response on air quality and public health see the below references.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p>

DeLang, Herman	I-262	Refer to Appendix T Page DEIS C-406 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p>
DeLang, Herman	I-795	Refer to Appendix T Page DEIS C-407 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p>
Delfert, Patrick	I-354	Refer to Appendix T Page DEIS C-408 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p>
Delgado, Alejandra	I-1353	Refer to Appendix T Page DEIS C-409 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase 1 South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. The SDEIS and FEIS included an updated EJ analysis based on the Preferred Alternative, Phase 1 South Limits. This change in limits resulted in significantly reduced EJ analysis area with no improvements in Prince George's County. Therefore there are no impacts to EJ or non-EJ communities in Prince George's County under the Preferred Alternative. Refer to FEIS, Chapter 5, Section 5.2.1 and FEIS Appendix F for details on the Final EJ analysis for the Study.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p>
Delgado, Emiliana	I-428	Refer to Appendix T Page DEIS C-410 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p>

Dembski, Sandra	I-429	Refer to Appendix T Page DEIS C–413 for your exact comment.	<p>Thank you for your comment concerning traffic noise for Carderock Springs community and the Carderock Springs Elementary School schoolyard. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, a new barrier is proposed to provide noise mitigation to portions of the Carderock Springs and the elementary school that are not behind an existing barrier to the east. This new barrier will be combined with a replacement barrier, which will replace the existing barrier, and is anticipated to extend from Persimmon Tree Road to Seven Locks Road. The barrier studied was 3,434 feet long and is variable height ranging from 20 to 32 feet. As part of the NEPA process documented in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, noise and air quality analyses were completed. Noise analysis follows the noise policy and guidelines as set forth by MDOT SHA in their Highway Noise Abatement Planning and Engineering Guidelines. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions. Within MDOT SHA's Highway Noise Abatement Planning and Engineering Guidelines are criteria, as mandated by FHWA, for determining whether a noise barrier is feasible and reasonable, and as indicated, the barrier as described for Carderock Springs is considered feasible and reasonable. However, as more detailed design progresses for this project, this barrier will be re-evaluated during the final design process.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Ditcheck, Neil	I-1204	Refer to Appendix T Page DEIS C-440 for your exact comment.	<p>Thank you for your comment regarding existing sound walls and noise along I-270 in the vicinity of Montrose Road. Per the NEPA design and analysis, portions of the existing noise wall between Tuckerman Lane and Montrose Road will remain in place and other portions will need to be removed and replaced in new location. MDOT SHA's intention that any barrier that is anticipated to be displaced for roadway improvements or stormwater management conflicts, will be replaced, with the replacement noise barrier meeting or exceeding the noise abatement performance of the existing noise barriers to be replaced. In the case of this barrier system, the replacement and existing barriers were modeled as a single barrier system to evaluate barrier performance. In the supporting Noise Analysis Technical Report Addendum, noise levels in the column labeled 2045 Predicted Noise Level (Leq) represent the predicted build condition without a noise barrier. The next column is the reduction in noise levels with a barrier and the last column is resultant noise level with the barrier. The analysis is completed in this manor to determine whether the noise barrier reduction meets the requirements of SHA Noise Policy. No traffic noise barrier can eliminate traffic noise. Rather they are introduced to considerably reduce noise levels for people living next to highways and are most effective within 200 feet of a highway.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>

Dittmann, Michael	I-375	Refer to Appendix T Page DEIS C–441 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Ditzler, Barbara	I-670	Refer to Appendix T Page DEIS C–442 thru 443 for your exact comment.	<p>Thank you for your comment. Regarding your comment on the study from the Maryland Transportation institute, the I-495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>

Ditzler, Brian	I-312	Refer to Appendix T Page DEIS C-444 for your exact comment.	<p>Thank you for your comment on environmental impacts and additional alternatives. For your comment on hazardous waste, since the publication of the DEIS, a detailed review of the potential for hazardous materials and contaminate mobilization during construction for the Preferred Alternative was conducted for the SDEIS. Prior to acquisition of right-of-way and construction, Preliminary Site Investigations (PSIs) would be conducted to further investigate properties within and in the vicinity of the Preferred Alternative LOD that have a high potential for mitigation contaminated materials exposed during construction activities (refer to FEIS Chapter 5, Section 5.10 of the FEIS for additional details). Proposed investigation for the high concern sites should adequately characterize surficial and subsurface soils, as well as groundwater, if anticipated to be encountered. Example locations would consider locations of previous releases, former/current/abandoned storage tanks, and inferred groundwater flow, as well as proposed soil/groundwater disturbance during construction. The Developer would be required to use best management practices to minimize the release of any hazardous materials during construction.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>

Donoso, Ignacio	I-138	Refer to Appendix T Page DEIS C-449 for your exact comment.	<p>Thank you for your comment concerning impacts to the AI Marah community. As part of this project, MDOT SHA has determined that your community qualifies for a sound barrier. The new sound barrier will be constructed along the inner loop of I-495, from the Cabin John Parkway ramp onto I-495 to the River Road interchange. The barrier will be constructed as close to the roadway as possible to minimize or avoid property impacts. At this time, there is no mechanism for the state to provide noise abatement to your community outside of a roadway improvement project such as the Managed Lanes Study.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>

Commenter	#	Reference to Comment	Response
Eason, David	I-1252	Refer to Appendix T Page DEIS C-475 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Easton, Susan	I-123	Refer to Appendix T Page DEIS C-476 thru 480 for your exact comment.	<p>Thank you for your comment on property, environmental, and health impacts, traffic, project cost, and Environmental Justice (EJ). Regarding your comment on EJ, The portion of the EJ Analysis presented in the DEIS was conducted in compliance with Title VI of the 1964 Civil Rights Act; Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations; USDOT Order 5610.2(a): Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (2012 revision); FHWA Order 6640.23A: FHWA Actions to Address Environmental Justice in Minority Populations and Low-Income Populations; and FHWA memorandum Guidance on Environmental Justice and NEPA (2011); and other applicable agency guidance. Per the methodology approved by FHWA and Cooperating Agencies, the first steps of the EJ Analysis were completed in the DEIS and SDEIS, and the remaining steps, including a comparison of impacts from the Preferred Alternative to EJ populations versus impacts to non-EJ populations, are completed in this FEIS. See FEIS, Chapter 5.21 for detail on the EJ Analysis methodology and steps.</p> <p>Regarding your comment on stormwater management (SWM) and the degradation of waterways, this project will be required to control stormwater runoff from the MDOT ROW to match existing stormwater runoff for the 10-year storm. Permit variances can be requested for small increases, however, detailed hydrologic calculations must be performed in order to show that the increase will not cause downstream flooding or erosion. This project will also be required to provide water quality treatment for all new pavement and 50% of reconstructed pavement to mimic woods in good condition. The NEPA study assumed that 25% of existing lanes plus both shoulders would be reconstructed, resulting in 44% of existing pavement on 495 and 39% of existing pavement on 270 being reconstructed. If detailed design results in more reconstructed pavement, water quality treatment will be required for 50% of the total reconstructed pavement. On-site water quality SWM must be maximized, however, if the full water quality requirements cannot be met onsite, offsite water quality SWM will be allowed within the same 6-digit watershed. The SWM concept design provides 95% of water quality requirements onsite and 5% offsite. Given the high level of water quality treatment onsite and that the offsite will be provided within the same 6-digit watershed of the project, downstream channels should not degrade further.</p> <p>The decision concerning the scope of analysis to be conducted under NEPA lies within the discretion of the project proponent and lead federal agency. Depending on the factual circumstances, a programmatic or a project-specific analysis could be conducted to fulfill NEPA's procedural requirements. In this case, proceeding with a project-level review for the Study was entirely appropriate.</p> <p>Maryland's Traffic Relief Plan is statewide and includes I-95, I-695, I-495, I-270, MD 295, and the Smart Signals Program. Overall, this plan includes three elements: P3 Program, Baltimore Area Traffic Relief Plan, and Smart Traffic Signals. The Study focuses specifically on one element of that plan in one region of the state. The intent of the I-495 & I-270 P3 Program is to reduce congestion on I-495 and I-270 by seeking input from the private sector to design, build, finance, operate, and maintain improvements along the corridors. The plan is focused on transforming these overloaded interstates to allow people to reach their destinations faster and to remove overflow traffic from the local roads.</p> <p>The geographic scope of the Study, while large, is distinctly defined. It includes 37 miles of I-495 and 11 miles of I-270. Consistent with CEQ NEPA regulations 40 CFR 1502.4(a) and 1508.25(a), as well as FHWA NEPA regulations at 23 CFR 771.111(f), MDOT SHA and FHWA have identified the Study as an independent action that may proceed regardless of whether other actions of the Traffic Relief Plan or P3 Program are implemented.</p> <p>Furthermore, the identified scope of the Study has been sufficiently defined to be advanced with a project-level NEPA document. Consistent with FHWA regulations, other proposed actions, such as potential improvements to I-270 from I-370 to I-70, have been determined to possess independent utility from the Study (and other actions in the TRP and P3 Program) and thus will require separate project-level NEPA documents.</p> <p>Regarding your comment on providing documentation, pursuant to accepted FHWA policy, the EIS documents were drafted to enhance readability and accessibility for all members of the public. These documents summarized an enormous amount of underlying data and information related to the proposed action, with complete references to supporting technical reports. Stakeholders or concerned citizens could easily access the 19 technical reports appended to the DEIS and updated reports in the SDEIS to obtain a higher level of detail and specificity concerning virtually any topic related to the proposed action. These reports, comprising close to 18,000 pages in the DEIS and approximately 8,200 pages in the SDEIS and supporting documentation, detail the extensive analysis undertaken by MDOT SHA and reviewed by FHWA and cooperating agencies prior to publication of the DEIS and SDEIS. The reports reflect extensive coordination between local, state, regional and Federal agencies, as well as input from the stakeholders and communities since Spring 2018. The methodologies applied to conduct the analyses reflected in those technical reports were reviewed and approved by the applicable lead federal and state agencies. Resource and regulatory agencies were also consulted on the methodologies and were afforded the opportunity to review and comment on the analyses before being conducted and once the analyses were finalized. As a result, the structure and</p>

Elkind, Jonathan	I-272	Refer to Appendix T Page DEIS C–490 thru 491 for your exact comment.	<p>Thank you for your comment on traffic impacts, induced demand and other Maryland P3 projects. MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>Our study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>

Esposito, Joesph P.	I-581	Refer to Appendix T Page DEIS C–503 thru 505 for your exact comment.	<p>Thank you for your comment concerning traffic noise for Carderock Springs community and the Carderock Springs Elementary School schoolyard. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, a new barrier is proposed to provide noise mitigation to portions of the Carderock Springs and the elementary school that are not behind an existing barrier to the east. This new barrier will be combined with a replacement barrier, which will replace the existing barrier, and is anticipated to extend from Persimmon Tree Road to Seven Locks Road. The barrier studied was 3,434 feet long and is variable height ranging from 20 to 32 feet. This barrier will be re-evaluated during the final design process by the construction team.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>

Fardoust, Roya	I-535	Refer to Appendix T Page DEIS C–518 for your exact comment.	<p>Thank you for your comment concerning traffic noise. The results of the updated analysis on the Preferred Alternative in the FEIS showed 59 NSAs in the study area (representing a reduction of 69 NSAs from the DEIS and a reduction from 64 in the SDEIS). Within these NSA's, several sound barrier scenarios were considered: existing sound barriers to remain in place; existing sound barriers displaced by proposed construction to be replaced by a reconstructed barrier on a new alignment; existing sound barriers that were evaluated for extensions; and new sound barriers on new alignment. For this analysis, sound barriers that are anticipated to be displaced for roadway improvements or stormwater management conflicts, have been analyzed to verify that there is no decrease in performance as replacement barriers. Any barriers that are displaced, will be re-evaluated during the final design process to verify that replacement sound barriers meet or exceed the noise abatement performance of the existing noise barriers to be replaced.</p> <p>Sound barriers are designed to lower the overall traffic noise level but will not eliminate the noise entirely. The sound barrier is not intended to mitigate point source noise emissions such as air brakes, motorcycles and modified exhaust systems on vehicles and trucks. Sound travels in waves, and is dependent on ground cover, topography and atmospheric conditions as well as intervening obstacles (such as sound barriers, buildings or vegetation). Sound levels are measured on a logarithmic scale, which means that in order for there to be a barely perceptible (3 dBA) increase in noise, either traffic volume would need to double and still operate at high speeds, or the roadway would need to move significantly closer to the residence. Neither of these conditions are proposed as a result of the build alternative, so noise is not expected to become significantly louder.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Fields, Ronnie	I-406	Refer to Appendix T Page DEIS C–535 for your exact comment.	<p>Thank you for your comment concerning traffic noise. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, a new barrier is proposed to provide noise mitigation to the Rose Hill Falls community and surrounding area. The proposed barrier is anticipated to extend from the interchange with MD 189 (Falls Road) to MD 28 (W. Montgomery Road) providing noise reduction to 44 impacted residences as well as to 44.67 non-impacted benefited residence. The odd decimal number is due to how non-residential properties, such as the school, church, nursing home, are equated to residences for purposes of analysis. This barrier will be re-evaluated during the final design process by the construction team.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p>

			Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Frick, Paul	I-548	Refer to Appendix T Page DEIS C–577 for your exact comment.	Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.
Frick, Valerie	I-522	Refer to Appendix T Page DEIS C–578 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts. Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.
Friedman, Heidi	I-1463	Refer to Appendix T Page DEIS C–579 thru 584 for your exact comment.	Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. Refer to Chapter 9, Section 3.4.G for a response to climate change considerations. Refer to Chapter 9, Section 3.4.L for a response to public health impacts. Refer to Appendix T for the Farmland Civic Association comment response for additional responses to your comments.
Friend, Karen	I-622	Refer to Appendix T Page DEIS C–585 thru 586 for your exact comment.	Thank you for your comment concerning impacts to your property and the Woodley Gardens neighborhood. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements; therefore, no homes would be taken due to the proposed roadway widening. Sliver impacts to properties along I-270 within the Woodley Gardens neighborhood are limited and proposed for elements such as roadside grading, on-site drainage and stormwater management, and noise barrier replacement/construction. These partial property acquisitions are considered ones that do not cause a business or residential relocation and have been assumed where a principle building of a residence, business, or community facility is located more than 20 feet from the Preferred Alternative limits of disturbance. Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads. Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation. Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management. Refer to Chapter 9, Section 3.4.O for a response to safety considerations. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.

Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>
Gage, Julia	I-1272	Refer to Appendix T Page DEIS C-595 for your exact comment.	<p>Thank you for your comment concerning impacts to the North College Park community. As described in the Supplemental DEIS, the North College Park area is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>
Gagliardi, Dominic	I-820	Refer to Appendix T Page DEIS C-596 for your exact comment.	<p>Thank you for your comment regarding induced demand. MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>Our study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Gagliardi, Jeremy	I-1054	Refer to Appendix T Page DEIS C-597 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Gans, Richard	I-536	Refer to Appendix T Page DEIS C-607 for your exact comment.	<p>Thank you for your comment concerning traffic noise and sound barriers in the vicinity of the Fallsmead community. Currently, a noise barrier exists along southbound I-270 from the southbound ramp from MD 28, continuing along I-270 to just short of the Ramp to MD 189. Per the current design evaluated for the SDEIS, this barrier will not be impacted by the proposed improvements and will remain in place. Near the southern end a section of wall will be displaced and relocated to a new location and an extension is proposed to provide additional benefits for residential properties closer to MD 189. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, the combination of existing, replaced, and new barrier totaling 4,666 feet in length effectively reduces noise within the community and meets MDOT SHA's noise reduction requirements. No traffic noise barrier can eliminate traffic noise. Rather they are introduced to considerably reduce noise levels for people living next to highways and are most effective when closer to the highway.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>

			<p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Gentry, Richard	I-347	Refer to Appendix T Page DEIS C–618 for your exact comment.	<p>Thank you for your comment on highway noise associated with the proposed I-270 improvement in the vicinity of Montrose Road. Between Tuckerman Lane overpass and the Montrose Road interchange the proposed Preferred Alternative has minimized the limits of disturbance, and therefore has minimized the impact to the area between the proposed improvements and the community. As part of the NEPA process documented in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, noise and air quality analyses were completed. Noise analysis follows the noise policy and guidelines as set forth by MDOT SHA in their Highway Noise Abatement Planning and Engineering Guidelines. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions. Several noise barrier scenarios have been analyzed for this Study: existing noise barriers to remain in place; existing noise barriers displaced by proposed construction to be replaced by a reconstructed barrier on a new alignment; existing noise barriers that were evaluated for extensions; and new noise barriers on new alignment. Where an existing noise barrier is displaced, a replacement barrier that meets or exceeds the noise abatement performance of the existing noise barriers to be replaced. For locations where a barrier on new alignment was studied, the proposed barrier must meet the feasibility and reasonableness criteria set forth in MDOT SHA's noise policy.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.P for a response to socioeconomic impacts and impacts to the regional economy.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>

Noise analysis follows the noise policy and guidelines as set forth by MDOT SHA in their Highway Noise Abatement Planning and Engineering Guidelines. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions. Several noise barrier scenarios have been analyzed for this Study: existing noise barriers to remain in place; existing noise barriers displaced by proposed construction to be replaced by a reconstructed barrier on a new alignment; existing noise barriers that were evaluated for extensions; and new noise barriers on new alignment. Where an existing noise barrier is displaced, a replacement barrier that meets or exceeds the noise abatement performance of the existing noise barriers to be replaced. For locations where a barrier on new alignment was studied, the proposed barrier must meet the feasibility and reasonableness criteria set forth in MDOT SHA's noise policy.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.P for a response to socioeconomic impacts and impacts to the regional economy.</p>

			Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Gestl, Russ	I-410	Refer to Appendix T Page DEIS C–620 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Gettys, Evelyn	I-812	Refer to Appendix T Page DEIS C–621 for your exact comment.	Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.
Ghazi, Reema	I-294	Refer to Appendix T Page DEIS C–622 for your exact comment.	Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.4.G for a response to climate change considerations. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Ghorayeb, Sara	I-1202	Refer to Appendix T Page DEIS C–623 for your exact comment.	Thank you for your comment concerning impacts to the Silver Spring YMCA. As described in the Supplemental DEIS, the Silver Spring YMCA is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources. Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.
Gibson, Dana	I-168	Refer to Appendix T Page DEIS C–624 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns. Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.
Gidfar, Firooz	I-1322	Refer to Appendix T Page DEIS C–625 for your exact comment.	Refer to Chapter 9, Section 3.4.L for a response to public health impacts. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.

			<p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>
Glinski, Seth	I-826	Refer to Appendix T Page DEIS C–639 for your exact comment.	<p>Thank you for your comment concerning impacts to your property and neighborhood. Since the DEIS, MDOT SHA engaged with property owners, business owners, community organizations and the general public to address concerns over property impacts. As a result of this engagement and an effort to identify and incorporate design refinements that minimize impacts, the impacts to your property and neighborhood shown in the DEIS have been significantly reduced under the Preferred Alternative. Refer to the FEIS, Appendix E. Although partial acquisition at your property will still be necessary to develop the Preferred Alternative, the impact will be limited to a “strip take” adjacent to I-495 behind the proposed noise barrier along the I-495 outer loop. The project team will continue to be available to discuss property impacts throughout the project and as the continues in final design.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>
Golden Kroner, Rachel	I-765	Refer to Appendix T Page DEIS C–640 for your exact comment.	<p>Thank you for your comment concerning impacts to Rock Creek Park. As described in the Supplemental DEIS, this resource is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Greer, Phyllis	I-1488	Refer to Appendix T Page DEIS C–657 thru 658 for your exact comment.	<p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Grigoryev, Aleksandr	I-813	Refer to Appendix T Page DEIS C–659 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p>
Grimaldi, David	I-870	Refer to Appendix T Page DEIS C–660 for your exact comment.	<p>On I-270, the Preferred Alternative consists of converting the one existing HOV lane in each direction to a High Occupancy Toll (HOT) managed lane and adding one new HOT managed lane in each direction from I-495 to north of I-370 and on the I-270 east and west spurs. Along I-270, the existing collector-distributor (C-D) lane separation from Montrose Road to I-370 would be removed as part of the proposed improvements.</p> <p>The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p>

Grodsky, Susan	I-308	Refer to Appendix T Page DEIS C–666 thru 670 for your exact comment.	<p>Thank you for your comment on the paste function. The PDFs of the project files posted on the website are protected pdfs. The pdfs can be printed but not copy and pasted. This ensures the text cannot be altered and to maintain the formatting and federal and state 508 compliance requirements.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p>

As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>
Harnik, Peter	I-829	Refer to Appendix T Page DEIS C–698 for your exact comment.	<p>Thank you for your comment on induced demand. MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>The study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p>

Harrison, Marcy	I-974	Refer to Appendix T Page DEIS C–702 thru 708 for your exact comment.	<p>Thank you for your comment regarding property impacts, construction, and environmental impacts. Regarding your comment on stormwater management (SWM), The impacts from additional impervious area within the Cabin John watershed will be mitigated through the Maryland SWM permitting process, which requires that the project meet strict water quality and quantity goals in order to maintain post development runoff as nearly as possible to pre-development runoff. Permitting requirements include controlling stormwater runoff for the 10-year storm to match existing conditions, providing water quality treatment for all new impervious area and 50% of reconstructed impervious area to match the runoff characteristics of woods in good condition. Variances can be requested for minimal increases in stormwater runoff, however, detailed hydrologic calculations will be required to show that the minimal increases will not result in downstream flooding or erosion. The FEIS will include additional details about anticipated required and provided SWM.</p> <p>Refer to Appendix T for the Evergreen Community Organization comment response for additional responses to your comments.</p>

Hatgi, Mark	I-830	Refer to Appendix T Page DEIS C–711 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Regarding your comment on tolling locals, the project is designed to serve all potential road users and therefore MDOT does not support an option that would intentionally keep local traffic off the interstate.</p> <p>The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Hausner, Tony	I-316	Refer to Appendix T Page DEIS C-713 for your exact comment.	<p>Thank you for your comment concerning impacts to the Indian Spring neighborhood. As described in the Supplemental DEIS, this neighborhood is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p>

Henderson-O'Keefe, Parrie	I-46	Refer to Appendix T Page DEIS C-732 thru 733 for your exact comment.	<p>Non-roadway transit alternatives, such as light rail and heavy rail, were analyzed as standalone alternatives as part of the Study's Preliminary Range of Alternatives and as documented in the DEIS Appendix B. It was concluded that a standalone transit alternative could not meet the need of addressing existing and long-term traffic growth on I-495 and I-270. MDOT has studied the region's transportation needs as a whole and transit options in particular have been studied in plans developed over the past few decades. In 2002, a study of I-495 considered both transit and highway improvements and it was determined that both were needed to address the significant congestion. The light rail alignment recommended from these studies advanced into construction first. In 2016, the 16 -mile Purple Line light rail, circumferential to the Capital Beltway, began construction. The I-495 and I-270 Managed Lanes Study includes highway improvements that would complement the Purple Line light rail system currently under construction. The Preferred Alternative also includes transit elements to reduce regional congestion and further supports one of several aspirational goals of the National Capital Region's long-range transportation plan by expanding the express highway network.</p> <p>A key element of this Study's Purpose and Need includes enhancing existing and planned multimodal mobility and connectivity. In furtherance of this key consideration and to address public and agency comments on the DEIS, MDOT SHA has identified opportunities to enhance transit mobility and connectivity within the Preferred Alternative including the following elements:</p> <ul style="list-style-type: none"> • Free bus transit usage of the HOT managed lanes to provide an increase in speed of travel, assurance of a reliable trip, and connection to local bus service/systems on arterials that directly connect to activity and economic centers. • Direct and indirect connections from the proposed HOT managed lanes to existing transit stations and planned Transit Oriented Development at the Shady Grove Metro (I-370), Twinbrook Metro (Wootton Parkway), Westfield Montgomery Mall Transit Center (Westlake Terrace), and Medical Center Metro (MD 187). • Regional transit improvements to enhance existing and planned transit and support new opportunities for regional transit service including bus capacity expansion at Washington Metropolitan Area Transit Authority's (WMATA) Shady Grove Metrorail Station and Park and Ride expansion at Westfield Montgomery Mall Transit Center. <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>

Herrmann, Winifred	I-977	Refer to Appendix T Page DEIS C–747 thru 749 for your exact comment.	<p>Thank you for your comment concerning traffic noise and sound barriers in the vicinity of the Fallsmead community. Currently, a noise barrier exists along southbound I-270 from the southbound ramp from MD 28, continuing along I-270 to just short of the Ramp to MD 189. Per the current design evaluated for the SDEIS, this barrier will not be impacted by the proposed improvements and will remain in place. Near the southern end a section of wall will be displaced and relocated to a new location and an extension is proposed to provide additional benefits for residential properties closer to MD 189. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, the combination of existing, replaced, and new barrier totaling 4,666 feet in length affectively reduces noise within the community and meets MDOT SHA's noise reduction requirements. No traffic noise barrier can eliminate traffic noise. Rather they are introduced to considerably reduce noise levels for people living next to highways and are most effective when closer to the highway.</p> <p>Thank you for your suggestion regarding parking towers. MDOT regularly evaluates the availability of parking facilities for carpooling and transit.</p> <p>Refer to Chapter 9, Section 3.6A for a response on opposition to managed lanes or tolling public roads.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

Hersman, Martha	I-1494	Refer to Appendix T Page DEIS C–751 for your exact comment.	<p>Thank you for your comment concerning impacts to your property and neighborhood. As described in the Supplemental DEIS, these areas are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>

Hettchen, William	I-79	Refer to Appendix T Page DEIS C–753 for your exact comment.	<p>Thank you for your comment regarding the Public-Private Partnership (P3) Agreement. The P3 and Phase 1 Solicitation process is explained in the SDEIS, Chapter 2, Section 2.5 and in Chapter 3, Section 3.3</p>

Commenter	#	Reference to Comment	Response
			<p>Regarding your comment on improvements to I-270, potential roadway or transit improvements on I-270 from north of I-370 to I-70 were not included as part of this Study. The northern section of I-270 from north of I-370 to I-70 is part of a separate, independent National Environmental Policy Act (NEPA) study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under the I-495 and I-270 Managed Lanes Study.</p> <p>As described in the Supplemental Draft Environmental Impact Statement (SDEIS) published on October 1, 2021, the Preferred Alternative is Alternative 9 - Phase 1 South and includes a two-lane, HOT managed lanes network on I-495 and I-270 (Figure 2 3). On I-495, the Preferred Alternative consists of adding two new, HOT managed lanes in each direction from the George Washington Memorial Parkway to east of MD 187. On I-270, the Preferred Alternative consists of converting the one existing HOV lane in each direction to a HOT managed lane and adding one new HOT managed lane in each direction from I-495 to north of I-370 and on the I-270 east and west spurs. Along I-270, the existing collector-distributor (C-D) lane separation from Montrose Road to I-370 would be removed as part of the proposed improvements. The managed lanes would be separated from the general purpose (GP) lanes using flexible delineators placed within a buffer. Transit buses and HOV 3+ vehicles would be allowed free passage in the managed lanes.</p> <p>The Preferred Alternative does not include improvements on I-495 east of the I-270 east spur to MD 5. However, improvements on the remainder of the interstate system may still be needed in the future. Any such improvements would advance separately, and would be subject to additional environmental studies, analysis and collaboration with the public, stakeholders and local agencies.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p>
Hilgert, Marianne	I-1457	Refer to Appendix T Page DEIS C–754 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p>

Hillman, Craig	I-1301	Refer to Appendix T Page DEIS C–756 for your exact comment.	<p>Thank you for your comment on autonomous vehicles. The expected influx of connected and autonomous vehicles (CAVs) will impact future traffic operations on all roads in Maryland, including I-495 and I-270. MDOT SHA participates in a statewide CAV working group (https://mva.maryland.gov/safety/Pages/MarylandCAV.aspx) to stay up to date on the latest research and industry projections. At this time, there are too many unknowns regarding how CAVs could affect demand and capacity to include CAVs directly in the traffic forecasts. Capacity will likely increase as vehicle spacing decreases, but the magnitude of the capacity increase is difficult to quantify based on the current research. Also, the benefits of more vehicles per lane may be offset by a potential increase in demand on the transportation network for some types of auto trips, including "mobility as a service" trips (people that can't afford their own car, but could call an autonomous vehicle for a solo trip) and "deadhead"</p>

Commenter	#	Reference to Comment	Response
			<p>trips (trips where the autonomous vehicle is empty, traveling to a parking lot or to the next pickup point). Therefore, the traffic projections for this Study apply traditional forecasting techniques, while being cognizant of the potential CAV impacts. However, it is anticipated that this project will be adaptable to accommodate CAVs because the proposed managed lanes will create a controlled environment with physical separation, new pavement, and clear delineations, features that are conducive to CAV use.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p>

Holly, Wilson	I-338	Refer to Appendix T Page DEIS C–832 for your exact comment.	<p>Thank you for your comment on construction during nighttime hours. Only allowing construction during nighttime hours would significantly extend the duration of construction for the project because there would not be enough hours at night to do the work. There are benefits to some work during the day and others at night. Allowing day time work will allow Project to optimize and complete work efficiently and with less overall affect on the public.</p> <p>During peak traffic travel times, the same number of lanes that exist today will need to be maintained during construction to avoid further congestion. As a result, there are many areas of construction along the I-270 corridor that will require the traffic lanes to shift to allow for safe demolition, excavation, and reconstruction of elements such as bridge replacements and drainage pipe installations. These permanent shifts of traffic will maintain flow throughout the corridor at acceptable operational level while facilitating the complex construction.</p>

Holt, Mark	I-415	Refer to Appendix T Page DEIS C–836 for your exact comment.	<p>Thank you for your comment on bicycle and pedestrian access in southern Prince George's County and the environmental effects of the project on Hensen Creek. As described in the Supplemental DEIS, Henson Creek is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Hoover, Barbara	I-1455	Refer to Appendix T Page DEIS C–837 thru 839 for your exact comment.	<p>Thank you for your comment on project cost, utility cost, and environmental impacts. Regarding your comment on tree impacts, forest impacts have been avoided and minimized to the greatest extent practicable during the planning phases of this project. Forest impacts have been reduced from 1497.4 acres for Alternative 9 in the DEIS to 461.85 acres for the Preferred Alternative - Alternative 9 Phase I South in the FEIS. Sensitive Species Review Area impacts were reduced from 155.0 acres for Alternative 9 in the DEIS to 44.47 acres for the Preferred Alternative - Alternative 9 Phase I South in the FEIS. Additional avoidance and minimization of impacts will occur during the final design phase. Trees will be replanted within the LOD post-construction where feasible and forest mitigation will also take place offsite to mitigate for the impacts of this project in accordance with Maryland Reforestation Law.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips.

Commenter	#	Reference to Comment	Response
			<ul style="list-style-type: none"> The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Howard, Brett	I-1188	Refer to Appendix T Page DEIS C–841 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>
Howard, Donald	I-1454	Refer to Appendix T Page DEIS C–842 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Howland, Karen	I-1453	Refer to Appendix T Page DEIS C–843 thru 844 for your exact comment.	<p>Thank you for your comment on tolling, environmental impacts, and the use of MD 200 or the Intercounty Connector (ICC). Regarding your comment on the use of the ICC, the ICC is to provide free-flow uncongested trips between Montgomery County and Prince George's County and to remove traffic from the local roadway network through Montgomery County. In the ICC Final Environmental Impact Statement, there was an alternative that would have improved I-495 instead of the ICC. However, that alternative was dropped from further consideration because it did not meet the Study's Purpose and Need of addressing congestion on the local routes in the study area, it did not connect the growth centers, and it did not connect the planned residential areas of Montgomery County with Prince George's County nor the existing development. Consequently, the overall purpose for the ICC was not to remove traffic, and thus congestion, from I-495.</p> <p>Currently, MD 200 has available capacity to accommodate additional traffic. During the typical peak hours in 2018, MD 200 carried approximately 3,600 vehicles per hour eastbound and approximately 4,200 vehicles per hour westbound. Because MD 200 is a managed tolled facility that is intended to always operate at free-flow speeds, it has a set capacity at Level of Service (LOS) D that cannot be exceeded. Therefore, the approximate capacity of MD 200 is 5,725 vehicles per hour in each direction.</p> <p>Traffic volumes on MD 200 are growing rapidly, and there will be little, or no, spare capacity by the design year of 2040. Traffic growth on MD 200 is occurring at a higher rate than regional traffic growth, which indicates that more motorists are willing to pay a toll to avoid severe congestion and delays on alternative routes. This means that there will be a limited amount of additional capacity available on MD 200 to accommodate traffic that may divert from I-495. As MD 200 is designed to maintain the free-flow LOS D conditions into the future, toll rates will need to be raised to ensure the traffic demand on the ICC does not exceed its capacity and additional traffic would divert to alternative routes.</p> <p>The ADT served on MD 200 in 2018 was more than double the ADT in 2012. The annual growth rate varies based on the time of day and the segment, but count data indicates that the annual growth rate between October 2016 and October 2018 was between three to four percent per year on the heaviest-used segments. The first segments of MD 200 that are projected to reach capacity would do so in the year 2027. By 2040, most of the segments of MD 200 will have reached capacity during the peak hours. Overall, MD 200 may be able to accommodate some additional traffic in 2040 in certain segments and during certain times of day, but it will not offset the need for capacity improvements on I-495. See Appendix B of the DEIS for more information.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>

Husar, Muja	I-416	Refer to Appendix T Page DEIS C–854 for your exact comment.	<p>Thank you for your comment concerning traffic noise for Carderock Springs community and the Carderock Springs Elementary School schoolyard. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, a new barrier is proposed to provide noise mitigation to portions of the Carderock Springs and the elementary school that are not behind an existing barrier to the east. This new barrier will be combined with a replacement barrier, which will replace the existing barrier, and is anticipated to extend from Persimmon Tree Road to Seven Locks Road. The barrier studied was 3,434 feet long and is variable height ranging from 20 to 32 feet. This barrier will be re-evaluated during the final design process by the construction team.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p>

Jackman, Patricia	I-417	Refer to Appendix T Page DEIS C-867 for your exact comment.	<p>Thank you for your comment concerning impacts to the New Carrollton area in Prince George’s County. As described in the Supplemental DEIS, Prince George’s County is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on polluted stormwater, A preliminary SWM analysis was completed for all alternatives and is documented in Chapter 2 of the DEIS and Section 2.3.2 of the SDEIS. Mitigation for stormwater is not anticipated due to the stringent permitting requirements in Maryland, which this project will have to meet. Permitting requirements include: controlling stormwater runoff for the 10-year storm to match existing conditions, providing water quality treatment for all new impervious area and 50% of reconstructed impervious area to match the runoff characteristics of woods in good condition and managing the 2-year storm during construction so that sediment is not released to local waterways. Variances can be requested for minimal increases in stormwater runoff, however, detailed hydrologic calculations will be required to show that the minimal increases will not result in downstream flooding or erosion. Given the strict permitting requirements, impacts to downstream communities are not expected.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>

Janes, Thomas	I-241	Refer to Appendix T Page DEIS C-885 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Janes, Thomas	I-318	Refer to Appendix T Page DEIS C-884 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Janes, Thomas	I-832	Refer to Appendix T Page DEIS C-883 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Janiczak, Scott	I-1182	Refer to Appendix T Page DEIS C-886 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Janssen, Nancy	I-833	Refer to Appendix T Page DEIS C-887 for your exact comment.	Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost. Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Jelen, Tom	I-233	Refer to Appendix T Page DEIS C-888 for your exact comment.	Thank you for your comment concerning impacts to Georgia Avenue, Sligo Creek, and the surrounding area. As described in the Supplemental DEIS, these [facilities and resources are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management. Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.

Johnson, Elizabeth	I-1302	Refer to Appendix T Page DEIS C–905 thru 907 for your exact comment.	<p>Thank you for your comment concerning the Purpose and Need, mitigation, and stormwater management. Environmental scientists worked for 4-years in coordination with the regulatory and resource agencies to avoid and minimize impacts to natural resources to the greatest extent practicable during preliminary design. Avoidance and Minimization of impacts to wetlands, wetland buffers, waterways, and floodplains is discussed in detail in the Avoidance, Minimization, and Impacts Report that was appended to the DEIS and will be appended to the FEIS in final form. Trees will be replanted within the LOD post-construction where feasible and forest mitigation will also take place offsite to mitigate for the impacts of this project in accordance with Maryland Reforestation Law. The Draft Compensatory Mitigation Plan was included as an appendix to the DEIS. This plan outlined the detailed mitigation site search as well as the resulting mitigation sites identified for stream and wetland restoration as 404 mitigation for the I-495 & I-270 MLS. The Final Compensatory Mitigation Plan will be appended to the FEIS and includes the Phase II mitigation plans for the selected stream and wetland mitigation sites in Maryland. Virginia has a mitigation credit program that identifies appropriate sites for wetland and stream mitigation to compensate for unavoidable impacts. Onsite stormwater management has been maximized to the greatest extent practicable within the Study Preferred Alternative LOD. The remaining stormwater treatment will be achieved offsite. The Compensatory Stormwater Mitigation Plan is appended to the SDEIS and includes a summary of the site search process and the resulting stormwater sites identified for offsite stormwater management to cover the stormwater treatment need for the Study. The Final Compensatory Stormwater Mitigation Plan will be appended to the FEIS.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Jones, C. Rick	I-164	Refer to Appendix T Page DEIS C–918 thru 925 for your exact comment.	<p>Thank you for your comment. Studies based on actual user data shows that users of all income levels benefit from reduced travel times, including managed lane users and those who continue to use the general purpose or toll-free lanes. Managed lane usage is not closely correlated to income. The managed lanes would provide more options for people needing a reliable trip time. Nationwide research shows a majority of travelers choose to use managed lanes occasionally for critical or important trips, such as reaching an appointment or a school event. Relevant recent experience with similar facilities in Virginia on I-495 and I-95 further supports this conclusion. As reported in The Washington Post in 2018: “...most 495 and 95 express lane users are not affluent...”. According to another Post report, the average toll rates for Virginia’s managed lanes on I-495 and I-95 are \$5.40 and \$8.45 per trip, respectively. Experience in Virginia on I-495 shows that 82 percent of customers spend less than \$20 a month and 85 percent of trips were less than \$12. On the Virginia I-95 Express Lanes, 74 percent of customers spend less than \$20 a month</p> <p>Regarding your comment about residential and business relocations, MDOT SHA engaged with property owners, business owners, community organizations and the general public to address concerns over property displacements and impacts. As a result of this engagement and to align the NEPA approval with the planned project phased delivery and permitting approach which focused on Phase 1 South only, the range of 25-34 full property displacements revealed in the DEIS have been completely avoided under the Preferred Alternative. In addition, no permanent impacts to the operation of existing community facilities would occur. As a result, although partial acquisitions will still be necessary to develop the Preferred Alternative (limited “strip takes” of parcels and undeveloped areas of trees or landscaping adjacent to I-495 and I-270), the existing sense of community cohesion of communities along the study corridors would not be impacted.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p>

			Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.
Jones, Kevin	I-32	Refer to Appendix T Page DEIS C–917 for your exact comment.	Refer to Chapter 9, Section 3.1 for a response on Purpose and Need. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Joseph, Stephanie	I-1273	Refer to Appendix T Page DEIS C–926 for your exact comment.	Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.
Judge, Adam	I-906	Refer to Appendix T Page DEIS C–927 for your exact comment.	Thank you for your comment on induced demand. MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing. The study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region. Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation. Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Jung, Howard	I-722	Refer to Appendix T Page DEIS C–928 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Justice, Ed	I-35	Refer to Appendix T Page DEIS C–929 for your exact comment.	Thank you for your comment concerning impacts to Walter Reed National Military Medical Center. As described in the Supplemental DEIS, this facility is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.
Kaiser, Anne	I-271	Refer to Appendix T Page DEIS C–930 for your exact comment.	Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.
Kambanis, George	I-592	Refer to Appendix T Page DEIS C–931 for your exact comment.	Thank you for your comment concerning traffic noise. The noise analysis has been updated for the FEIS, and proposed noise abatement is shown in the updated Noise Analysis Technical Report. Where impacts were identified, several sound barrier scenarios were considered: existing sound barriers to remain in place; existing sound barriers displaced by proposed construction to be replaced by a reconstructed barrier on a new alignment; existing sound barriers that were evaluated for extensions; and new sound barriers on new alignment. The noise analysis follows the noise policy and guidelines as set forth by MDOT SHA in their Highway Noise Abatement Planning and Engineering Guidelines. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions. MDOT SHA developed their Highway Noise Abatement Planning and Engineering Guidelines to provide detailed implementation guidance, critical background information, rationale, and other comprehensive criteria associated with a highway noise

Commenter	#	Reference to Comment	Response
			<p>study for Federally funded projects in the state of Maryland.</p> <p>The existing sound barrier along NB I-270, north of Tuckerman Lane, is proposed to be replaced and extended. A sound barrier was evaluated along SB I-270 for Cabin John Regional Park and does not meet the reasonableness criteria outlined in the MDOT SHA Highway Noise Abatement Planning and Engineering Guidelines. The federal regulations require MDOT SHA to assess whether abatement is “feasible and reasonable” in accordance with a series of practical engineering and performance measures. The noise abatement shown in the FEIS is recommended based on preliminary design assumptions; these recommendations will be finalized during the final design stage, when detailed engineering is performed.</p> <p>Sound barriers are designed to lower the overall traffic noise level but will not eliminate the noise entirely. The sound barrier is not intended to mitigate point source noise emissions such as air brakes, motorcycles and modified exhaust systems on vehicles and trucks. Sound travels in waves, and is dependent on ground cover, topography and atmospheric conditions as well as intervening obstacles (such as sound barriers, buildings or vegetation). Sound levels are measured on a logarithmic scale, which means that in order for there to be a barely perceptible (3 dBA) increase in noise, either traffic volume would need to double and still operate at high speeds, or the roadway would need to move significantly closer to the residence. Neither of these conditions are proposed as a result of the build alternative, so noise is not expected to become significantly louder.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>
Kanas, Theodore	I-609	Refer to Appendix T Page DEIS C–932 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Kantzer, Max	I-1445	Refer to Appendix T Page DEIS C–933 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Kaplan, Harriet	I-848	Refer to Appendix T Page DEIS C–934 thru 935 for your exact comment.	<p>Thank you for your comment concerning impacts to Blair High School, The Silver Spring YMCA, Holy Cross Hospital, Slick Creek Park, and Rock Creek Park. As described in the Supplemental DEIS, these facilities and resources are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p>

Katz, Arthur	I-1221	Refer to Appendix T Page DEIS C–951 thru 961 for your exact comment.	<p>Thank you for your extensive comments. Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a</p>

Commenter	#	Reference to Comment	Response
			<p>managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p>

Keenan, Linda	I-418	Refer to Appendix T Page DEIS C–963 for your exact comment.	<p>Thank you for your comment concerning impacts to Sligo Creek Golf Course and the surrounding area in Prince George’s County. As described in the Supplemental DEIS Prince George’s County is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on connected and autonomous vehicles (CAVs), the expected influx of CAVs will impact future traffic operations on all roads in Maryland, including I-495 and I-270. MDOT SHA participates in a statewide CAV working group (https://mva.maryland.gov/safety/Pages/MarylandCAV.aspx) to stay up to date on the latest research and industry projections. At this time, there are too many unknowns regarding how CAVs could affect demand and capacity to include CAVs directly in the traffic forecasts. Capacity will likely increase as vehicle spacing decreases, but the magnitude of the capacity increase is difficult to quantify based on the current research. Also, the benefits of more vehicles per lane may be offset by a potential increase in demand on the transportation network for some types of auto trips, including "mobility as a service" trips (people that can't afford their own car, but could call an autonomous vehicle for a solo trip) and "deadhead" trips (trips where the autonomous vehicle is empty, traveling to a parking lot or to the next pickup point). Therefore, the traffic projections for this Study apply traditional forecasting techniques, while being cognizant of the potential CAV impacts. However, it is anticipated that this project will be adaptable to accommodate CAVs because the proposed managed lanes will create a controlled environment with physical separation, new pavement, and clear delineations, features that are conducive to CAV use.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Kelley, Matt	I-1243	Refer to Appendix T Page DEIS C–965 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Kelly, Joyce	I-257	Refer to Appendix T Page DEIS C–966 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Kelly, Laurie	I-287	Refer to Appendix T Page DEIS C–967 for your exact comment.	Thank you for your comment on the 100-year floodplain. No, the 100-year flood is a statistical designation meaning that in any given year, there is a 1% chance of a flood risk in that area. It does not mean that a particular area cannot experience extensive floods more frequently than every 100-years. Some areas may experience more than one 100-year flood in a single year. This terminology is often misinterpreted. Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.
Kennedy, Douglas	I-863	Refer to Appendix T Page DEIS C–968 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.

Kessler, Daniel	I-745	Refer to Appendix T Page DEIS C-972 thru 973 for your exact comment.	<p>Thank you for your comment on environmental and utility impacts, toll lanes, and congestion. As part of this project, the design of all interchanges within the study limits have been evaluated, and interchange design changes have been incorporated where appropriate, as suggested. However, isolated design changes at interchanges and merges alone would not be expected to sufficiently relieve congestion, which is primarily caused by freeway segments exceeding capacity.</p> <p>The project also accounts for the ongoing improvements proposed along I-270 as part of the Innovative Congestion Management (ICM) project. The Managed Lanes Study is compatible with the improvements implemented under the I-270 ICM project. Most of the ICM improvement will be maintained, including ramp metering, auxiliary lane improvements in multiple locations along both directions of I-270 south of I-370, and all improvements north of I-370.</p> <p>For the area near the MD 85 interchange, potential widening in the Northern section of I-270 from I-370 to I-70 is part of a separate, independent National Environmental Policy Act (NEPA) study under the I-495 and I-270 Public-Private Partnership (P3) Program.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>

Commenter	#	Reference to Comment	Response
			Refer to Chapter 9, Section 3.4.I for a response to construction impacts.
Kock, Gabriela	I-321	Refer to Appendix T Page DEIS C–989 for your exact comment.	<p>Thank you for your comment on toll lanes and the ICC, impacts to low income communities, and air quality. The Intercounty Connector has been successful in providing the option for a free-flow trip between I-95 and I-270 and before and after studies have shown that the ICC resulted in reduced congestion on the surrounding local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p>
Koenig, Christy	I-478	Refer to Appendix T Page DEIS C–990 for your exact comment.	<p>Thank you for your comment concerning impacts to the Woodley Gardens Shopping Center. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements; therefore, no businesses would be taken due to the proposed roadway widening. Sliver impacts to properties along I-270 are proposed for elements such as roadside grading, on-site drainage and stormwater management, and noise barrier replacement/construction. These partial property acquisitions are considered ones that do not cause a business or residential relocation and have been assumed where a principle building of a residence, business, or community facility is located more than 20 feet from the Preferred Alternative limits of disturbance.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Koh, Edward	I-869	Refer to Appendix T Page DEIS C–991 for your exact comment.	Thank you for your comment concerning traffic noise. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, a new barrier is proposed to provide noise mitigation to the Rose Hill community and surrounding area. The proposed barrier is anticipated to extend from the interchange with MD 189 (Falls Road) to MD 28 (W. Montgomery Road) providing noise reduction to 44 impacted residences as well as to 44.67 non-impacted benefited residence. The odd decimal number is due to how non-residential properties, such as the school, church, nursing home, are equated to residences for purposes of analysis. This barrier will be re-evaluated during the final design process by the construction team.

			Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.
Kohli, Sandeep	I-533	Refer to Appendix T Page DEIS C–992 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Kolnik, Alan	I-1069	Refer to Appendix T Page DEIS C–993 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Thank you for your input on the existing I 270 HOV lanes.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p>
Konopka Pazan, Kristen	I-143	Refer to Appendix T Page DEIS C–994 thru 995 for your exact comment.	<p>Thank you for your comment concerning the new Gude Drive interchange. The proposed interchange at Gude Drive would provide access to and from the high-occupancy toll (HOT) managed lanes only. Ramps connecting Gude Drive with the general purpose lanes would not be provided. The current design concept includes direct access ramps connecting the HOT managed lanes with Gude Drive at a new four-leg intersection on the bridge structure that crosses over I-270. The elevation of the proposed ramps would generally not exceed the elevation of the existing Gude Drive bridge. Flyover ramps are not proposed as part of the current design concept for the Preferred Alternative.</p> <p>Regarding your comment on water pollution, this project will be required to control stormwater runoff from MDOT ROW to match existing stormwater runoff for the 10-year storm. Therefore, the total runoff will not increase to Watts Branch. In addition, the project will be required to treat all new impervious area and 50% of reconstructed impervious area (i.e. existing impervious area that is being reconstructed) to mimic the runoff characteristics of woods in good condition. The SWM concept provides full water quality required treatment for the runoff to Watts Branch near Gude Drive. Therefore, the pollution should not increase to Watts Branch.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study, including the No-Build Alternative.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>

Kosterlitz, David	I-1441	Refer to Appendix T Page DEIS C–1020 for your exact comment.	<p>Thank you for your comment regarding stream impacts. Maryland and Virginia stormwater regulations will be met by this project and these regulations protect water quality of local waterways and wetlands. The project will maximize onsite stormwater management to the extent practicable and all stormwater quantity requirements will be met onsite. The portion of the stormwater quality requirements that cannot be met onsite will be met offsite as detailed in the Compensatory Stormwater Mitigation Plan that was appended to the SDEIS and a final draft will be appended to the FEIS. State regulations require that stormwater be met within affected watersheds and this project will adhere to these regulations. The Maryland Department of the Environment will not only review this project to ensure it adheres to stormwater regulations, it will also review water quality effects of the project as part of the Water Quality Certification process.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>

Krampf, William	I-36	Refer to Appendix T Page DEIS C–1027 for your exact comment.	<p>Thank you for your comment on growth and P3 projects. The Priority Funding Areas Law, the center piece of the Maryland Smart Growth and Neighborhood Conservation act of 1997, directs state funding for growth related infrastructure to Priority Funding Areas (PFAs). Growth-related projects include most State programs that encourage growth and development such as highways, sewer and water construction, economic development assistance, and State leases or construction of new office facilities. The Smart Growth Act legislatively designated certain areas as PFAs and established criteria for locally designated PFAs. Through the Smart Growth Act, Maryland is committed to limiting sprawl development by directing funds where they can help to revitalize older neighborhoods, and redirect growth to already developed areas, saving the state’s farmland, open spaces, and natural resources (MDP, 2019). To evaluate the Study’s growth implications, consistency with MDP’s Planning Policy, and compliance with the Priority Funding Area Law, Smart Growth Coordination Checklists were prepared by MDOT SHA and are included in Appendix C of the Final Community Effects Assessment and Environmental Justice Technical Report (FEIS, Appendix F). Per an email on January 12, 2022, MDP concurs with the Priority Funding Act Law compliance for the I-495 & I-270 Managed lanes Study Preferred Alternative. Also, the authors of this Study are environmental and transportation professionals and do not include commercial entities with conflicts of interest.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>

Laskey, Michael	I-819	Refer to Appendix T Page DEIS C–1055 for your exact comment.	<p>Thank you for your comment on induced demand. MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>Our study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Leistra, Paul	I-1437	Refer to Appendix T Page DEIS C–1068 thru 1069 for your exact comment.	<p>Thank you for your comment concerning impacts to Northwest Branch. As described in the Supplemental DEIS, this resource is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p>

Leshner, Sarah	I-1525	Refer to Appendix T Page DEIS C–1076 thru 1079 for your exact comment.	<p>Thank you for your comment on public health, induced demand, COVID, project cost, and environmental impacts. MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>Our study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region.</p> <p>Regarding your comment on hazardous waste, since the publication of the DEIS, a detailed review of the potential for hazardous materials and contaminate mobilization during construction for the Preferred Alternative was conducted for the SDEIS. Prior to acquisition of right-of-way and construction, Preliminary Site Investigations (PSIs) would be conducted to further investigate properties within and in the vicinity of the Preferred Alternative LOD that have a high potential for mitigation contaminated materials exposed during construction activities (refer to Section 5.10 of the FEIS for additional details). Proposed investigation for the high concern sites should adequately characterize surficial and subsurface soils, as well as groundwater, if anticipated to be encountered. Example locations would consider locations of previous releases, former/current/abandoned storage tanks, and inferred groundwater flow, as well as proposed soil/groundwater disturbance during</p>

Commenter	#	Reference to Comment	Response
			<p>construction. The Developer would be required to use best management practices to minimize the release of any hazardous materials during construction.</p> <p>Regarding your comment about the Konterra mitigation site proposed as potential mitigation in the DEIS. As you noted in your comments, portions of the Konterra properties were purchased during the ICC project, however significant land holdings remained following purchase. The Konterra mitigation site proposed in the DEIS is located on privately owned lands, not on MDOT SHA property. While this site was considered a potential mitigation site for the DEIS alternatives, the site is no longer under consideration for the Preferred Alternative.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p>
Lester, Molly	I-1526	Refer to Appendix T Page DEIS C–1080 thru 1081 for your exact comment.	<p>Thank you for your comment concerning impacts to the Greenbelt Historic District. As described in the Supplemental DEIS, Greenbelt is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>
LeVee, William and Cheryl	I-743	Refer to Appendix T Page DEIS C–1082 for your exact comment.	<p>Thank you for your comment concerning impacts to your property and the New Mark Commons community. The Preferred Alternative limits of disturbance, as shown in Appendix D of the SDEIS, include the I-270 interchange at MD 189 (Exit 5). The interchange would be modified and the existing ramps would be adjusted to accommodate the mainline widening of I-270. The Preferred Alternative limits of disturbance along the south side of MD 189 east of I-270 stay within existing right-of-way.</p>

Lipp, Shannon	I-500	Refer to Appendix T Page DEIS C–1106 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Lipsy, Rachel	I-1464	Refer to Appendix T Page DEIS C–1107 thru 1109 for your exact comment.	<p>Thank you for your comment. Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p>

Commenter	#	Reference to Comment	Response
			<p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Appendix T for the Forest Estates Community Association comment response for additional responses to your comments.</p>

Commenter	#	Reference to Comment	Response
Longo, Nancy	I-853	Refer to Appendix T Page DEIS C–1120 thru 1121 for your exact comment.	<p>Thank you for your comment concerning traffic congestion on arterial roads. As noted in Section 3.3.6 of the DEIS, the net impact of the project will be an overall reduction in delay on the surrounding arterials such as Connecticut Avenue, despite some localized increases in arterial traffic near the managed lane access interchanges. The portions of the local road network with an anticipated increase in volumes are being evaluated in more detail as part of the FEIS, and mitigation will be proposed where needed to maintain acceptable operations per FHWA Interstate Access Point Approval guidelines.</p> <p>That being said, the Preferred Alternative includes no action or no improvements at this time on I-495 east of the I-270 spur to MD 5 in Prince George's County. See Figure 1-1 in the Supplemental DEIS on pg. 1-2. The potential impacts raised in your comment had been identified in the DEIS related to build alternatives that would have spanned the entire study area. However, widening adjacent to Connecticut Avenue is no longer included in this project. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>While a separate origin/destination study was not conducted, the project team reviewed origin/destination data, which was used to develop forecasts and assist in model calibration.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>

Magary, Garine	I-70	Refer to Appendix T Page DEIS C–1141 for your exact comment.	<p>Thank you for your comment concerning traffic noise. Under the Preferred Alternative there are 59 noise sensitive areas (NSA) along the study corridors. Within these NSA's, several noise barrier scenarios were considered: existing noise barriers to remain in place; existing noise barriers displaced by proposed construction to be replaced by a reconstructed barrier on a new alignment; existing noise barriers that were evaluated for extensions; and new noise barriers on new alignment. For this analysis, noise barriers that are anticipated to be displaced for roadway improvements or stormwater management conflicts, have been analyzed to verify that there is no decrease in performance as replacement barriers. Any barriers that are displaced, will be re-evaluated during the final design process to verify that replacement noise barriers meet or exceed the noise abatement performance of the existing noise barriers to be replaced. For additional details refer to FEIS, Chapter 5, Section 5.9 and FEIS, Appendix L, the Final Noise Analysis Report.</p> <p>Regarding your comment on water management, stormwater management will account for the National Oceanic and Atmospheric Administration (NOAA) Atlas 14 average rainfalls for the area. The land use change from pervious area to impervious area will be accounted for and the increased stormwater runoff will be managed to match or be below the existing stormwater runoff for the 10-year storm. The stormwater will be managed by using stormwater facilities, such as, detention ponds, underground vaults, bioretentions, submerged gravel wetlands, etc.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic, including impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Magary, Garine	I-339	Refer to Appendix T Page DEIS C–1138 for your exact comment.	<p>Thank you for your comment. Noise analysis for a project such as proposed for I-495 and I-270 is required as part of the National Environmental Policy Act (NEPA) of 1969 and the Federal-Aid Highway Act of 1970. MDOT SHA developed their Highway Noise Abatement Planning and Engineering Guidelines to provide detailed implementation guidance, critical background information, rationale, and other comprehensive criteria associated with a highway noise study for Federally funded projects in the state of Maryland. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions. As such, a noise analysis was completed in support of the Supplemental DEIS. The conclusions of the noise analysis are as described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum. Noise mitigation that is found to be both feasible and reasonable will be recommended for further analysis in the design stages of the project.</p>

Commenter	#	Reference to Comment	Response
			<p>Regarding your comment on water management, Stormwater management will account for the National Oceanic and Atmospheric Administration (NOAA) Atlas 14 average rainfalls for the area. The land use change from previous area to impervious area will be accounted for and the increased stormwater runoff will be managed to match or be below the existing stormwater runoff for the 10-year storm. The stormwater will be managed by using stormwater facilities, such as, detention ponds, underground vaults, bioretentions, submerged gravel wetlands, etc.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>
Magary, Garine	I-340	Refer to Appendix T Page DEIS C–1140 for your exact comment.	<p>Thank you for your comment concerning impacts to historic properties. MDOT SHA is in compliance with Section 106 of the National Historic Preservation Act and developing a Programmatic Agreement that identifies on going identification, avoidance, minimization and mitigation of historic properties. Adverse effects to historic properties are not the same as destruction and generally involve some diminishment of aspects of the properties which will be mitigated.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>
Magin, Elizabeth	I-1434	Refer to Appendix T Page DEIS C–1144 for your exact comment.	<p>Thank you for your comment concerning impacts to Rock Creek Park, Sligo Creek Park, and Greenbelt park. As described in the Supplemental DEIS, these resources are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>

Malone, Elizabeth L	I-190	Refer to Appendix T Page DEIS C–1151 thru 1153 for your exact comment.	<p>Thank you for your comments. MDOT SHA recognizes that no one solution can address the many transportation needs of the region. The MDOT seeks to address these needs through a variety of measures. This Study is one of the many transportation initiatives in the region. With regard to your comment concerning local network traffic. As noted in Section 3.3.6 of the DEIS, the net impact of the project will be an overall reduction in delay on the surrounding arterials, despite some localized increases in arterial traffic near the managed lane access interchanges. The portions of the local road network with an anticipated increase in volumes has been evaluated in more detail as part of the FEIS, and mitigation is proposed where needed to maintain acceptable operations per FHWA Interstate Access Point Approval guidelines.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study, including the No-Build Alternative.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Manale, Andrew	I-1432	Refer to Appendix T Page DEIS C–1154 for your exact comment.	<p>Thank you for your comment concerning traffic and the use of MD 200 or the Intercounty Connector (ICC). The purpose of MD 200 or the Intercounty Connector (ICC) is to provide free-flow uncongested trips between Montgomery County and Prince George's County and to remove traffic from the local roadway network through Montgomery County. In the ICC Final Environmental Impact Statement, there was an alternative that would have improved I-495 instead of the ICC. However, that alternative was dropped from further consideration because it did not meet the Study's Purpose and Need of addressing congestion on the local routes in the study area, it did not connect the growth centers, and it did not connect the planned residential areas of Montgomery County with Prince George's County nor the existing development. Consequently, the overall purpose for the ICC was not to remove traffic, and thus congestion, from I-495.</p> <p>Currently, MD 200 has available capacity to accommodate additional traffic. During the typical peak hours in 2018, MD 200 carried approximately 3,600 vehicles per hour eastbound and approximately 4,200 vehicles per hour westbound. Because MD 200 is a managed tolled facility that is intended to always operate at free-flow speeds, it has a set capacity at Level of Service (LOS) D that cannot be exceeded. Therefore, the approximate capacity of MD 200 is 5,725 vehicles per hour in each direction.</p> <p>Traffic volumes on MD 200 are growing rapidly, and there will be little, or no, spare capacity by the design year of 2040. Traffic growth on MD 200 is occurring at a higher rate than regional traffic growth, which indicates that more motorists are willing to pay a toll to avoid severe congestion and delays on alternative routes. This means that there will be a limited amount of additional capacity available on MD 200 to accommodate traffic that may divert from I-495. As MD 200 is designed to maintain the free-flow LOS D conditions into the future, toll rates will need to be raised to ensure the traffic demand on the ICC does not exceed its capacity and additional traffic would divert to alternative routes.</p> <p>The ADT served on MD 200 in 2018 was more than double the ADT in 2012. The annual growth rate varies based on the time of day and the segment, but count data indicates that the annual growth rate between October 2016 and October 2018 was between three to four percent per year on the heaviest-used segments. The first segments of MD 200 that are projected to reach capacity would do so in the year 2027. By 2040, most of the segments of MD 200 will have reached capacity during the peak hours.</p> <p>Overall, MD 200 may be able to accommodate some additional traffic in 2040 in certain segments and during certain times of day, but it will not offset the need for capacity improvements on I-495. See Appendix B of the DEIS for more information.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>

Mann, Juli	I-1430	Refer to Appendix T Page DEIS C–1158 thru 1159 for your exact comment.	<p>Thank you for your comment concerning impacts to your property on Sutherland Road in Silver Spring. As described in the Supplemental DEIS, this property is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose</p>

Commenter	#	Reference to Comment	Response
			<p>lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

Marcin, Daniel	I-204	Refer to Appendix T Page DEIS C–1164 for your exact comment.	<p>Thank you for your comment on tolling existing I-495 and I-270 lanes. Under Title 23 of the U.S. Code (Highways), there is a long-standing general prohibition on the imposition of tolls on Federal-aid highways; however, Title 23 and other statutes have carved out certain exceptions to this general prohibition through special programs. These programs allow tolling to generate revenue to support highway construction activities and/or enable the use of road pricing for congestion management. If Federal funds have been used or will be used on the highway, then the public authority responsible for the facility must qualify for toll authority under one of these Federal toll programs. Within these programs, there are two that have been specially authorized by Congress on a pilot basis in various highway authorization acts since 1991. Participation in these programs is limited to a set number of slots that have been authorized for each program. Project sponsors are also required to submit an application and to execute a toll agreement with FHWA to receive authorization to impose tolls under these programs.</p> <p>The Interstate System Reconstruction And Rehabilitation Pilot Program (ISRRPP) allows the conversion of a facility on the Interstate System into a toll facility in conjunction with needed reconstruction or rehabilitation that is only possible with the collection of tolls. Congress has authorized up to three slots in the program, which must be used for projects in different States. The Value Pricing Pilot Program (VPPP) is an experimental program that is designed to assess the potential of different value pricing approaches for reducing congestion. Under this program, tolls may be imposed on existing toll-free highways, bridges, and tunnels, so long as variable pricing is used to manage demand. Congress has authorized up to 15 slots under the VPPP, which are allocated to State or local agencies.</p> <p>While Title 23 does not preclude tolling existing interstates, tolling all the I-495 & I-270 existing lanes would not adequately address the need for a long-term solution to regional congestion. Even if tolled, the existing lanes would not be able to accommodate demand, which would still result in a breakdown of traffic flow on the facilities. Tolling all the lanes would also not provide reasonable and equitable options for drivers who are not willing or able to pay a toll, resulting in more traffic on local arterial roads, which are not able to handle additional traffic. The combination of dynamically priced lanes and free general-purpose lanes allows MDOT to better manage these highly congested facilities and improve travel speeds and reduce delay for all drivers.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p>

Within these programs, there are two that have been specially authorized by Congress on a pilot basis in various highway authorization acts since 1991. Participation in these programs is limited to a set number of slots that have been authorized for each program. Project sponsors are also required to submit an application and to execute a toll agreement with FHWA to receive authorization to impose tolls under these programs.</p> <p>The INTERSTATE SYSTEM RECONSTRUCTION AND REHABILITATION PILOT PROGRAM (ISRPP) allows the conversion of a facility on the Interstate System into a toll facility in conjunction with needed reconstruction or rehabilitation that is only possible with the collection of tolls. Congress has authorized up to three slots in the program, which must be used for projects in different States. The VALUE PRICING PILOT PROGRAM (VPPP) is an experimental program that is designed to assess the potential of different value pricing approaches for reducing congestion. Under this program, tolls may be imposed on existing toll-free highways, bridges, and tunnels, so long as variable pricing is used to manage demand. Congress has authorized up to 15 slots under the VPPP, which are allocated to State or local agencies.</p> <p>While Title 23 does not preclude tolling existing interstates, tolling all the I-495 & I-270 existing lanes would not adequately address the need for a long-term solution to regional congestion. Even if tolled, the existing lanes would not be able to accommodate demand, which would still result in a breakdown of traffic flow on the facilities. Tolling all the lanes would also not provide reasonable and equitable options for drivers who are not willing or able to pay a toll, resulting in more traffic on local arterial roads, which are not able to handle additional traffic. The combination of dynamically priced lanes and free general-purpose lanes allows MDOT to better manage these highly congested facilities and improve travel speeds and reduce delay for all drivers.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Marcin, Daniel	I-855	Refer to Appendix T Page DEIS C–1166 for your exact comment.	<p>Thank you for your comment concerning toll roads. Under Title 23 of the U.S. Code (Highways), there are long-standing regulations restricting the imposition of tolls on Federal-aid highways; however, Title 23 and other statutes have carved out certain exceptions through special programs. These programs allow tolling to generate revenue to support highway construction activities and/or enable the use of road pricing for congestion management. If Federal funds have been used or will be used on the highway, then the public authority responsible for the facility must qualify for toll authority under one of these Federal toll programs. Within these programs, there are two that have been specially authorized by Congress on a pilot basis in various highway authorization acts since 1991. Participation in these programs is limited to a set number of slots that have been authorized for each program. Project sponsors are also required to submit an application and to execute a toll agreement with FHWA to receive authorization to impose tolls under these programs.</p> <p>The INTERSTATE SYSTEM RECONSTRUCTION AND REHABILITATION PILOT PROGRAM allows the conversion of a facility on the Interstate System into a toll facility in conjunction with needed reconstruction or rehabilitation that is only possible with the collection of tolls. Congress has authorized up to three slots in the program, which must be used for projects in different States. The VALUE PRICING PILOT PROGRAM (VPPP) is an experimental program that is designed to assess the potential of different value pricing approaches for reducing congestion. Under this program, tolls may be imposed on existing toll-free highways, bridges, and tunnels, so long as variable pricing is used to manage demand. Congress has authorized up to 15 slots under the VPPP, which are allocated to various State or local agencies.</p> <p>While Title 23 does not preclude tolling existing interstates, tolling all the I-495 & I-270 existing lanes would not adequately address the need for a long-term solution nor provide the emergency evacuation option accommodated by the Preferred Alternative. Even if tolled, the existing lanes would not be able to accommodate demand, which would still result in a breakdown of traffic flow on the facilities and local roads. Tolling all the lanes would not provide options for drivers who are not willing or able to pay a toll, resulting in more traffic on local arterial roads. The combination of dynamically priced lanes and free general-purpose lanes allows MDOT to better manage these highly congested facilities, provide options to improve travel speeds, while also, as you note, encouraging carpooling and transit.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Markert, David	I-1428	Refer to Appendix T Page DEIS C–1175 for your exact comment.	<p>Thank you for your comment concerning impacts to the Old Farm Community. There is an existing sound barrier located along NB I-270 between Tuckerman Lane and Montrose Road that is proposed to be partially replaced and extended as part of this project. Sound barriers are designed to lower the overall traffic noise level but will not eliminate the noise entirely. The sound barrier is not intended to mitigate point source noise emissions such as air brakes, motorcycles and modified exhaust systems on vehicles and trucks. Sound travels in waves, and is dependent on ground cover, topography and atmospheric conditions as well as intervening obstacles (such as sound barriers, buildings or vegetation). Sound levels are measured on a logarithmic scale, which means that in order for there to be a barely perceptible (3 dBA) increase in noise, either traffic volume would need to double and still operate at high speeds, or the roadway would need to move significantly closer to the residence. Neither of these conditions are proposed as a result of the build alternative, so noise is not expected to become significantly louder.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and teleworking.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Marks, Benjamin	I-502	Refer to Appendix T Page DEIS C–1178 for your exact comment.	<p>Thank you for your comment concerning the need for a noise barrier just north of exit 6. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, a new barrier is proposed to provide noise mitigation to the West End Park community. The barrier is proposed to begin along the Ramp from westbound MD 28, continue along the ramp and along I-270 and tying into, or behind, the existing barrier that begins just north of the Woodley Gardens commercial and shopping center. This existing barrier is not anticipated to be displaced until it is closer to Gude Drive. The combination of existing, replaced and new barrier totals approximately 5,952 feet in length with an average of 22 feet tall. As more detailed design progresses for this project during the final design process, this barrier will be re-evaluated by the construction team.</p>

			<p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>
<p>Martinich, Jeremy</p>	<p>I-585</p>	<p>Refer to Appendix T Page DEIS C–1182 for your exact comment.</p>	<p>Thank you for your comment. Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

McGaughy, Robert	I-1126	Refer to Appendix T Page DEIS C–1208 for your exact comment.	<p>Thank you for your comment concerning the purpose of the project, mass transit, and induced demand. Regarding your comment on induced demand, MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>Our study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

McGilvray, Laurie	I-1465	Refer to Appendix T Page DEIS C–1210 thru 1213 for your exact comment.	<p>Thank you for your comment concerning traffic and the use of MD 200 or the Intercounty Connector (ICC). The purpose of MD 200 or the Intercounty Connector (ICC) is to provide free-flow uncongested trips between Montgomery County and Prince George's County and to remove traffic from the local roadway network through Montgomery County. In the ICC Final Environmental Impact Statement, there was an alternative that would have improved I-495 instead of the ICC. However, that alternative was dropped from further consideration because it did not meet the Study's Purpose and Need of addressing congestion on the local routes in the study area, it did not connect the growth centers, and it did not connect the planned residential areas of Montgomery County with Prince George's County nor the existing development. Consequently, the overall purpose for the ICC was not to remove traffic, and thus congestion, from I-495.</p> <p>Currently, MD 200 has available capacity to accommodate additional traffic. During the typical peak hours in 2018, MD 200 carried approximately 3,600 vehicles per hour eastbound and approximately 4,200 vehicles per hour westbound. Because MD 200 is a managed tolled facility that is intended to always operate at free-flow speeds, it has a set capacity at Level of Service (LOS) D that cannot be exceeded. Therefore, the approximate capacity of MD 200 is 5,725 vehicles per hour in each direction.</p> <p>Traffic volumes on MD 200 are growing rapidly, and there will be little, or no, spare capacity by the design year of 2040. Traffic growth on MD 200 is occurring at a higher rate than regional traffic growth, which indicates that more motorists are willing to pay a toll to avoid severe congestion and delays on alternative routes. This means that there will be a limited amount of additional capacity available on MD 200 to accommodate traffic that may divert from I-495. As MD 200 is designed to maintain the free-flow LOS D conditions into the future, toll rates will need to be raised to ensure the traffic demand on the ICC does not exceed its capacity and additional traffic would divert to alternative routes.</p> <p>The ADT served on MD 200 in 2018 was more than double the ADT in 2012. The annual growth rate varies based on the time of day and the segment, but count data indicates that the annual growth rate between October 2016 and October 2018 was between three to four percent per year on the heaviest-used segments. The first segments of MD 200 that are projected to reach capacity would do so in the year 2027. By 2040, most of the segments of MD 200 will have reached capacity during the peak hours.</p> <p>Overall, MD 200 may be able to accommodate some additional traffic in 2040 in certain segments and during certain times of day, but it will not offset the need for capacity improvements on I-495. See Appendix B of the DEIS for more information.</p> <p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency</p>

			<p>comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>
McGuire, Jerry	I-389	Refer to Appendix T Page DEIS C–1214 for your exact comment.	Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
McLane, Craig	I-865	Refer to Appendix T Page DEIS C–1215 thru 1216 for your exact comment.	<p>Thank you for your comment concerning traffic noise and sound barriers in the New Carrollton area. As described in the Supplemental DEIS, the Preferred Alternative was identified after coordination with resource agencies, the public, and stakeholders to respond directly to feedback received on the DEIS to avoid displacements and impacts to significant environmental resources, and to align the NEPA approval with the planned project phased delivery and permitting approach which focused on Phase 1 South only. The Preferred Alternative includes two new, high-occupancy toll (HOT) managed lanes on I-495 in each direction from the George Washington Memorial Parkway to east of MD 187 and conversion of the one existing high-occupancy vehicle lane in each direction on I-270 to a HOT managed lane and adding one new HOT managed lane in each direction on I-270 from I-495 to north of I-370 and on the I-270 east and west spurs. The Preferred Alternative includes no action or no improvements at this time on I-495 east of the I-270 spur to MD 5 in Prince George's County. See Figure 1-1 in the Supplemental DEIS on pg. 1-2. The potential impacts raised in your comment had been identified in the DEIS related to build alternatives that would have spanned the entire study area. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>The noise analysis follows the noise policy and guidelines as set forth by MDOT SHA in their Highway Noise Abatement Planning and Engineering Guidelines. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions.</p> <p>MDOT SHA developed their Highway Noise Abatement Planning and Engineering Guidelines to provide detailed implementation guidance, critical background information, rationale, and other comprehensive criteria associated with a highway noise study for Federally funded projects in the state of Maryland. To determine noise levels, MDOT SHA uses the FHWA Traffic Noise Model (TNM). TNM was developed under the guidance of the US Department of Transportation's John A. Volpe National Transportation Systems Center and is three-dimensional representation of the proposed design year roadways and the topography of adjacent noise sensitive areas. The model incorporates vehicle noise emission levels updated for modern vehicle classification, traffic speed and traffic volume, sound propagation factors from atmospheric absorption, divergence, intervening ground, intervening barriers, and intervening rows of buildings and areas of heavy vegetation. The model was the</p>

Commenter	#	Reference to Comment	Response
			<p>culmination of six years of extensive research and incorporated state-of-the-art acoustical algorithms. Its components are supported by a scientifically founded and experimentally calibrated acoustic computation methodology with a data base made up of over 6000 individual vehicle pass-by events measured at forty sites across the country, and which is the primary building block around which the acoustic algorithms are structured. Per FHWA and MDOT SHA requirements, traffic noise is studied for the worst hour of the day. Specifically for this study, noise engineers coordinated with traffic engineers to ascertain the traffic flow and mix that generates this worst noise hour.</p> <p>On roadways such as I-95/I-495, the worst hourly noise level typically occurs at a time when truck volumes and vehicle speeds are the greatest and when traffic is free flowing. In congested corridors, such as found within this project, this is typically a period approaching or following the peak travel hours, when congestion breaks, and vehicles travel at posted speeds or greater.</p> <p>Sound barriers are designed to lower the overall traffic noise level but will not eliminate the noise entirely. The sound barrier is not intended to mitigate point source noise emissions such as air brakes, motorcycles and modified exhaust systems on vehicles and trucks. The height of a sound barrier is determined through a rigorous optimization process that factors the ability to achieve a significant reduction in sound while meeting the cost-effectiveness requirements set forth in MDOT SHA's noise policy. Assessing the effect of parallel barrier degradation due to reflective sound is completed when the ratio of the horizontal width between barriers versus the height of the barriers is less than 10 to 1, and the results of the analysis will determine whether absorptive treatment is recommended. When the ratio is greater than 10:1, there is no perceptible degradation in barrier effectiveness.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p>

Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.
Mehring, Richard	I-395	Refer to Appendix T Page DEIS C–1222 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Mekler, Samantha	I-744	Refer to Appendix T Page DEIS C–1223 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.
Melo-Correa, Alvaro	I-714	Refer to Appendix T Page DEIS C–1224 for your exact comment.	Thank you for your comment concerning impacts to your property. The Preferred Alternative, as described in the Supplemental DEIS, FEIS, and shown in Appendix E of the FEIS, does not result in any full acquisitions or residential or business displacements; therefore, no homes would be taken due to the proposed roadway widening. The Preferred Alternative limits of disturbance and proposed improvements stay within existing right-of-way at your property; therefore, there are no property impacts or acquisition required in your neighborhood. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Meltzer, Marcy	I-843	Refer to Appendix T Page DEIS C–1225 for your exact comment.	Thank you for your comment on the I-270 Pre NEPA study. The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.

Miller, Scott	I-872	Refer to Appendix T Page DEIS C–1253 for your exact comment.	Thank you for your comment on the I-270 Pre NEPA study. The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge. Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.

Commenter	#	Reference to Comment	Response
Miller, Scott	I-1308	Refer to Appendix T Page DEIS C–1254 thru 1255 for your exact comment.	<p>Thank you for your comment on impacts to Plummers Island and Rock Run. As described in Chapter 2 of the Supplemental DEIS, the Preferred Alternative includes the full replacement of the ALB on I-495 spanning the Potomac River with a new, wider bridge on the existing centerline. Comments on the Build Alternatives presented in the DEIS reflected a common support for advancing replacement of the ALB. With its location over the Potomac River and adjacent to several federally-owned parks, MDOT SHA created a separate group (the ALB Strike Team) whose mission was to investigate alternative bridge designs and construction techniques that could be employed to reduce, minimize, and avoid impacts to water and parkland resources in and around the ALB. The results of the effort are reflected in the Preferred Alternative and are the result of the coordination with key agency and public stakeholders, including NPS, M-NCPPC, USACE, MDE, and Maryland DNR.</p> <p>The National Park Service properties that border the Potomac River at the ALB include the George Washington Memorial Parkway, the Chesapeake and Ohio Canal National Historic Park (including the Chesapeake and Ohio Canal Towpath and Plummer's Island), and Clara Barton Parkway. In addition to these sensitive properties, there are also many construction challenges associated with replacement of the ALB, such as access constraints.</p> <p>A number of bridge types and construction methods (both standard and innovative) were evaluated during the Strike Team's analysis. A westward/upstream shift of the bridge alignment and additional phases of construction were also evaluated for the different bridge options. These options were presented to the stakeholders and a conventional structure was recommended that remained on the existing bridge centerline. Impacts to Plummer's Island were significantly reduced compared to those presented for the Build Alternatives in the DEIS by strategically locating the proposed piers for the replacement bridge and eliminating construction access from the island. In addition to a reduction of total impacts at the bridge construction site, the Strike Team effort resulted in a reduction of the number of construction access locations from all four quadrants, as noted in the DEIS, to the northwest quadrant only, due to its grade and proximity to a nearby roadway. This change substantially minimized impacts to the surrounding land.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>
Miller, Shelley	I-1363	Refer to Appendix T Page DEIS C–1256 thru 1259 for your exact comment.	<p>Thank you for your comment regarding COVID-19 traffic conditions, support for transit, environmental impacts, and Widening I-270 north of Germantown. Miller, Wendy	I-107	Refer to Appendix T Page DEIS C–1262 for your exact comment.	<p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>
Miller, Wendy	I-76	Refer to Appendix T Page DEIS C–1260 thru 1261 for your exact comment.	<p>Thank you for your comment concerning the National Environmental Policy Act (NEPA) process. A Preferred Alternative is not required to be identified in a Draft Environmental Impact Statement (DEIS) if the lead federal agency has not identified a Preferred Alternative at the DEIS stage (40 CFR 1502.14(e)). In the case of the I-495 and I-270 Managed Lanes Study, a Preferred alternative had not been identified at the DEIS stage. The DEIS Chapter 2, and DEIS Appendix A presented the alternatives development and screening process and stated that a Preferred Alternative would be identified in the FEIS.</p> <p>Governor Hogan and the Lead Agencies have been dedicated to the NEPA process and after reviewing the DEIS comments, a Recommended Preferred Alternative: Alternative 9 – Phase 1 South was identified. On October 1, 2021 a Supplemental Draft Environmental Impact Statement (SDEIS) for the Study was published. The SDEIS focused on new information related to the Preferred Alternative for the Managed Lanes Study. Building off the analysis in the existing DEIS, the SDEIS disclosed new information relevant to the Preferred Alternative focusing on new information while referencing the DEIS for information that remains valid. The SDEIS also described the background and context in which the Preferred Alternative, Alternative 9 - Phase 1 South was identified, as well as how the Covid-19 Pandemic impacted the Study. The SDEIS was available for the public to review and comment on the Preferred Alternative during a 45-day comment period. Following the comment period of the SDEIS, FHWA and the MDOT SHA considered comments received and respond to substantive comments on the DEIS and SDEIS in the Final Environmental Impact Statement (FEIS).</p> <p>The discussion on Alternative 5 can be found in DEIS, Chapter 2, Section 2.5.3.a as well as DEIS Appendix B. Alternative 5 consisted of adding one HOT managed lane in each direction on I-495 and converting the one existing HOV lane in each direction to a HOT managed lane on I-270. Based on additional analysis, FHWA and MDOT SHA found that Alternative 5 would fail in certain aspects and in others would perform so poorly in addressing the Study's Purpose and Need that it was not a reasonable or feasible alternative. During the alternatives screening process, Alternative 5 was rated "low" for system-wide delay, travel time index in the general purpose lanes, density, LOS, and vehicle-throughput. In addition, Alternative 5 was determined to not be financially viable. However, Alternative 5 was evaluated to the same level as other Alternatives Retained for Detailed Study (ARDS) and is included in the DEIS as a useful means of comparison to the Build and No Build Alternatives. As Alternative 5 would have some reduction in environmental impacts, a full comparison addresses agency and public comments to better understand the potential differences between a one-lane and two-lane alternative.</p> <p>Additionally, slow-moving vehicles on a one-lane facility could cause slower speeds for vehicles traveling behind them. In practice, single-lane systems are estimated to</p>

Commenter	#	Reference to Comment	Response
			<p>perform even worse than VISSIM simulation models indicate, particularly for congestion and reliability metrics, because the models do not capture the impacts of these slow-moving vehicles. Therefore, the traffic results for corridor travel time and speeds, as well as TTI, may slightly overestimate the benefits of a one-lane HOT/ETL, such as Alternative 5, compared to the No Build condition.</p> <p>Regarding your comment about evaluation of Alternative 5, in addition to failing to adequately meet the Study's Purpose and Need, Alternative 5 would not be considered a practicable alternative in the context of the US Army Corps of Engineers' permitting requirements. This conclusion is based on an accumulation of factors including, but not limited to, the minimal likelihood of Alternative 5 being financially viable, the marginal difference in resource impacts between building a one-lane and two-lane facility, and the estimated relative high cost of building a one-lane facility.</p> <p>Regarding the concern about security implications of financing the highway around the nation's capital, MDOT SHA would maintain ownership of all of the lanes (general purpose and managed lanes). The developer would design, construct, finance, maintain, and operate the new managed lanes for a contractual duration of 50 years. Since the time of the DEIS, MDOT received several bids in its procurement process and the current Selected Proposer has confirmed the financial viability of the project.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

Mittelstadt, Jonah	I-867	Refer to Appendix T Page DEIS C–1280 for your exact comment.	<p>Thank you for your comment concerning the Intercounty Connector (ICC). The purpose of MD 200 or the ICC is to provide free-flow uncongested trips between Montgomery County and Prince George's County and to remove traffic from the local roadway network through Montgomery County. In the ICC Final Environmental Impact Statement, there was an alternative that would have improved I-495 instead of the ICC. However, that alternative was dropped from further consideration because it did not meet the Study's Purpose and Need of addressing congestion on the local routes in the study area, it did not connect the growth centers, and it did not connect the planned residential areas of Montgomery County with Prince George's County nor the existing development. Consequently, the overall purpose for the ICC was not to remove traffic, and thus congestion, from I-495.</p> <p>Currently, MD 200 has available capacity to accommodate additional traffic. During the typical peak hours in 2018, MD 200 carried approximately 3,600 vehicles per hour eastbound and approximately 4,200 vehicles per hour westbound. Because MD 200 is a managed tolled facility that is intended to always operate at free-flow speeds, it has a set capacity at Level of Service (LOS) D that cannot be exceeded. Therefore, the approximate capacity of MD 200 is 5,725 vehicles per hour in each direction.</p> <p>Traffic volumes on MD 200 are growing rapidly, and there will be little, or no, spare capacity by the design year of 2040. Traffic growth on MD 200 is occurring at a higher rate than regional traffic growth, which indicates that more motorists are willing to pay a toll to avoid severe congestion and delays on alternative routes. This means that there will be a limited amount of additional capacity available on MD 200 to accommodate traffic that may divert from I-495. As MD 200 is designed to maintain the free-flow LOS D conditions into the future, toll rates will need to be raised to ensure the traffic demand on the ICC does not exceed its capacity and additional traffic would divert to alternative routes.</p> <p>The ADT served on MD 200 in 2018 was more than double the ADT in 2012. The annual growth rate varies based on the time of day and the segment, but count data indicates that the annual growth rate between October 2016 and October 2018 was between three to four percent per year on the heaviest-used segments. The first segments of MD 200 that are projected to reach capacity would do so in the year 2027. By 2040, most of the segments of MD 200 will have reached capacity during the peak hours. Overall, MD 200 may be able to accommodate some additional traffic in 2040 in certain segments and during certain times of day, but it will not offset the need for capacity improvements on I-495.</p> <p>See Appendix B of the DEIS for more information.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Moats, Sue	I-1	Refer to Appendix T Page DEIS C–1281 for your exact comment.	<p>Thank you for your comment concerning impacts to Indian Spring Terrace Park, the Silver Spring YMCA, Montgomery Blair High School, Holy Cross Hospital, Sligo Creek Golf Course, and Montgomery County Fire and Rescue on University Boulevard. Mondor, Raymond	I-215	Refer to Appendix T Page DEIS C–1287 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>
Montemarano, Arlene	I-194	Refer to Appendix T Page DEIS C–1295 thru 1297 for your exact comment.	<p>Thank you for your comment concerning impacts to archaeological sites in the Chesapeake and Ohio Canal National Historical Park. MDOT SHA is in compliance with Section 106 of the National Historic Preservation Act and developing a Programmatic Agreement that identifies ongoing identification, avoidance, minimization and mitigation of historic properties, including those archaeological sites in the Chesapeake and Ohio Canal National Historical Park. Adverse effects to historic properties are not the same as destruction and generally involve some diminishment of aspects of the properties which will be mitigated.</p> <p>Regarding your comment on stormwater runoff, a preliminary stormwater management analysis was completed for all alternatives and is documented in Chapter 2 of the DEIS and Section 2.3.2 of the SDEIS. Additional analysis will occur for the FEIS and continue through final design. Impacts to receiving waters will be addressed through the Maryland permitting process. Maryland Stormwater Management Law is relatively strict with the goal of maintaining post development runoff as nearly as possible to pre-development runoff characteristics. Water quantity is required to be managed onsite to match existing conditions. Water quality is required to be maximized onsite. Offsite water quality within the same 6-digit watershed can be allowed with sufficient justification. In short, the state will meet Maryland’s strict stormwater regulations. The FEIS includes the most recent preliminary plan and will update all plans with final design in accordance with Maryland Law.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p>
Montemarano, Arlene	I-195	Refer to Appendix T Page DEIS C–1298 thru 1304 for your exact comment.	<p>Thank you for your comment regarding synchronized autonomous vehicle. The expected influx of connected and autonomous vehicles (CAVs) will impact future traffic operations on all roads in Maryland, including I-495 and I-270. MDOT SHA participates in a statewide CAV working group (https://mva.maryland.gov/safety/Pages/MarylandCAV.aspx) to stay up to date on the latest research and industry projections. At this time, there are too many unknowns regarding how CAVs could affect demand and capacity to include CAVs directly in the traffic forecasts. Capacity will likely increase as vehicle spacing decreases, but the magnitude of the capacity increase is difficult to quantify based on the current research. Also, the benefits of more vehicles per lane may be offset by a potential increase in demand on the transportation network for some types of auto trips, including "mobility as a service" trips (people that can't afford their own car, but could call an autonomous vehicle for a solo trip) and "deadhead" trips (trips where the autonomous vehicle is empty, traveling to a parking lot or to the next</p>

Commenter	#	Reference to Comment	Response
			<p>pickup point). Therefore, the traffic projections for this Study apply traditional forecasting techniques, while being cognizant of the potential CAV impacts. However, it is anticipated that this project will be adaptable to accommodate CAVs because the proposed managed lanes will create a controlled environment with physical separation, new pavement, and clear delineations, features that are conducive to CAV use.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>

Montemarano, Arlene	I-445	Refer to Appendix T Page DEIS C–1340 thru 1343 for your exact comment.	<p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p>
Montemarano, Arlene	I-446	Refer to Appendix T Page DEIS C–1344 thru 1359 for your exact comment.	<p>Thank you for your comment on environmental impacts, project cost, alternate transportation improvements, and air quality. MDOT continues to be an active partner in the Maryland Commission on Climate Change (MCCC) and Maryland's greenhouse gas (GHG) reduction efforts. We are leading the way on transportation sector scenario and emissions analyses. We have worked with stakeholders, communities, and our partners on the Mitigation Working Group (MWG) to better understand the impacts of the changes within the transportation sector, ranging from technology improvements, such as the deployment of automated, connected, and electric vehicles to the importance of improving mobility and expanding telework.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p>
Montemarano, Arlene	I-586	Refer to Appendix T Page DEIS C–1360 thru 1363 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Montemarano, Arlene	I-587	Refer to Appendix T Page DEIS C–1364 thru 1367 for your exact comment.	<p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p>
Montemarano, Arlene	I-588	Refer to Appendix T Page DEIS C–1368 thru 1369 for your exact comment.	<p>Thank you for your comment concerning impacts to Rock Creek Park. As described in the Supplemental DEIS, this resource is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p>

Navarro, Nancy	I-304	Refer to Appendix T Page DEIS C–1466 thru 1468 for your exact comment.	<p>Thank you for your comment on the I-270 Pre NEPA study. The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p> <p>Regarding your comment on the Capital Beltway Accord, In November 2019, Governor Larry Hogan of Maryland and Governor Ralph Northam of Virginia announced a bi-state, bipartisan accord to create a new, unified Capital Beltway, replace the aging American Legion Bridge (ALB), and relieve congestion at one of the country's worst traffic chokepoints. Since the announcement, both Maryland and Virginia officials have been working together to define the details of the collaborative efforts to coordinate the design and construction of the ALB and connecting sections of I-495 along with long-term operation and maintenance of the facility. Once agreement has been reached by the parties, the Bi-State Agreement will be made available to the public.</p>

Novak, Mae	I-876	Refer to Appendix T Page DEIS C–1498 for your exact comment.	<p>Thank you for your comment concerning the Intercounty Connector. The purpose of MD 200 or the Intercounty Connector (ICC) is to provide free-flow uncongested trips between Montgomery County and Prince George’s County and to remove traffic from the local roadway network through Montgomery County. In the ICC Final Environmental Impact Statement, there was an alternative that would have improved I-495 instead of the ICC. However, that alternative did not meet the Study’s Purpose and Need of addressing congestion on the local routes in the MLS study area or to remove traffic, and thus congestion, from I-495.</p> <p>Currently, MD 200 has available capacity to accommodate additional traffic. During the typical peak hours in 2018, MD 200 carried approximately 3,600 vehicles per hour eastbound and approximately 4,200 vehicles per hour westbound. Because MD 200 is a managed tolled facility that is intended to always operate at free-flow speeds, it has a set capacity at Level of Service (LOS) D that cannot be exceeded. Therefore, the approximate capacity of MD 200 is 5,725 vehicles per hour in each direction.</p> <p>Traffic volumes on MD 200 are growing rapidly, and there will be little, or no, spare capacity by the design year of 2040. Traffic growth on MD 200 is occurring at a higher rate than regional traffic growth, which indicates that more motorists are willing to pay a toll to avoid severe congestion and delays on alternative routes. This means that there will be a limited amount of additional capacity available on MD 200 to accommodate traffic that may divert from I-495. As MD 200 is designed to maintain the free-flow LOS D conditions into the future, toll rates will need to be raised to ensure the traffic demand on the ICC does not exceed its capacity and additional traffic would divert to alternative routes.</p> <p>The ADT served on MD 200 in 2018 was more than double the ADT in 2012. The annual growth rate varies based on the time of day and the segment, but count data indicates that the annual growth rate between October 2016 and October 2018 was between three to four percent per year on the heaviest-used segments. The first segments of MD 200 that are projected to reach capacity would do so in the year 2027. By 2040, most of the segments of MD 200 will have reached capacity during the peak hours. Overall, MD 200 may be able to accommodate some additional traffic in 2040 in certain segments and during certain times of day, but it will not offset the need for capacity improvements on I-495. See Appendix B of the DEIS for more information.</p> <p>The Preliminary Range of Alternatives for the Study included alternatives that involved contraflow or reversible lane systems, specifically Alternative 12B: Contraflow</p>

Commenter	#	Reference to Comment	Response
			<p>Lane on I-270 and Alternative 13B: Priced Managed Reversible Lanes Network on I-270.</p> <p>Alternative 12B considers converting the existing HOV lanes on I-270 to a contraflow lane during peak periods. As discussed in Section 4.4.14 of Appendix B of the DEIS, contraflow on I-270 is unfavorable for several reasons including cross-median access points to the contraflow lane, operational challenges with a moveable barrier system, and congestion at the merge point when no additional capacity improvement is provided. Furthermore, taking away a lane from the off-peak direction would reduce capacity and could introduce congestion for a location that does not have congestion under No Build conditions.</p> <p>In addition, a contraflow system on I-270 with the HOV lanes would also be unfavorable for the following reasons:</p> <ul style="list-style-type: none"> • Contraflow lane would operate in the peak direction, so non-HOV users would have to merge into/across the existing HOV lanes to access the contraflow lane, potentially impacting the operations and enforcement of these lanes approaching the contraflow access points. It is also illegal for non-HOV users to use HOV lanes even for short merging periods. • Similarly, to exit the contraflow lane, non-HOV users would have to merge into/across the existing HOV lanes at the end of the contraflow lane, potentially impacting the operations and enforcement of these lanes approaching the contraflow access points. • It is most likely that the contraflow lane would be accessed at a single location and the exit from the contraflow lane would be at a single location (or a single location on each spur), effectively operating as an express lane for travelers that would want to travel the full length of the contraflow lane. <p>Alternative 12B only provides capacity in one direction on I-270 and does not meet the Study’s Purpose and Need; therefore, MDOT SHA dropped Alternative 12B from further consideration.</p> <p>Alternative 13B considers converting the existing HOV lanes in both directions to two HOT managed, reversible lanes on I-270. As discussed in Section 4.4.16 of Appendix B of the DEIS, with a reversible lane system, there is a lot of “down time” when the lanes cannot be used while they are being cleared and switched to the opposite direction. No operational benefit is experienced in either direction during this time, which can occur for several hours during the middle of the day when traffic demand remains high on I-270. Also, switching the system and ensuring that vehicles do not enter in the wrong direction (a potential safety hazard) requires extensive, daily maintenance. The time-of-day restrictions can also confuse motorists if the lanes are available for use at certain times, but not others. MDOT SHA carried Alternative 13B forward to perform detailed traffic analysis to confirm if this alternative could fully accommodate the long-term growth in the peak direction without deteriorating operations in the off-peak direction. Ultimately, Alternative 13B did not perform as well as the selected Preferred Alternative and was dropped from further consideration.</p> <p>In May, 2021, after several months of continuous collaboration and listening to agency partners, public officials and stakeholders, the Federal Highway Administration (FHWA) and MDOT SHA identified Alternative 9 – Phase 1 South: American Legion Bridge I-270 to I-370, as the Preferred Alternative for the I-495 & I-270 Managed Lanes Study. The Preferred Alternative focuses solely on building a new American Legion Bridge and delivering two high occupancy toll managed lanes in each direction on Phase 1 South: American Legion Bridge I-270 to I-370.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p>

O'Connor, Cecile	I-448	Refer to Appendix T Page DEIS C–1501 for your exact comment.	<p>Thank you for your comment on the Purpose & Need and induced demand. MDOT has coordinated with local stakeholders throughout the NEPA process, including Montgomery County.</p> <p>MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>The Study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled (VMT) in the region) and those effects are fully accounted for in the regional traffic models COG and TPB use. Even with these effects, the proposed managed lanes would reduce regional congestion delays and significantly improve travel times along both freeway corridors and on local roads throughout the region.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

O'Connor, Cecile	I-1477	<p>Refer to Appendix T Page DEIS C–1502 thru 1506 for your exact comment.</p>	<p>Thank you for your comment concerning impacts to Georgia Avenue and Colesville Road. As described in the Supplemental DEIS, these facilities and Silver Spring are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Based on federal regulations, 40 CFR 1506.5, the lead federal agency is responsible for the accuracy, scope and content of environmental documents and those documents may be prepared by contractors or consultants that have demonstrated they do not have any financial or other interest in the outcome of the project. Under 40 CFR 1506.5(b)(3), the lead federal agency is responsible for providing names and qualifications of the persons preparing the document in the document. Refer to DEIS and SDEIS Chapter 8-List of Preparers and FEIS- Chapter 9- List of Preparers for names and qualifications of preparers for each document. FHWA, as lead federal agency, retains the responsibility to conduct an independent evaluation of information submitted and environmental documents prepared by an applicant or contractor. MDOT SHA did not directly purchase data from Streetlight Data for the sole purpose of using the information for the I-495 & I-270 Managed Lanes Study.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

Orleans, Bill	I-361	Refer to Appendix T Page DEIS C–1518 thru 1521 for your exact comment.	<p>Refer to MDOT SHA Response Letter dated September 15, 2020 for a response to your specific request.</p> <p>MDOT SHA and FHWA not only fulfilled but exceeded the NEPA regulation requirements for publication of the DEIS and supporting appendices for public review and comment. On July 10, 2020, MDOT SHA and FHWA published the DEIS and made it available on the I-495 & I-270 P3 Program webpage and on the U.S. Environmental Protection Agency (USEPA) EIS Database webpage. To accommodate persons without computer access to view the DEIS in hard copy, MDOT SHA and FHWA employed innovative approaches. Temporary facilities to house the DEIS for public review are located at eight community-based public library locations along the I-495 and I-270 corridors as well as one location in Washington, D.C. due to the continued closure of public facilities. Lobbies at six centrally located post offices in Montgomery and Prince George’s counties are also being used for DEIS viewing locations. Day and evening hours, week and weekend days are available to provide adequate options for the public to view the documents. Lastly, MDOT SHA, Maryland Transportation Authority, and Virginia Department of Transportation offices within or near the study area are also open to the public for viewing of the DEIS and Technical Reports. Finally, we provided an initial public comment period that was double the regulatory minimum and extended the period by another 30 days, for a total of 120 days, to accommodate requests from the public and elected officials.</p> <p>The effort to provide opportunity for comment on the DEIS was unprecedented in Maryland. MDOT SHA and FHWA successfully held four virtual public hearings, each lasting nine hours. Two in-person public hearings were also held in early September, each lasting 9 hours, in full compliance with state mandated COVID-19 guidelines to keep both the public and our staff safe. The virtual hearings held were live-streamed and the recorded testimony posted on the I-495 & I-270 P3 Program webpage for full transparency. Additionally, each virtual and in-person hearing could be listened to live via phone to accommodate persons without access to a computer.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>

Patterson, Mary-Margaret	I-1374	Refer to Appendix T Page DEIS C–1544 thru 1545 for your exact comment.	<p>Thank you for your comment concerning impacts to your home on Montgomery Avenue in Chevy Chase. As described in the Supplemental DEIS, your home is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on noise impacts, there is an existing sound barrier located along the inner loop of I-495 from east of Kensington Parkway to east of Linden Lane. Please note that a sound barrier is designed to lower the overall traffic noise level but will not eliminate it entirely. The sound barrier is not intended to mitigate point source noise emissions such as air brakes, motorcycles and modified exhaust systems on vehicles and trucks. If future improvements are advanced in the vicinity of your community, regardless of whether the existing sound barrier is relocated, noise impacts will be analyzed in compliance with Federal and State policies, and abatement will be evaluated accordingly. At this time, there is no mechanism for the state to evaluate the need for additional noise abatement to your community outside of a roadway improvement project such as the Managed Lanes Study.</p>

Patwardhan, Stacy	I-526	Refer to Appendix T Page DEIS C–1547 for your exact comment.	<p>Thank you for your comment concerning impacts to Rock Creek Park. As described in the Supplemental DEIS, this resource is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment concerning smart cars. We concur that the expected influx of driverless smart cars, or more broadly "connected and autonomous vehicles" (CAVs), will impact future traffic operations on all roads in Maryland, including I-495 and I-270. MDOT SHA participates in a statewide CAV working group (https://mva.maryland.gov/safety/Pages/MarylandCAV.aspx) to stay up to date on the latest research and industry projections. At this time, there are too many unknowns regarding how CAVs could affect demand and capacity to include CAVs directly in the traffic forecasts. Capacity will likely increase as vehicle spacing decreases, but the magnitude of the capacity increase is difficult to quantify based on the current research. Also, the benefits of more vehicles per lane may be offset by a potential increase in demand on the transportation network for some types of auto trips, including "mobility as a service" trips (people that can't afford their own car, but could call an autonomous vehicle for a solo trip) and "deadhead" trips (trips where the autonomous vehicle is empty, traveling to a parking lot or to the next pickup point). It is anticipated that this project will be adaptable to accommodate CAVs because the proposed managed lanes will create a controlled environment with physical separation, new pavement, and clear delineations, features that are conducive to CAV use.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p>

Perez, Rodolfo	I-452	Refer to Appendix T Page DEIS C–1557 for your exact comment.	<p>Thank you for your comment concerning consistency with the Transportation Planning Board’s regional initiatives. This project is consistent with the Transportation Planning Board's Visualize 2045 plan, which recommends expanding the express highway network through construction of congestion-free toll roads in conjunction with transit projects and other initiatives. Therefore, roadway capacity improvements are also needed to help relieve congestion in the region.</p> <p>Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p>

Commenter	#	Reference to Comment	Response
Perez, Rodolfo	I-1311	Refer to Appendix T Page DEIS C–1558 thru 1566 for your exact comment.	<p>Thank you for your comment on traffic concerns, the alternative analysis, the purpose and need, and environmental impacts. For more detailed responses to many of your comments, see references provided below. Regarding your comment on the Regional Land-Use Balance initiatives, The No Build includes the latest MWCOG land use assumptions available at the time of the study. One of TPB’s 5 approved initiatives includes regional express travel network. The No Build and Build traffic analysis for the 2045 design year assumed completion of several background projects included in the region’s CLRP. The transit projects included in the CLRP include:</p> <ul style="list-style-type: none"> • MD 355 BRT • Veirs Mill Road BRT • New Hampshire Avenue BRT <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to FEIS, Chapter 4, Section 4.1.3 and FEIS, Appendix A for additional details on project included in the regional model.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>

Peterson, Jonathan	I-1312	Refer to Appendix T Page DEIS C–1581 for your exact comment.	<p>Thank you for your comment on support for mass transit and environmental impacts. Regarding your comment on mitigation, Since the project is in its planning stages, the locations of forest mitigation have not been finalized. The Study project team is coordinating closely with MDNR and will coordinate mitigation sites with the Forestry Service. Preliminary coordination has occurred and a mitigation site search has been conducted and results shared with MDNR for further coordination. Similarly, mitigation strategies for displaced wildlife have been coordinated to some extent, but have not been finalized. For instance, the project team has coordinated with USFWS regarding the peregrine falcon nesting box on the American Legion Bridge. The nesting box will be removed prior to construction and replaced once the bridge has been rebuilt. Specific logistics of this process have not been determined yet. The project team has coordinated with MDNR to conduct a mussel survey within the project LOD in the Potomac River and Rock Run Culvert. Depending on whether state-listed species are found during the survey, mussels may or may not need to be relocated. The project team is working closely with cooperating resource agencies to determine the best mitigation strategies for displaced wildlife.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p>

Plano, Chris	I-258	Refer to Appendix T Page DEIS C–1595 for your exact comment.	<p>Thank you for your comment on the Purpose and Need, tolling existing I-495 and I-270 lanes, parkland impact, climate change and air quality. Regarding your comment on tolling existing lanes, Under Title 23 of the U.S. Code (Highways), there is a long-standing general prohibition on the imposition of tolls on Federal-aid highways; however, Title 23 and other statutes have carved out certain exceptions to this general prohibition through special programs. These programs allow tolling to generate revenue to support highway construction activities and/or enable the use of road pricing for congestion management. If Federal funds have been used or will be used on the highway, then the public authority responsible for the facility must qualify for toll authority under one of these Federal toll programs. Within these programs, there are two that have been specially authorized by Congress on a pilot basis in various highway authorization acts since 1991. Participation in these programs is limited to a set number of slots that have been authorized for each program. Project sponsors are also required to submit an application and to execute a toll agreement with FHWA to receive authorization to impose tolls under these programs.</p> <p>While Title 23 does not preclude tolling existing interstates, tolling all the I-495 & I-270 existing lanes would not adequately address the need for a long-term solution to regional congestion. Even if tolled, the existing lanes would not be able to accommodate demand, which would still result in a breakdown of traffic flow on the facilities. Tolling all the lanes would also not provide reasonable and equitable options for drivers who are not willing or able to pay a toll, resulting in more traffic on local arterial roads, which are not able to handle additional traffic. The combination of dynamically priced lanes and free general-purpose lanes allows MDOT to better manage these highly congested facilities and improve travel speeds and reduce delay for all drivers.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p>

Pollard, Elizabeth S.	I-951	Refer to Appendix T Page DEIS C–1599 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Pollock, Michael	I-880	Refer to Appendix T Page DEIS C–1600 for your exact comment.	<p>Thank you for your comment on the ICC. The primary Purpose and Need for the ICC was not to relieve congestion on 495. Currently, MD 200 has available capacity to accommodate additional traffic. During the typical peak hours in 2018, MD 200 carried approximately 3,600 vehicles per hour eastbound and approximately 4,200 vehicles per hour westbound. Because MD 200 is a managed tolled facility that is intended to always operate at free-flow speeds, it has a set capacity at Level of Service (LOS) D that cannot be exceeded. Therefore, the approximate capacity of MD 200 is 5,725 vehicles per hour in each direction.</p> <p>However, traffic volumes on MD 200 are growing rapidly, and there will be little, or no, spare capacity by the design year (originally 2040, but updated to 2045 in the SDEIS and FEIS). Traffic growth on MD 200 is occurring at a higher rate than regional traffic growth, which indicates that more motorists are willing to pay a toll to avoid severe congestion and delays on alternative routes. This means that there will be a limited amount of additional capacity available on MD 200 to accommodate traffic that may divert from I-495. As MD 200 is designed to maintain the free-flow LOS D conditions into the future, toll rates will need to be raised to ensure the traffic demand on the ICC does not exceed its capacity and additional traffic would divert to alternative routes.</p> <p>The ADT served on MD 200 in 2018 was more than double the ADT in 2012. The annual growth rate varies based on the time of day and the segment, but count data indicates that the annual growth rate between October 2016 and October 2018 was between three to four percent per year on the heaviest-used segments. The first segments of MD 200 that are projected to reach capacity would do so in the year 2027. By 2040, most of the segments of MD 200 will have reached capacity during the peak hours. Overall, MD 200 may be able to accommodate some additional traffic in 2040 in certain segments and during certain times of day, but it will not offset the need for capacity improvements on I-495.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

			<p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p>
Rainey, Wendy	I-1313	Refer to Appendix T Page DEIS C–1614 for your exact comment.	<p>Thank you for your comment concerning impacts to Forest Estates Community. As described in the Supplemental DEIS, this community is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>There is an existing sound barrier along the outer loop of I-495 between Holy Cross Hospital and Georgia Avenue. Sound barriers are designed to lower the overall traffic noise level but will not eliminate the noise entirely. Sound travels in waves, and is dependent on ground cover, topography and atmospheric conditions as well as intervening obstacles (such as sound barriers, buildings or vegetation). It is measured on a logarithmic scale, which means that in order for there to be a perceptible increase in noise, either traffic volume would need to double and still operate at high speeds, or the roadway would need to move closer to the residence. If future improvements are advanced in the vicinity of your community, noise impacts will be analyzed in compliance with Federal and State policies, and abatement will be evaluated accordingly.</p> <p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p>

Rayman, Anne	I-971	<p>Refer to Appendix T Page DEIS C–1623 for your exact comment.</p>	<p>Thank you for your comment concerning impacts to Woodley Gardens Park and Upper Watts Branch. The I-495 & I-270 Managed Lanes Study Preferred Alternative LOD has been limited as much as possible to avoid impacts to environmental resources. Environmental scientists have been working for over 4-years on behalf of MDOT SHA with the regulatory agencies and project engineers to avoid and minimize impacts to wetlands, their buffers, waterways, and floodplains to the maximum extent practicable. The Study Preferred Alternative would not impact Woodley Gardens Park. The Preferred Alternative would impact Upper Watts Branch, since it is necessary for an augmented culvert to be installed alongside the existing culvert that carries Watts Branch under I-270 to limit flood risk to the surrounding area. The potential impact to Watts Branch has been limited as much as possible while still allowing enough room for construction of the augmented culvert.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>

Reger, Jeff	I-394	Refer to Appendix T Page DEIS C–1628 thru 1629 for your exact comment.	<p>Thank you for your comment on the I-495 & I-270 MLS. The Draft Compensatory Mitigation Plan was included as an appendix to the DEIS. This plan outlined the detailed mitigation site search as well as the resulting mitigation sites identified for stream and wetland restoration as Section 404 mitigation for the I-495 & I-270 MLS. The Final Compensatory Mitigation Plan is appended to the FEIS and includes the Phase II mitigation plans for the selected stream and wetland mitigation sites and all other mitigation sites in Maryland. <i>See FEIS Appendix O.</i> Virginia has a mitigation credit program that identifies appropriate sites for wetland and stream mitigation to compensate for unavoidable impacts. Onsite stormwater management has been maximized to the greatest extent practicable within the Study Preferred Alternative LOD. The remaining stormwater treatment will be achieved offsite. The Compensatory Stormwater Mitigation Plan is appended to the SDEIS and includes a summary of the site search process and the resulting stormwater sites identified for offsite stormwater management to cover the stormwater treatment need for the Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>
Reichel, Carsten	I-1416	Refer to Appendix T Page DEIS C–1630 for your exact comment.	<p>Thank you for your comment concerning impacts to your neighborhood. As described in the Supplemental DEIS, your neighborhood is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>There is an existing sound barrier located along the inner loop of I-495 between Seminary Road and Georgia Avenue. If future improvements are advanced in this area, noise impacts will be analyzed in compliance with Federal and State policies, and abatement will be evaluated accordingly.</p>

Rein, Judy	I-253	Refer to Appendix T Page DEIS C–1633 thru 1635 for your exact comment.	<p>Thank you for your comment on the I-495 & I-270 MLS. The DEIS and SDEIS details the sections of I-270 and I-495 that are being addressed as a part of the Study.</p> <p>Regarding your comment on widening adjacent to MD 650, Connecticut Avenue, New Hampshire Avenue, US 1, Pennsylvania Avenue, and MD 4. As described in the Supplemental DEIS, these facilities are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on autonomous vehicles, the expected influx of connected and autonomous vehicles (CAVs) will impact future traffic operations on all roads in Maryland, including I-495 and I-270. MDOT SHA participates in a statewide CAV working group (https://mva.maryland.gov/safety/Pages/MarylandCAV.aspx) to stay up to date on the latest research and industry projections. At this time, there are too many unknowns regarding how CAVs could affect demand and capacity to include CAVs directly in the traffic forecasts. Capacity will likely increase as vehicle spacing decreases, but the magnitude of the capacity increase is difficult to quantify based</p>

Commenter	#	Reference to Comment	Response
			<p>on the current research. Also, the benefits of more vehicles per lane may be offset by a potential increase in demand on the transportation network for some types of auto trips, including "mobility as a service" trips (people that can't afford their own car, but could call an autonomous vehicle for a solo trip) and "deadhead" trips (trips where the autonomous vehicle is empty, traveling to a parking lot or to the next pickup point). Therefore, the traffic projections for this Study apply traditional forecasting techniques, while being cognizant of the potential CAV impacts. However, it is anticipated that this project will be adaptable to accommodate CAVs because the proposed managed lanes will create a controlled environment with physical separation, new pavement, and clear delineations, features that are conducive to CAV use.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p>

Renner, Rob	I-141	Refer to Appendix T Page DEIS C–1639 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Reschovsky, Jim	I-1033	Refer to Appendix T Page DEIS C–1640 thru 1645 for your exact comment.	<p>Thank you for your comments. Refer to the references below which provide response to many of your comments.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p>

Commenter	#	Reference to Comment	Response
			<p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.3.B for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Reyes, Jose	I-766	Refer to Appendix T Page DEIS C–1647 for your exact comment.	<p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Reynolds, Chris	I-1414	Refer to Appendix T Page DEIS C–1648 for your exact comment.	<p>Thank you for your comment concerning toll roads. Under Title 23 of the U.S. Code (Highways), there is a long-standing general prohibition on the imposition of tolls on Federal-aid highways; however, Title 23 and other statutes have carved out certain exceptions to this general prohibition through special programs. These programs allow tolling to generate revenue to support highway construction activities and/or enable the use of road pricing for congestion management. If Federal funds have been used or will be used on the highway, then the public authority responsible for the facility must qualify for toll authority under one of these Federal toll programs. Within these programs, there are two that have been specially authorized by Congress on a pilot basis in various highway authorization acts since 1991. Participation in these programs is limited to a set number of slots that have been authorized for each program. Project sponsors are also required to submit an application and to execute a toll agreement with FHWA to receive authorization to impose tolls under these programs.</p> <p>The INTERSTATE SYSTEM RECONSTRUCTION AND REHABILITATION PILOT PROGRAM allows the conversion of a facility on the Interstate System into a toll facility in conjunction with needed reconstruction or rehabilitation that is only possible with the collection of tolls. Congress has authorized up to three slots in the program, which must be used for projects in different States. The VALUE PRICING PILOT PROGRAM (VPPP) is an experimental program that is designed to assess the potential of different value pricing approaches for reducing congestion. Under this program, tolls may be imposed on existing toll-free highways, bridges, and tunnels, so long as</p>

Commenter	#	Reference to Comment	Response
			<p>variable pricing is used to manage demand. Congress has authorized up to 15 slots under the VPPP, which are allocated to State or local agencies.</p> <p>While Title 23 does not preclude tolling existing interstates, tolling all the I-495 & I-270 existing lanes would not adequately address the need for a long-term solution to regional congestion. Even if tolled, the existing lanes would not be able to accommodate demand, which would still result in a breakdown of traffic flow on the facilities. Tolling all the lanes would also not provide reasonable and equitable options for drivers who are not willing or able to pay a toll, resulting in more traffic on local arterial roads, which are not able to handle additional traffic. The combination of dynamically priced lanes and free general-purpose lanes allows MDOT to better manage these highly congested facilities and improve travel speeds and reduce delay for all drivers.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p>

			<p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Rodriguez, Samantha	I-1106	<p>Refer to Appendix T Page DEIS C–1659 thru 1660 for your exact comment.</p>	<p>Thank you for your comments. As further discussed in Chapter 9, references below, MDOT SHA and FHWA take their responsibility to provide the public with sufficient information and to consider public input seriously. The many public meetings, publications and website are a part of that effort. The DEIS /SDEIS and this FEIS are more extensive than required by the NEPA; however these documents provide different layers of detail to allow the public to review either the Executive Summaries, the main body of each EIS or to go beyond that which is anticipated by NEPA and review more detailed analysis performed and provided in the Appendices. As further discussed in the FEIS and specifically in Chapter 9, the Study was not intended to address all transportation concerns of the region. MDOT engages with regional transportation planning to identify a series of projects, see the Constrained Long Range Plan, to address a wider variety of concerns. By way of example, the Purple Line, is another MDOT initiative studied and supported by the FTA, to address a different set of transportation objectives. Also note that the Proposed Alternative includes pedestrian, cycle and transit initiatives.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Rogers, Robert	I-182	Refer to Appendix T Page DEIS C–1664 for your exact comment.	<p>Thank you for your comment. MDOT is committed to finding solutions to relieve congestion and to ensure transportation improvements are being developed to meet the State's needs not only for today but for the future. MDOT agrees that the National Capital Region needs increased telework, transit, and express highway improvements to address the long-term congestion. All these improvements must be planned to function as a cohesive system of systems, but to achieve this it is necessary to focus individual projects on specific solutions. New options are continuously being considered. Note that the Preferred Alternative includes various pedestrian, bicycle and transit elements.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study, including the No-Build Alternative.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

Roots, David	I-915	<p>Refer to Appendix T Page DEIS C–1671 for your exact comment.</p>	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>
Rosendorf, Linda	I-144	<p>Refer to Appendix T Page DEIS C–1676 thru 1681 for your exact comment.</p>	<p>Thank you for your comment on environmental impacts associated with the Study. Regarding your comment on mitigation for stormwater. Mitigation for stormwater is not anticipated due to the stringent permitting requirements in Maryland, which this project will have to meet. Permitting requirements include: controlling stormwater runoff for the 10-year storm to match existing conditions, providing water quality treatment for all new impervious area and 50% of reconstructed impervious area to match the runoff characteristics of woods in good condition and managing the 2-year storm during construction so that sediment is not released to local waterways. Variances can be requested for minimal increases in stormwater runoff, however, detailed hydrologic calculations will be required to show that the minimal increases will not result in downstream flooding or erosion. Given the strict permitting requirements, impacts to local waterways are not expected.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study, including the No-Build Alternative.</p> <p>Refer to Chapter 9, Section 3.4.I for a response to construction impacts.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>

			Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.
Ryan, Myra	I-1175	Refer to Appendix T Page DEIS C–1706 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Ryder, Phyllis	I-1042	Refer to Appendix T Page DEIS C–1707 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4.G for a response to climate change considerations. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Sabol, Edward	I-775	Refer to Appendix T Page DEIS C–1708 for your exact comment.	Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads. Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. Refer to Chapter 9, Section 3.4.G for a response to climate change considerations. Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources. Refer to Chapter 9, Section 3.4.I for a response to construction impacts.
Sagstetter, Philip	I-611	Refer to Appendix T Page DEIS C–1709 for your exact comment.	Thank you for your comment concerning impacts to your property. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements; therefore, no homes would be taken due to the proposed roadway widening. The Preferred Alternative was identified after coordination with resource agencies, the public, and stakeholders to respond directly to feedback received on the DEIS to avoid displacements and impacts to significant environmental resources, and to align the NEPA approval with the planned project phased delivery and permitting approach which focused on Phase 1 South only. The Preferred Alternative includes two new, high-occupancy toll (HOT) managed lanes on I-495 in each direction from the George Washington Memorial Parkway to east of MD 187 and conversion of the one existing high-occupancy vehicle lane in each direction on I-270 to a HOT managed lane and adding one new HOT managed lane in each direction on I-270 from I-495 to north of I-370 and on the I-270 east and west spurs. At the I-495 interchange with the I-270 west spur, two HOT managed lanes would be provided northbound toward I-270 in addition to the two existing general purpose lanes which would be maintained. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.
Sahli, Barbara	I-1409	Refer to Appendix T Page DEIS C–1710 for your exact comment.	Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost. Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.

Salas, Magalie	I-460	Refer to Appendix T Page DEIS C–1711 for your exact comment.	<p>Thank you for identifying the additional community facility, Saint Camillus Catholic Church, not included in the results of desktop research conducted for the DEIS. The National Environmental Study Act (NEPA) Study process relies on dialogue with affected communities to produce a comprehensive document and to conduct iteratively more inclusive outreach.</p> <p>Impacts to EJ populations (block groups) have been substantially reduced due to the selection of the Preferred Alternative/Phase 1 South limits in the SDEIS. Previously in the DEIS, 111 block groups were identified as EJ populations. In the SDEIS and FEIS under the 12-mile Preferred Alternative/Phase 1 South limits, 16 block groups were identified as EJ populations. This resulted in a reduction from 55 percent EJ populations to 24 percent EJ populations between the DEIS and the SDEIS/FEIS. Under the Preferred Alternative, impacts to 95 EJ block groups are avoided, including impacts to Latinx populations served by Saint Camillus Catholic Church and living in the Silver Spring area.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.7 for a response to comments related to public involvement and engagement.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>

Sapir, Judith S.	I-179	Refer to Appendix T Page DEIS C–1718 for your exact comment.	<p>Thank you for your comment concerning impacts to the Congressional Country Club Estates community. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements; therefore, no homes would be taken due to the proposed roadway widening. The proposed construction activities along Persimmon Tree Road and the replacement of the existing bridge over I-495 would be limited to within existing public right-of-way. Sliver impacts to properties along I-495 are proposed for elements such as roadside grading, on-site drainage and stormwater management, and noise barrier replacement/construction. These partial property acquisitions are considered ones that do not cause a business or residential relocation and have been assumed where a principle building of a residence, business, or community facility is located more than 20 feet from the Preferred Alternative limits of disturbance.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>

Scheufler, Mark	I-1191	Refer to Appendix T Page DEIS C–1723 thru 1726 for your exact comment.	<p>Thank you for your comment. As described in the Supplemental DEIS, the Preferred Alternative was identified after coordination with resource agencies, the public, and stakeholders to respond directly to feedback received on the DEIS to avoid displacements and impacts to significant environmental resources, and to align the NEPA approval with the planned project phased delivery and permitting approach which focused on Phase 1 South only.</p> <p>The Preferred Alternative includes two new, high-occupancy toll (HOT) managed lanes on I-495 in each direction from the George Washington Memorial Parkway to east of MD 187 and conversion of the one existing high-occupancy vehicle lane in each direction on I-270 to a HOT managed lane and adding one new HOT managed lane in each direction on I-270 from I-495 to north of I-370 and on the I-270 east and west spurs. Along I-270, the existing collector-distributor (C-D) lane separation from Montrose Road to I-370 would be removed as part of the proposed improvements. Transit buses and HOV 3+ vehicles would be allowed free passage in the managed lanes. The Preferred Alternative includes no action or no improvements at this time on I-495 east of the I-270 spur to MD 5 in Prince George's County. See Figure 1-1 in the Supplemental DEIS on pg. 1-2.</p> <p>The Preliminary Range of Alternatives for the Study included alternatives that involved contraflow or reversible lane systems. MDOT SHA dropped these alternatives from further consideration due to challenges such as cross-median access points to the contraflow lane, operational challenges with a moveable barrier system, and congestion at the merge point when no additional capacity improvement is provided. Furthermore, taking away a lane from the off-peak direction would reduce capacity and could introduce congestion for a location that does not have congestion under No Build conditions.</p> <p>The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p>

Schneider, Andrew	I-1315	Refer to Appendix T Page DEIS C–1732 thru 1733 for your exact comment.	<p>Thank you for your comment concerning impacts to the Indian Spring neighborhood, Rock Creek Park, Sligo Creek Park and Greenspring Park. As described in the Supplemental DEIS, these parks and neighborhood are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels.

Commenter	#	Reference to Comment	Response
			<p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>

			<p>separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>
Schulte, Aileen	I-1406	Refer to Appendix T Page DEIS C–1737 thru 1738 for your exact comment.	<p>Thank you for your comment concerning impacts to neighborhoods around the I-495/Georgia Ave interchange and Sligo Creek Park. As described in the Supplemental DEIS, this area is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>As noted in Section 3.3.6 of the DEIS, the net impact of the project will be an overall reduction in delay on the surrounding arterials such as Georgia Avenue, despite some localized increases in arterial traffic near the managed lane access interchanges. The portions of the local road network with an anticipated increase in volumes are being evaluated in more detail as part of the FEIS, and mitigation will be proposed where needed to maintain acceptable operations per FHWA Interstate Access Point Approval guidelines.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.3.B for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Sheffield, Steve	I-1402	Refer to Appendix T Page DEIS C–1776 thru 1777 for your exact comment.	<p>Thank you for your comment concerning Plummers Island. MDOT SHA convened an 'ALB Strike Team' composed of national and local experts on bridge design, natural resources, and cultural resources who were charged with the following mission: To develop and evaluate alternatives for the replacement of the ALB to avoid impacts, to the greatest extent practicable, and reduce overall acreage impacts to the Chesapeake and Ohio Canal National Historic Park (CHOH) and GWMP units of the NPS, including Plummers Island. Impacts to Plummers Island were avoided and minimized to the greatest extent practicable while still maintaining a constructible project. Additional information regarding Potomac Gorge plant and animal species were included in the revised Natural Resources Technical Report, which is appended to the FEIS. MDOT SHA continues to coordinate with NPS regarding potential mitigation for unavoidable impacts.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>
Sherman, Sally	I-1547	Refer to Appendix T Page DEIS C–1778 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and project cost.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>

Shifrin, Yuliya	I-505	Refer to Appendix T Page DEIS C–1781 for your exact comment.	<p>Thank you for your comment concerning traffic noise. As described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum, there were 64 noise sensitive areas (NSA) identified along the study corridor. Within these NSA's, several noise barrier scenarios were considered: existing noise barriers to remain in place; existing noise barriers displaced by proposed construction to be replaced by a reconstructed barrier on a new alignment; existing noise barriers that were evaluated for extensions; and new noise barriers on new alignment. Noise analysis is one requirement of the NEPA process. Noise analysis follows the noise policy and guidelines as set forth by MDOT SHA in their Highway Noise Abatement Planning and Engineering Guidelines. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), <i>Procedures for Abatement of Highway Traffic Noise and Construction Noise</i> and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, <i>Highway Traffic Noise: Analysis and Abatement Guidance</i> and subsequent revisions. MDOT SHA developed their Highway Noise Abatement Planning and Engineering Guidelines to provide detailed implementation guidance,</p>

Slater, Tina	I-462	Refer to Appendix T Page DEIS C–1805 for your exact comment.	<p>Thank you for your comment. Regarding your comment on the study from the Maryland Transportation institute, the 495 & I-270 Managed Lanes Study project team is very familiar with the Maryland Statewide Transportation Model (MSTM), and actually worked closely with the University of Maryland to develop the tool. SHA TFAD maintains the tool at SHA headquarters and therefore understands the uses and limitations of the tool. The modeling performed by the University of Maryland had some limitations.</p> <ul style="list-style-type: none"> • It did not look at future demand or traffic growth. In fact, the volumes were based on year 2015 model data, which is now 5 years old. SHA must design facilities to accommodate traffic demand 20 to 25 years into the future. Therefore, we must account for increases in population and employment that will increase travel demands in the future. We project that the population of in the DC Metro region will increase by over 1 million people by 2040 and that traffic volumes on I-270 will increase by 15% to 17%. Therefore, to achieve sustainable congestion relief, future demand would have to be reduced by 20% to 30% compared to baseline levels. • The MSTM modeling did not account for latent demand. Latent demand represents the trips that would prefer to travel on the freeways (I-270 and I-495) during the peak periods, but avoid them due to the congestion. This includes shifting departure time (such as commuters leaving their home at 5:00 AM to “beat the rush”) and using different routes (going the “back way” through the local roadway network). These are things that were already happening under existing conditions (pre-pandemic), and they lead to other operational issues. Shifting trips to different times and different routes has its own consequences. First, the peak period becomes spread out (congestion occurred 7 to 10 hours per day before the pandemic on I-270 and I-495). Second, the local arterial network also experiences severe congestion, so there is no spare capacity to accommodate diverted trips. • The model used for the University of Maryland study (a DTALite model with data from the MSTM) is a mesoscopic model that does not adequately analyze merging and weaving conditions, which also contribute to congestion. More detailed microscopic simulation models (such as the VISSIM models used by the Managed Lanes Study team) are required to fully evaluate the impacts of volume changes on congestion levels. <p>The study notes that a small decrease in volume leads to a large decrease in congestion. On the flip side, this also means that a small increase in volume could lead to a large increase in congestion (demand is near the “tipping point”). Whether this increase comes from regional traffic growth or a shift away from HOV and transit, we</p>

Commenter	#	Reference to Comment	Response
			<p>need to be prepared to accommodate it.</p> <p>Finally, the study notes that we only need to move 2,800 vehicles off I-270 during the afternoon peak period to reduce congestion. That means that if we can provide a managed lane system to accommodate the excess demand, congestion will also improve in the general purpose lanes. This is exactly what Lead Agencies are seeing in our modeling, and it is why we find great value in the managed lanes project. MDOT SHA is designing a managed lane system that can accommodate that volume and more in the long term. The project will provide a reliable trip option for travelers in the managed lanes (including buses), will reduce congestion in the general purpose lanes, and will also accommodate some latent demand, which will reduce peak spreading and reduce congestion on the local roadway network.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.G for a response to climate change considerations.</p>

			Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.
Smith, Walton	I-1399	Refer to Appendix T Page DEIS C–1818 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.
Smoot, Sebastian	I-1107	Refer to Appendix T Page DEIS C–1819 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.
Snyder, Jeffrey	I-949	Refer to Appendix T Page DEIS C–1820 for your exact comment.	Thank you for your comment concerning impacts to the Colesville Road YMCA. As described in the Supplemental DEIS, this facility is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.
Socha, Debra	I-764	Refer to Appendix T Page DEIS C–1821 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost. Refer to Chapter 9, Section 3.6.A for a response on opposition to managed lanes or tolling public roads.
Sonneville, Walter	I-725	Refer to Appendix T Page DEIS C–1822 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.
Sorkin, Sarah	I-437	Refer to Appendix T Page DEIS C–1823 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.
Spodak, William	I-707	Refer to Appendix T Page DEIS C–1824 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost. Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.

Spokane, Abbe	I-374	Refer to Appendix T Page DEIS C–1825 for your exact comment.	<p>Thank you for your comment concerning impacts to Indian Springs Terrace Local Park and the Silver Spring YMCA. As described in the Supplemental DEIS, these resources are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.L for a response to public health impacts.</p> <p>Refer to Chapter 9, Section 3.4.D for a response to Environmental Justice and equity concerns.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>
Sprague, Barbara	I-567	Refer to Appendix T Page DEIS C–1826 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.
Spreitzer, Jennifer	I-296	Refer to Appendix T Page DEIS C–1827 thru 1828 for your exact comment.	<p>Thank you for your comment on impacts to Carderock Springs South. The Preferred Alternative, as described in the Supplemental DEIS, includes reconstruction of the existing Persimmon Tree Road bridge over I-495 and the existing I-495 bridge over Seven Locks Road.</p> <p>As part of this project, a new sound barrier is proposed along the inner loop of I-495 from just south of Cabin John Parkway to Persimmon Tree Road. The existing sound barrier that crosses Seven Locks Road along the outer loop of I-495 will be replaced and extended along the outer loop of I-495 to Persimmon Tree Road. Both of these barriers will be built at the expense of the project, and will be owned and maintained by MDOT SHA. The new barriers will be constructed as close to the roadway as possible to minimize or avoid property impacts.</p> <p>The DEIS, SDEIS and FEIS all include the “Statement of Likelihood” that is required by FHWA regulation 23 CFR 772.13(g)(3):</p> <p>“A statement of likelihood shall be included in the environmental document since feasibility and reasonableness determinations may change due to changes in project design after approval of the environmental document. The statement of likelihood shall include the preliminary location and physical description of noise abatement measures determined feasible and reasonable in the preliminary analysis. The statement of likelihood shall also indicate that final recommendations on the construction of an abatement measure(s) is determined during the completion of the project's final design and the public involvement processes.”</p> <p>Because we are in the NEPA phase of this project, we do not yet have detailed engineering plans, including soil borings and field surveyed topography. This level of detail is obtained during the final design phase of a project. The design, appearance and final alignment of the sound barriers will also be finalized during final design. The project must receive NEPA approval before final design is initiated, per 23 CFR 771.113(a). MDOT SHA is sensitive to the visual impact of a sound barrier when it is located directly adjacent to a residence. Sound barriers are most effective when placed directly adjacent to either the noise source (the highway) or the receiver (the residence). Ideally sound barriers are placed close to the highway, but in some cases, they must be located close to a residence in order to maximize the effectiveness. Sound barriers have a height limitation of 40 feet, and any structure over 24 feet requires a significantly larger foundation (which leads to more ground disturbance and environmental impacts). MDOT SHA will make every effort to keep the sound barriers as close to the highway as possible, but because of the varied topography of the area, it may be necessary to locate portions of the barriers at the top of the slope in order for them to effectively reduce the highway noise levels.</p>

Stahl, Kathryn	I-290	Refer to Appendix T Page DEIS C–1832 for your exact comment.	<p>Thank you for your concerning impacts to Silver Spring and The YMCA. As described in the Supplemental DEIS, this facility is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p>
Stanard, Barbara	I-188	Refer to Appendix T Page DEIS C–1833 for your exact comment.	<p>Thank you for your comment regarding noise levels. Noise analysis for a project such as this, is required as part of the National Environmental Policy Act (NEPA) of 1969 and the Federal-Aid Highway Act of 1970. MDOT SHA developed a Highway Noise Abatement Planning and Engineering Guidelines to provide detailed implementation guidance, critical background information, rationale, and other comprehensive criteria associated with a highway noise study. The noise policy and guidelines are based upon the provisions contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), Procedures for Abatement of Highway Traffic Noise and Construction Noise and the Federal Highway Administration (FHWA) report FHWA-HEP-10-025, Highway Traffic Noise: Analysis and Abatement Guidance and subsequent revisions. The conclusions of the noise analysis are as described in the Supplemental DEIS and the supporting Noise Analysis Technical Report Addendum.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p>
Stanish, Julie	I-52	Refer to Appendix T Page DEIS C–1834 for your exact comment.	<p>Thank you for your comment concerning traffic exiting the HOT lanes onto Connecticut Avenue. Commenter	#	Reference to Comment	Response
Stolz, Robert	I-26	Refer to Appendix T Page DEIS C–1851 for your exact comment.	<p>Thank you for your comment concerning traffic projections. Table 5-6 in the Traffic Technical Report (DEIS Appendix C) which shows that the travel time along I-270 northbound between I-495 and I-370 is projected to be 10 minutes for the No Build condition, compared to 12 minutes that was projected for Build Alternative 9. Although this appears to indicate that No Build performs better than the Build alternatives, these results are influenced by two external factors:</p> <p>First, in the No Build condition, traffic accessing I-270 northbound would be stuck in congestion elsewhere in the network, such as at the American Legion Bridge and on the surrounding local network, which limits the number of vehicles that reach I-270 northbound during the PM peak hour in the 2040 No Build model. Without this effect (known as "metering"), travel times in this section would be higher (14 minutes) under No Build conditions.</p> <p>Second, in the Build condition, downstream congestion on I-270 northbound from the existing lane drop north of MD 121 creates vehicle queues back into the study corridors. The northern section of I-270 from north of I-370 to I-70 is part of a separate, independent National Environmental Policy Act (NEPA) study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under the I-495 and I-270 Managed Lanes Study. If these improvements are completed by the design year, travel times along I-270 northbound between I-495 and I-370 would be lower (10 minutes) under Build conditions.</p> <p>Therefore, the results shown in Table 5-6 in the DEIS Traffic Technical Report are not an indication that traffic will get worse under the Build alternative. When reviewing the results from a broader perspective (rather than focusing on travel times in one segment during one peak period that are influenced by external factors), the Build alternatives provide clear operational advantages.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p>
Stoner, Andrew	I-902	Refer to Appendix T Page DEIS C–1856 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p>
Stumpf, Richard	I-232	Refer to Appendix T Page DEIS C–1857 for your exact comment.	<p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p>
Sturm, Anne	I-687	Refer to Appendix T Page DEIS C–1858 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Su, Sam	I-900	Refer to Appendix T Page DEIS C–1859 for your exact comment.	<p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>
Sugasawara, Renee	I-638	Refer to Appendix T Page DEIS C–1860 for your exact comment.	<p>MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p>

Suh, James	I-1093	Refer to Appendix T Page DEIS C–1861 for your exact comment.	Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.
Suit, Verna	I-1098	Refer to Appendix T Page DEIS C–1862 for your exact comment.	Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.
Sullivan, Benjamin	I-822	Refer to Appendix T Page DEIS C–1863 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Sullivan, Eva K	I-736	Refer to Appendix T Page DEIS C–1864 for your exact comment.	Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Summerville, Carolyn	I-1394	Refer to Appendix T Page DEIS C–1865 for your exact comment.	Thank you for your comment concerning impacts to your property. As described in the Supplemental DEIS, your property is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation. Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality. Refer to Chapter 9, Section 3.4.L for a response to public health impacts. Refer to Chapter 9, Section 3.4.I for a response to construction impacts. Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost. Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.
Sumner, Louise	I-773	Refer to Appendix T Page DEIS C–1866 for your exact comment.	Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.

			Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Tablada, David	I-1178	Refer to Appendix T Page DEIS C–1873 for your exact comment.	MDOT SHA and FHWA appreciate your comment on the proposed action. As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS. Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.
Tabor, Brenda	I-5	Refer to Appendix T Page DEIS C–1874 for your exact comment.	Thank you for your comment concerning local community impacts in the Woodley Gardens neighborhood. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements. The proposed limits of disturbance at the Woodley Gardens Shopping Center along northbound I-270 north of the MD 28 interchange encompass a portion of the shopping center parking lot adjacent to I-270. The parking lot is a character-defining feature of the shopping center, but impacts will be limited to several parking spaces along the edge of the lot. The property impacts to the shopping center would be required to accommodate utility relocations and the construction of a retaining wall and noise barrier.
Tabor, Brenda	I-597	Refer to Appendix T Page DEIS C–1875 for your exact comment.	Thank you for your comment concerning impacts to the Rockshire and Woodley Gardens communities. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements. The proposed limits of disturbance at the Woodley Gardens Shopping Center along northbound I-270 north of the MD 28 interchange encompass a portion of the parking lot adjacent to I-270. The parking lot is a character-defining feature of the contributing shopping center, but impacts will be limited to several parking spaces along the edge of the lot. The impacts to the shopping center would be required to accommodate utility relocations and the construction of a retaining wall and noise barrier. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.
Taft, Camille	I-1227	Refer to Appendix T Page DEIS C–1876 for your exact comment.	Thank you for your comment concerning impacts to Rock Creek Park, Sligo Creek Park and Greenbelt Park, and the Silver Spring YMCA. As described in the Supplemental DEIS, these parks and community facility are located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies. Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study. Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost. Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process. Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources. Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management. Refer to Chapter 9, Section 3.4.L for a response to public health impacts. Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working. Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities. Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs. Refer to Chapter 9, Section 3.4.I for a response to construction impacts.

As a result of the NEPA process, including consideration of all public, stakeholder and agency comments concerning the project, MDOT SHA and FHWA have identified Alternative 9 Phase I South as the Preferred Alternative giving consideration to economic, environmental, technical, and other factors as detailed in the SDEIS and FEIS.
Toyoda, Yusuke	I-1549	Refer to Appendix T Page DEIS C-1938 for your exact comment.	<p>Thank you for your comment on traffic impacts, public engagement, . MDOT understands the phenomenon of induced demand, and it is a consideration on all of our large roadway projects. In this case, MDOT is recommending adding capacity via managed lanes (HOT lanes) instead of widening with additional general purpose lanes. Managed lanes do a better job at regulating demand, including induced demand, due to dynamic pricing.</p> <p>Our study shows that there could be some induced demand as a result of this project, but the impact will be small (less than 1% increase in vehicle miles traveled</p>

Commenter	#	Reference to Comment	Response
Vaghi, Nino	I-1523	Refer to Appendix T Page DEIS C–1983 thru 2073 for your exact comment.	<p>Thank you for your comment on the Study. The Park-n-Rail solution presented is well developed and potentially an additional innovative solution to traffic congestion in the region. However, the Park-n-Rail solution does not meet the same needs proposed by this Study. The Study’s alternatives development process evaluated a variety of rail and transit only solutions and determined that a combination of highway and transit improvements would be needed. A review of the MLS FEIS, especially those chapters discussing the Study’s Purpose and Need, consideration of transit-only alternatives, supporting traffic and air quality analysis results, and costs addresses the issues presented.</p> <p>The Park-n-Rail assumes expansion of the existing Metro Red Line and expansion of future Metro lines. Communities along the I-270 corridor are currently served by the Washington Metropolitan Area Transit Authority (WMATA) Metro Red Line and the MARC Brunswick Line. The Red Line Metro alignment follows MD 355 with five stations north of I-495. The Red Line also crosses I-495 at MD 97 with three stations north of I-495. The MARC Brunswick line includes five stations north of I-495 within the study corridors and continues north into West Virginia. The MARC Brunswick Line is generally parallel to MD 355 to the east.</p> <p>Recently, the state reviewed existing MARC Service on the Brunswick Line as part of the development of the MARC Cornerstone Plan. This effort sought input from each of the regional transit stakeholder groups, to define strategic priorities, policies, programs, and initiatives for MARC Service. The stakeholders provided their observations and suggestions about ways in which existing transit services may benefit from the P3 Program. Discussion also included new transit service concepts, potential access points, and constraints. Montgomery County identified as one of the service concepts, several enhancements to the MARC Brunswick Line, including bi-directional AM and PM service, more trips to the schedule, and mid-day trips between Germantown and Washington Union Station. The group reviewed MARC Brunswick Line capacity improvements contained in the MDOT MTA’s MARC Cornerstone Plan.</p> <p>However, for purposes of satisfying this Study’s Purpose and Need, implementation of this option is severely constrained as a result of several practical engineering and fiscal realities. Current MARC service is experiencing capacity limitations in terms of the number of through tracks, size of platforms, station infrastructure, and the number of rail cars. The MARC Brunswick Line operates on freight tracks owned by CSX. CSX will not allow the state to increase commuter rail service without adding a third main line track. The MDOT MTA’s Cornerstone Plan identified \$1.3 billion in capital investments necessary for increased service on the Brunswick Line. See MDOT MTA MARC Cornerstone Plan: https://s3.amazonaws.com/mta-website-staging/mta-website-staging/files/Transit%20Projects/Cornerstone/MCP_MARC.pdf) For these and other reasons, this option was not carried forward for detailed analysis.</p> <p>General Traffic Response</p> <p>From an operational perspective, Park-n-Rail claims to be able to reduce vehicular travel in the region. However, the estimated 200,000 vehicles per day would need to travel to and from the Park-n-Rail garages and would therefore still be traveling on roads throughout Maryland and Virginia, including I-495 and I-270. In fact, under this proposal, vehicular demand would be even higher on the interstates near the proposed garage facilities. Without capacity improvements on these interstates, congestion approaching the garages would increase. Therefore, the claims of savings in fuel and emissions are questionable. The proposal also assumes that all commuters have a destination along a Metro line and an origin near one of the five garages. However, the population is spread out all over the Washington, D.C. metro region, making it inconvenient for many commuters to travel to the garages.</p> <p>The proposal promotes the notion that it would be “100% paid for by users, not taxpayers.” This is similar to the concept of the MLS Preferred Alternative; however, it does not address the upfront funding necessary for construction of the proposed facilities and additional rail cars. Construction of the Managed Lanes would be financed by a private developer as part of a Public-Private-Partnership, who would recover the costs through tolling revenue from the users of the system. The general purpose lanes would remain free to use and taxpayer money would not be used.</p> <p>The Park-n-Rail proposal is geared almost exclusively towards commuters. With increases in teleworking accelerated by the pandemic, demand for home-to-work trips is reducing, while other trip types, such as recreational trips, have rebounded. Commercial and delivery vehicles have remained steady or increased throughout the pandemic. Overall, daily vehicle miles traveled (VMT) have rebounded to near pre-pandemic levels. The Managed Lanes project will serve all trip types, not just work commutes.</p> <p>Another impact of the COVID-19 pandemic has been the reduction in use of transit systems, particularly rail. Transit agencies are seeing fewer riders, reduced revenues, and are being forced to cut service. For the Park-n-Rail proposal to be successful, the opposite would be required - a significant increase in Metro demand and capacity.</p>

Commenter	#	Reference to Comment	Response
			<p>Specific Traffic Related Responses to Claims in the Report</p> <p>On page 3, it is suggested that the Beltway could be widened to 20 lanes, but there is no source or explanation how this number was generated. This is wild speculation that has never been suggested by MDOT or any other agency. There are no plans to widen the Capital Beltway beyond the 2 managed lanes in each direction proposed under the Traffic Relief Plan.</p> <p>On page 7, we concur that Marylanders are spending too much time and money in bumper to bumper traffic burning fuel and traveling at extremely low speeds. The Preferred Alternative will reduce congestion throughout the region and increase travel speeds for all users, including free flow speeds in the managed lanes. This also encourages the use of HOVs and ridesharing by allowing HOV-3+ vehicles and transit buses to use the managed lanes without paying a toll.</p> <p>There are points of agreement and disagreement with the report. On page 8, we disagree with the assertion that adding 2 new lanes to the Beltway will “do nothing”. On the other hand, on page 9, the text appears to acknowledge the potential for increase speeds on the Beltway as a result of the project. The results indicate that the Preferred Alternative will provide meaningful benefits to the system, including reducing average delay by 18% during the AM peak period and by 32% during the PM peak period, increasing the average speed in the general purpose lanes by an average of 5 mph throughout the study area during the peak periods, increase throughput across the American Legion Bridge by up to 30% during the peak hours, and reducing daily delays on the local roadway network by 3.5% compared to the No Build.</p> <p>Also on page 8, the text suggests that the additional capacity will be immediately filled with 1) new commuters, 2) commuters that are currently using back roads to get to and from work, and 3) non-commuters who ignored using the Beltway at rush hour. Let’s address each of those three groups individually. First, “new commuters” come from land use decisions, such as the construction of new office buildings on Wisconsin Avenue as discussed on page 9. This project will assist in MDOT SHA’s mission to provide a safe, well-maintained, reliable highway system that enables mobility choices for all customers, including existing and potential new commuters from planned developments. Second, commuters that are currently using back roads to get to and from work are part of the problem. Moving these commuters off the local roads and onto the interstate highway system is one of the benefits of the project. Similarly, another benefit of the project is to provide additional options and opportunities for non-commuters that are unable to use the Beltway because it is congested and unreliable under existing conditions. While some of this traffic will shift over to I-495 and I-270 due to the additional capacity, the extra traffic will not fill these roads completely, and therefore there will be operational benefits for all users, as summarized above.</p> <p>Page 8 also suggests that more cars will exit the Beltway onto Georgia Avenue, Connecticut Avenue, Wisconsin Avenue, and New Hampshire Avenue. The Preferred Alternative includes no action or no improvements at this time on I-495 east of the I-270 spur to MD 5 in Prince George's County. See Figure 1-1 in the Supplemental DEIS on pg. 1-2. The potential impacts raised in your comment had been identified in the DEIS related to build alternatives that would have spanned the entire study area. However, widening adjacent to the roads listed is no longer included in this project. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies. As noted on page 9, volumes along Connecticut Avenue will be essentially unchanged as a result of the project.</p> <p>On page 10, the text acknowledges that commuters who can afford paying tolls will enjoy a quick ride to work (another benefit), but incorrectly assumes that “everybody else will ... take longer to arrive at their final destination.” The results of the study indicate that transit bus users, HOV-3+ users, most motorists using the general purpose lanes, and most motorists using the local roads will also see reduced travel times.</p> <p>In sum, the Park-n-Rail proposal presents some valuable information and innovative concepts that may be worthy of consideration addressing a unique sub set of the region’s transportation problems, however, it does not adequately address the set of goals and needs of the Study.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need.</p> <p>Refer to Chapter 9, Section 3.2.A for a response on Screening of Preliminary Alternatives Process.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p>

Commenter	#	Reference to Comment	Response
Wald, Hannah	I-467	Refer to Appendix T Page DEIS C–2101 for your exact comment.	<p>Thank you for your comment concerning impacts to your property. The Preferred Alternative, as described in the Supplemental DEIS, does not result in any full acquisitions or residential or business displacements; therefore, no homes would be taken due to the proposed roadway widening. Sliver impacts to properties along I-270 are proposed for elements such as roadside grading, on-site drainage and stormwater management, and noise barrier replacement/construction. These partial property acquisitions are considered ones that do not cause a business or residential relocation and have been assumed where a principle building of a residence, business, or community facility is located more than 20 feet from the Preferred Alternative limits of disturbance.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need, effects of the Pandemic, and impacts of teleworking/remote working.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.4.E for a response to impact analysis and mitigation of water resources, including wetlands, waterways, and stormwater management.</p>

Commenter	#	Reference to Comment	Response
Warner, Steve	I-4	Refer to Appendix T Page DEIS C–2115 for your exact comment.	<p>Thank you for your comment concerning impacts to parkland and the National Park Seminary. As described in the Supplemental DEIS, this resource is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p> <p>Regarding your comment on I-270, the northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p> <p>Regarding your comment on support for improvements to the American Legion Bridge, the Preferred Alternative includes the full replacement of the American Legion Bridge on I-495 spanning the Potomac River with a new, wider bridge on the existing centerline. Engineering design details including the grade of the new bridge will be determined as the Study progresses. The existing bridge is nearly 60 years old and would need to be replaced regardless of the outcome of this Study. The new bridge would also need to be constructed to maintain the existing number of travel lanes at all times.</p>
Warner, Steve	I-499	Refer to Appendix T Page DEIS C–2116 for your exact comment.	<p>Thank you for toy comment regarding a second Potomac River crossing. The Preferred Alternative includes the full replacement of the American Legion Bridge on I-495 spanning the Potomac River with a new, wider bridge on the existing centerline. The existing bridge is nearly 60 years old and would need to be replaced regardless of the outcome of this Study. The new bridge would also need to be constructed to maintain the existing number of travel lanes at all times. The new American Legion Bridge will include a pedestrian and bicycle lane connecting Virginia and Maryland.</p> <p>Refer to Chapter 9, Section 3.3.D for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>

Wetterhahn, Mark	I-22	Refer to Appendix T Page DEIS C–2133 for your exact comment.	<p>Thank you for your comment concerning redactions in the cultural resources technical reports. Section 304 of the National Historic Preservation Act requires withholding information from the public regarding the location, character, or ownership of historic properties that may risk harm to the resource. MDOT SHA redactions are made in compliance with this requirement intended to protect the resources. MDOT SHA recognizes the importance of protecting and preserving this resource and awareness of its historical significance. MDOT SHA is proposing a cemetery treatment plan based upon a thorough investigation of areas proposed for construction disturbance in the vicinity of the Montgomery County Poor Farm, as part of compliance with Section 106 of the National Historic Preservation Act.</p> <p>Refer to Chapter 9, Section 3.4.C for a response to analyses of parklands and historic resources.</p>

Whittemore, Alan	I-1320	Refer to Appendix T Page DEIS C–2143 thru 2144 for your exact comment.	<p>Thank you for your comment regarding public participation and environmental impacts. For your comment regarding Rare, Threatened, and Endangered Species, the project team coordinated closely with MDNR and USFWS for all state and federal listed species within the project corridor. Coordination with MDNR and NPS resulted in the project team conducting a RTE plant survey within the portions of the project corridor that are within the Potomac Gorge in 2020 throughout the flowering periods of the listed species. The results of this coordination are included in the DEIS and SDEIS and their appendices. The discussion of Rare, Threatened, and Endangered Species is included in Section 4.19 of the DEIS and this discussion is expanded upon in the Natural Resources Technical Report (NRTR), which is an appendix of the DEIS. The revised NRTR is appended to the FEIS and includes updates to the RTE section of the original NRTR for the Preferred Alternative.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.J for a response to impacts to greenspace and/or wildlife habitat.</p>

Zenzen, Joan	I-1128	Refer to Appendix T Page DEIS C–2195 for your exact comment.	<p>Thank you for your comment on the I-270 Pre NEPA study. The northern section of I-270 from I-370 to I-70 is part of a separate, independent planning study under the I-495 and I-270 Public-Private Partnership (P3) Program. We recognize that improvements are needed in the northern section of I-270 with or without the improvements being considered under this project, however, MDOT SHA has prioritized improvements that will address the major regional congestion at the American Legion Bridge.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.F for a response to adverse impacts to air quality.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.1 for a response on Purpose and Need and effects of the Pandemic.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p>
Zhang, Huiyan	I-862	Refer to Appendix T Page DEIS C–2196 for your exact comment.	<p>Thank you for your comment concerning interchange operations and signal timing. Interchange operations, including signal timing at nearby intersections, are being evaluated in more detail as part of the FEIS, and mitigation will be proposed where needed to maintain acceptable operations per FHWA Interstate Access Point Approval guidelines.</p> <p>Refer to Chapter 9, Section 3.3.A for a response to Analysis of Alternatives Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.H for a response to noise impacts and mitigation.</p> <p>Refer to Chapter 9, Section 3.4 for a response on the NEPA approach, analysis, and impacts.</p> <p>Refer to Chapter 9, Section 3.4.K for a response to impacts to properties and communities, including community facilities.</p>
Zhang, Yinan	I-1157	Refer to Appendix T Page DEIS C–2197 for your exact comment.	<p>Thank you for your comment concerning impacts to your community including the Silver Spring YMCA and Montgomery Blair High School. As described in the Supplemental DEIS, this area is located outside the Preferred Alternative limits of build improvements and impacts have now been completely avoided. See Figure 1-1 in the Supplemental DEIS on page 1-2. Any future proposal for improvements to the remaining parts of I-495 within the study limits, outside of Phase 1 South, would advance separately and would be subject to additional environmental studies, analysis, and collaboration with the public, stakeholders, and agencies.</p>

Zwack, Bill	I-899	Refer to Appendix T Page DEIS C–2211 for your exact comment.	<p>Thank you for your comment concerning autonomous vehicles. The expected influx of connected and autonomous vehicles (CAVs) will impact future traffic operations on all roads in Maryland, including I-495 and I-270. MDOT SHA participates in a statewide CAV working group (https://mva.maryland.gov/safety/Pages/MarylandCAV.aspx) to stay up to date on the latest research and industry projections. At this time, there are too many unknowns regarding how CAVs could affect demand and capacity to include CAVs directly in the traffic forecasts. Capacity will likely increase as vehicle spacing decreases, but the magnitude of the capacity increase is difficult to quantify based on the current research. Also, the benefits of more vehicles per lane may be offset by a potential increase in demand on the transportation network for some types of auto trips, including "mobility as a service" trips (people that can't afford their own car, but could call an autonomous vehicle for a solo trip) and "deadhead" trips (trips where the autonomous vehicle is empty, traveling to a parking lot or to the next</p>

Commenter	#	Reference to Comment	Response
			<p>pickup point). Therefore, the traffic projections for this Study apply traditional forecasting techniques, while being cognizant of the potential CAV impacts. However, it is anticipated that this project will be adaptable to accommodate CAVs because the proposed managed lanes will create a controlled environment with physical separation, new pavement, and clear delineations, features that are conducive to CAV use.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p> <p>Refer to Chapter 9, Section 3.4.B for a response to traffic modeling and analysis.</p> <p>Refer to Chapter 9, Section 3.6.B for a response to toll rate ranges and toll rate setting process.</p> <p>Refer to Chapter 9, Section 3.5 for a response to the P3 Program and Project Cost.</p> <p>Refer to Chapter 9, Section 3.4.M for a response to impacts to utilities and associated costs.</p> <p>Refer to Chapter 9, Section 3.2.B for a response to Alternatives Not Retained for Detailed Study.</p>

T.6.A.2 Draft Environmental Impact Statement Individual Comments

Devota Aabel

I oppose the I-495 and I-270 project. I support the no-build option. I disapprove of the environmental impact. Also, it has been proven widening roads only alleviates traffic temporarily, so this in no way justifies the extreme cost and disruptions of widening the roads. We need more sustainable options.

Wendy Aaronson

I am Wendy Aaronson. I am a Rockville resident who lives in the College Gardens neighborhood. Prior to retirement three years ago, I commuted to White Oak by bicycle and bus.

I strongly oppose the project to widen I-495 and I-270. I support the no build option. The proposed project to widen I-495 and I-270 will have significant adverse impacts on the environment that the Draft Environmental Impact Statement (DEIS) for the I-495 & I-270 Managed Lanes Study fails to take into account. Furthermore, there is too much uncertainty regarding the impact that the COVID-19 pandemic will have on the future of traffic in our region. It is possible and highly likely that telework will reduce the traffic sufficiently to make this project unnecessary.

The DEIS is deficient in many areas, but I would like to focus on the effects on the Rockville stormwater management and the watershed area, specifically Watts Branch and Fallsmead Stream. Watts Branch parallels I270 from around Shady Grove Rd to Rt 28 and then it goes underneath I270. Fallsmead Stream branches off of Watts Branch and is very near I270. Both watershed areas are greenways with hiking and biking trails. I moved to this neighborhood 22 years ago because of its proximity to a neighborhood forest reserve and Rockville's commitment and reputation for going beyond federal, state and county requirements for development and environmental controls. The City of Rockville has spent millions of dollars in recent years to restore the streams and reforest the areas after years of stormwater destruction undoubtedly caused by development and increasingly severe storms. Now, our beloved neighborhood forest park is no longer scared by frequent flooding of Watts Branch and muddy conditions and there is a beautiful marked trail developed as part of an Eagle Scout project. The neighborhood even comes together several times a year to remove invasive species and clear debris.

The DEIS addresses Watts Branch so it will clearly be affected. As I understand it, the DEIS addresses stormwater management within the Limits of Disturbance (LoD), but it fails to address areas beyond or downstream. We know flooding will be a significant issue because of the severity of storms which will continue to worsen due to climate change and the increase in impervious surfaces after the build. A larger culvert is not an acceptable solution. In general, the DEIS fails to sufficiently address how degradation to any of the named waterways and wetlands will be mitigated. The DEIS refers to wetland mitigation and wildlife mitigation credits to mitigate this degradation. It seems unconscionable to give a project a free pass to destroy a stream or wetland where a project is located because there was success in another area.

The concerns about Watts Branch apply to all of the watershed areas affected by this project. Each individual in every neighborhood is undoubtedly concerned like me. It is very unclear how MDOT can proceed with a project that adversely affects so many people for so little gain.

The DEIS fails to address multi-modal transit alternatives that do not require any build. Possible solutions include all day train service on the MARC Brunswick line, Bus Rapid Transit between Frederick and Rockville or between Maryland metro stations such as Rockville or Bethesda and Virginia metro stations such as Tysons Corner or Falls Church.

I believe this pandemic has taught us that our quality of life is vastly improved when we can work and play within our neighborhood. If telework becomes the norm, the state should worry about businesses moving out of leased buildings and departure of a tax base instead of damaging the environment and scarring the landscape to build toll lanes to accommodate traffic that does not exist.

I urge MDOT to take a step back and reevaluate the need for this project and consider other solutions that will not adversely affect our environment and health.

Sincerely,

Wendy Aaronson

**Maryland Department of Transportation
State Highway Administration
1-495 & I-270 P3 Office
Re: I-495/I-270 Beltway Expansion**

I write to you as both a Bethesda resident who lives within a mile of I-495 at the East-I-270 spur Interchange to MD355 south, and as a community leader with extensive service on road project advisories and in transportation planning participation (Chair, Bethesda BRAC SHA projects Integration Committee, MD355 BRT CAC member; Chair, WMCOG's Transportation Planning Board CAC, TPB CAC Alternate Delegate to the COG Visualize2045 Task Force.

I support the No-Build Alternative because I do not agree with *any* of the current alternatives, and, because of regional travel and land use transformation underway that is being accelerated by Covid-19 pandemic. Maryland also must first address the Purple Line/P3 debacle which has evidenced tangible risks and pitfalls to citizens, communities, and businesses imposed by P3 Design/Build/Operate contracts.

Of equal concern:

- a. The proposed I-495/I-270 project contradicts long range transportation plans adopted by directly impacted jurisdictions and the WMCOG region. Visualize2045, the TPB's that repositioned LRP positions the region to remediate traffic congestion by revised land use, multi-modal transit, and non-motorized transportation solutions as opposed to highway widening, which has proven to induce further demand and increase VMT;
- b. The project's DEIS omits or incompletely studies critical environmental impacts to multiple categories of regional assets, increased GHG emissions, noise pollution, and poses grave loss of remaining parkland and tree canopy in rapidly urbanizing sectors, among multiple additional negative impacts cited by multiple Montgomery County planning and governing entities;
- c. The plan lacks transparency about hidden steep increases of monthly infrastructure fees to all regionwide taxpayers (including low income populations) plus profound interruptions of these services to families and businesses, for the project's relocation of critical infrastructure. As cited on October 28, 2020 by Maryland Matters, those elements include Water and Sewer Service, Electricity, Gas, and Telecom. This belies Governor Hogan's promise that this project as having no cost to citizens. This revelation, combined with the Purple Line P3 having imploded, makes this project proposal misleading and indefensible.
- d. Impacts to Maryland's citizens and economy from Covid-19 are still unfolding with no definable end; this demands a reevaluated Purpose and Need to be performed for potentially long-term travel and societal transformations. Governor Hogan should first help his struggling citizens and "Main Streets" deal with Covid impacts before embarking on a poorly studied highway with a risky P3 contract that incurs uncalculated costs to taxpayers during what might become be a Global Depression.

As a resident on a main road (MD355) just beyond the I-270 East Spur Interchange (L), I particularly object to the already insufficient environmental impact studies bearing on health concerns. I am further alarmed by the lack of guaranteed NEPA-equivalent accountability for health impacts from Interchange L redesign under a P3 arrangement.

The P3 contract would allow the contractor to implement radical interchange alterations, including elevated Fly Ramps, that the DEIS neither succinctly defines nor visually illustrates. The contractor would not be obligated to equal NEPA-required accountability for public engagement with area residents for use to learn of or weigh in on Alternatives.

- Charts from in project's DEIS already indicate increased emissions from Interchange L to MD 355 and the local road network but fails to calculate increased GHG health impacts combined with existing MD355 emissions. This is MoCo's main arterial and main local route for SOVs and heavy commercial vehicles. The project would amplify air quality compromise further by tree buffer removals and Rock Creek parkland loss.
 - Widening is proven to increase VMT, traffic congestion, and GHG emissions in the short and long runs by a 1:1 relationship between increased lanes and increased traffic, with failure by highway planners and DOTs to incorporate this proven fact into modeling for design or environmental impact analysis. As notable, this project conflicts with TPB's Air Quality Conformance Analysis recordation and projection of increased GHG emissions; rendering this project hypocritical for Maryland, a leading member of TCI, the 12 state Transportation and Climate Initiative consortium formed to reduce this sector's GHG emissions.
 - Air and Noise Pollution are especially health concerns because my community, just outside the study area, already hears constant Beltway hum, overpowering MD355 noise, plus noise from Metrotrains emerging from below ground, plus helicopters, ambulances, and fire engines from local stations, NIH, and Walter Reed. My street, from previous NEPA documentation, already has an un-remediable ambient decibel level of one point short of dangerous.

Traffic Concerns: Insufficient study was performed for impacts to local road networks, which, as applies my home and community, is directly along MD355.

- This DEIS's egregious traffic analysis omission, which should have formed the study's fundamental basis, was identification of trip originations and destination around 495 (and/or) as contiguous with I-270, for both peak and off-peak travel. This makes the project an overkill solution for undefined root problems. Rather than blanket expansion, the project should have parsed, for example, specific problem areas such as merges and bottlenecks, to identify easier-to-achieve localized solutions such as:
 - Repurposing during peak hours and traffic flow of mainline I-270 center HOV lanes into two reversible managed lanes--as per MoCo request. From empirical "reverse commuting" experience, I can attest that the flow side opposite of peak direction is typically empty and fast moving, and is currently wasted space.
 - Employing Transportation Technology at my locale of Interchange L, the East I-270 Spur, instead of adding lanes and air and noise polluting fly ramps.

This project contradicts the region's Visualize2045 Long Range Plan and Performance-Based Planning and Programming, despite claims otherwise. TPB states because we can no longer build our way out of congestion, Visualize2045's Initiatives are:

1. **"Bring jobs and housing Closer Together":** This is diametrically opposed by this project's Purpose & Need to increase commuting distance in constant time span to reach farther away jobs. WMCOG TPB jurisdictions have rather committed to (WMCOG's Housing Initiatives and Targets) increasing affordable, Transit-Oriented Housing closer to job centers and High Capacity Transit Stations for shorter commutes, greater transit assess and reduced congestion, while expanding local economies.
 - The proposed project is outmoded because it does not fit the evolved, current layout of the region. Over the past decades, the region's buildout and travel network have shifted by market forces and design from Wheel/Spoke to densified infill sub-areas around the inner core and throughout the suburbs, including Activity and Town Centers. These hubs feature residential, retail, employment, and transit access that have reduced the need for local or highway driving.
 - This highway expansion project directly contradicts MoCo's state of the art, best practice, land use and transit-focused smart growth, anti-sprawl Master and Sector Plans and "Thrive 2050" General Plan to prevent further (and farther) suburban sprawl and to reduce regional emission levels.
2. **"Expand bus rapid transit and transit ways.":** This plan fails to realize Visualize2045's intent to prioritize highways use of commuter/express buses. The project also opposes Montgomery County's comprehensive BRT Plan already undergoing implementation. And if successfully completed, Purple Line will travel parallel to I-495, lessening car use and traffic congestion. Moreover, the region's business community has identified local buses and BRT as the modes most critical to sustain regional economic success and make jobs most equitably accessible and affordable. In response, WMATA's Bus Transformation Project serves to bring this to fruition in terms of both local and interjurisdictional access, and more inclusively than this project.
3. **Move more people on Metrorail":** Maryland and the other states, during and after the pandemic, must prioritize Metrorail before road projects especially to preserve, fix, and enhance Metrorail; Metrotrains are the backbone of travel in this region for residents, workers, and the tourism industry. Metrorail cries out for state of good repair and expansion to continue to serve the region and all its demographic

populations--especially Equity Emphasis area communities of low-income minority populations who rely on it for personal needs and to reach work or education.

- As cited by Carol S. Rubin, Special Project Manager I-495 & I-270 Managed Lanes Study, Montgomery County Council, in her June 8, 2020 report, this project's "DEIS does not sufficiently address impact to economically challenged populations or social equity as required under NEPA."
- In response to inequities made more obvious by Covid-19 and exposed Systemic Racism, WMCOG TPB adopted TPB R1-2021, the *Resolution to Establish Equity as a Fundamental Value and Integral Part of All Transportation Planning Board Activities*. This project's DEIS also failed to fulfill this Resolution's call for public outreach to all populations or assurance of related historic preservation.

4. **"Increase telecommuting and other options for commuting"**: This project contradicts TPB presentation by Chair Kelly Russell to the Maryland House of Delegates Transportation & The Environment Committee in August, 2020 calling for a Maryland State Initiative on Travel Demand Management as supported by the following evidence:

- A small percentage of teleworkers reduces workday commute trips by as much as 10%; Increased telework would further and greatly reduce traffic congestion.
- A Maryland statewide incentive would encourage telework by Maryland private and government workers. (Currently only 14% of state and local government workers telework, but half of all federal workers already telework.)
- 60% of all commuters reported having telework-suitable jobs, with 59% percent already teleworking one or more days per week.

Cited in TPB's *Commuter Connections 2020 Employer Telework Survey*:

- Productivity benefits from and readiness for telework by 80% of companies, with 61% percent already having telework policies and 62% expanding them.
- 97% of worksites had some telework pre-pandemic, and more than half of worksites anticipate a higher post-pandemic telework level, this region being one of the nation's metro areas that went most quickly and easily to telework by nature of much area employment.
- 92% of employees report benefits of working of home by not having to commute, including increased productivity, more comfortable environment, more personal savings, better work-life balance, and reduced stress.

5. **"Expand the express highway network"**: This does not require, advocate, or mandate width expansion. Rather, the intent is to institute high occupancy express lanes that may or may not be tolled or congestion-priced, and to add commuter buses in these lanes.

6. **"Improve Walk and Bike Access to Transit"**: This DEIS makes no provision to enhance safety, improve access, or prevent disruption to or loss of existing paths.

7. **"Complete the National Capital Trail"**: Even before Covid-19, for health and environmental reasons more people are biking to work or on personal trips, lessening car trips. This mode has grown rapidly as result of Covid. The National Capital Trail identifies how to travel inside and around the combined Washington Metropolitan and suburban bike networks. As cited by Carole Rubin in her MoCo County Council report, this project's DEIS omits "bike and ped crossing in its design for better connectivity to transit and to break down the barriers to local communities created by I-495 and I-270

- I grew up in 1960's New York, where Robert Moses' highway projects made bike and ped travel impossible. It also destroyed entire Boroughs (notably the Bronx) by physically dividing them and communities. That is what happens when Transportation becomes more about cars than about people. Thus, this project contradicts all that has been learned and is in the process of now being corrected here and throughout the nation. Maryland should not go backwards.

In conclusion and compliance with TPB's Visualize2045 LRP 2022 Update, there needs to be research and consideration of Covid-related travel and commuter impacts. This necessitates shelving this retrogressive project and reexamining its Purpose & Need when recommenced to capture changed conditions and societal transformations, updated and full calculations of all costs, and to include initially absent participatory collaboration with government and planning departments of impacted jurisdictions.

Thank you for the opportunity to comment.
Most Sincerely,

Nancy Abeles

we oppose these plans.

Sent from my iPhone

Allison Abramson

I oppose the I 495 and I270 project. I don't think it is necessary to expand the highway, especially with so many people now converting to telecommuting. It will create more traffic and environmental damage than it is worth.

I support the no build option.

Linda Adams

Good afternoon,

I oppose the I-495 and I-270 project. I support the no-build option. I do feel as we strive for equity in our county, creating tolls will negatively affect those with the least resources but the most need. I am concerned as to how this would affect my neighborhood and the environment as a whole (air, water, noise pollution -- negative impact on parks, native habitat & waterways). I do not feel that tolls collected come back in any way to support the county or its infrastructure.

Sincerely,
Linda Adams

Proposed Expansion of the
American Legion Bridge

Testimony by
Lowell Adams
Columbia, Maryland
November 7, 2020

Dear MDOT Officials:

Thank you for the opportunity to comment on this draft environmental impact statement (EIS). I am **OPPOSED** to the highway expansion project, including the American Legion Bridge expansion part. I support the **NO BUILD OPTION**. None of the other alternatives presented in the draft EIS are acceptable to me.

I have been an active member of the Washington Biologists' Field Club (WBFC) since 1984, and I know the WBFC has submitted detailed comments. I hope you will give them due consideration. Plummers Island is unique. The research conducted on the Island by WBFC members and others has been, and continues to be, of international significance to science. In my opinion, Plummers Island is as valuable as any of the museums in Washington, D.C. and it should be recognized as such.

The draft EIS reflects a lack of understanding or recognition of the value of the extensive historical and ongoing biological research on Plummers Island and the WBFCs 120 years of contributions and commitments to that. Records of many rare plants, animals, and habitats on the Island were not considered.

Because the draft EIS analysis is incomplete, it is impossible for the concerned agencies to assess, and the public to comment on, the proposed project's impacts. The agencies cannot wait until a final EIS is complete to analyze the project's full impacts, as it will then be too late for the public to meaningfully comment on them and for the agencies to consider the public's comments and choose the alternative that best alleviates the impacts based on this information. We respectfully request that the agencies conduct a supplemental EIS to provide the public the ability to meaningfully review and comment on the impacts before a final EIS is produced.

The Draft EIS is seriously flawed in many ways. The most pertinent to the WBFC is the failure to discuss and evaluate the impact of the destruction of part of Plummers Island, a historical and biological treasure within the Chesapeake and Ohio Canal National Historical Park.

Miranda Adams

The impact of expanding I-495 is going to cause not only harm to the environment but force many who live along the beltway be forced from their homes. There is no need to expand I-495 or I-270. If you really want to reduce traffic, find another means to increase public transportation so people would not be forced to drive. During a time where people are spending more time at home due to the pandemic, people do not need to worry about having to be forced out of their homes because the state government has decided to expand a major highway instead of looking at other means to ease traffic. After the pandemic, people might still be working from home which means that expanding the highway would be a waste of government funds. Virginia expanded their section of I-495 with ridiculously priced toll lanes that are hardly used. If MD goes forward with expanding I-495 and I-270, it will just be expensive toll lanes that aren't used and no one in the areas want.

Ross Adelson

I do not support the addition of lanes to 270 under a p3 system. I think the e state should be the sole owner and operator of roads in md. I also believe that there should be increased public transport and bus lanes on the highways

Program Updates Summer 2020

Greetings,

In an ongoing effort to keep you informed of the latest and most accurate information about the I-495 & I-270 Public-Private Partnership (P3) Program, I am pleased to share with you the [Summer 2020 Newsletter](#).

The I-495 & I-270 Managed Lanes Study has entered an important phase for public input. We encourage your involvement in this process by reviewing the [Draft Environmental Impact Study \(DEIS\)](#) and by participation in one of the [virtual or in-person public hearings](#). Further details are included in the attached newsletter.

We understand how COVID-19 is impacting all Marylanders today – in how we work, in how we spend our free time, and in how we travel. While MDOT's number one priority is the health and safety of Marylanders, we continue with our efforts to ensure transportation improvements are being developed to meet our State's needs not only for today but for the next 20-plus years. We will continue to work collaboratively with all our stakeholders in the development of the I-495 & I-270 P3 Program.

We will continue to keep you updated on P3 developments and welcome your feedback. Please visit 495-270-P3.com for the latest information.

Sincerely,

Lisa B. Choplin, DBIA

As a resident of Rockville, MD, I strongly oppose the widening of I-270 for many reasons:

1. The negative impact of this plan on people's homes will be substantial. I am greatly concerned that the increase of noise and air pollution closer to our homes will be very detrimental to the health and well-being of many families, including my own.
2. The negative impact on the Upper Watts Branch and the invasion and destruction of our beloved neighborhood Woodley Gardens Park. This peaceful ecosystem has provided our family a sense of belonging and integration with nature that is the main reason why we moved here.
3. The destruction of local businesses whose proximity to I-270 puts them in danger, specifically the shops in the Woodley Gardens neighborhood of Rockville.
4. Making life worse for years both from construction hardships and the increase in taxes to pay for this unnecessary decision.

I oppose this project and support the NO-BUILD option.

Instead, I support increasing public transportation options for commuters and others. Inclusive options include building more parks and green open spaces for the community, rapid buses, increase frequency of public transportation, and encourage more sustainable and healthier ways of transportation

Thank you for considering the negative impact of widening I-270 and finding other more sensible ways of handling transportation issues in Maryland.

Subject: Protect parks from the I-495 and I-270 expansions

Dear Director of the I-495 and I-270 P3 Office Lisa B. Choplin,

Please do not move forward with the proposed expansion of I-495 and I-270. I understand that expanding these highways would directly impact six National Parks, and indirectly impact a seventh, plus 41 local parks. This is ridiculous and unacceptable.

We do not have enough protected land. Our forests and wetlands are under threat as it is. Taking the protections we have seriously is the least we should do.

We need MORE protected land, not cutting supposedly protected forests down for some highway.

If you want to ease traffic congestion, support carpooling and mass transit.

Regards,
Caroline Ailanthus

John Alagash

I am troubled to see the hands of one controversial firm all over this preliminary study. When will the State of Maryland learn? This firm cooked the traffic numbers on the ICC project, screwed up the Red Line in Baltimore City and County and torpedoed the Purple Line in PGCo - MoCo . Might as well had the Grim Reaper prepare the documents.Sad by how our taxes are being wasted.

Husain Alaskari

I oppose this project and support the NO-BUILD option. pump the \$11 Billion into public transportation, bike lanes, renewable energy, and public free healthcare. instead of wasting the money on an unnecessary project that will create an increase in pollution-producing traffic.

Elliott Alderman

I strongly oppose the expansion of 495 and support a no build option. There is already too much traffic in the area, particularly on Georgia Avenue near Forest Glen -- which is among the most dangerous intersections in Montgomery County.

In addition, I am deeply concerned about the environmental impact to Sligo Creek and Rock Creek parks. There are already flooding and other issues without the assault and destruction of widening already overburdened roads.

Subject: Extend the I-495 and I-270 comment period to at least 120 days

Dear Lisa Choplin,

In the age of climate change, how can our state and regional leaders unconscionably truncate an environmental review process in the interest of forwarding a project that will dump additional CO2 into our air and speed up the rate of climate change? We need a full comment period to review this project in contrast to fair and equitable solutions that will affordably move all people around our region without adding to the planet wide problem of climate change. That means we need good public transit planning now more than ever. Our leaders can do better than the antiquated and unimaginative answer of dumping more cars onto the road. With a 120 day comment period, the public can adequately address the real danger to our regional access to green space - access that is more important than ever now during the pandemic. How can decision makers think that destroying parkland is a good idea and not listen to the public that desires future-facing decisions, not concrete highways and more cars!

Please extend the comment period on the draft Environmental Impact Statement (DEIS) on the I-495 and I-270 plan for 90 to at least 120 days.?

I am a resident currently very concerned about the impact that this over \$11 billion project will have on our water, land, air quality, and pocketbooks in the midst of a global pandemic and economic downturn.?

The comment period is only 90 days for this massive 18,000 page, 90-pound document. The 90 day comment period would not be enough time for a person reading 40 hours a week to get through all the pages of the document. It is unreasonable to expect me or any other member of the public to comment on a plan that requires us to access large documents online or in public during a global pandemic in this amount of time.?

Please extend the comment period to at least 120 days so I can meaningfully participate in a project that could have and impact on me and my family for generations.?

Sincerely,

Lisa Alexander

I commented on this before, but I would like to reassert, more than a year later, that I find this proposal ridiculous and just a way for the state of Maryland to profit off a public resource that our county practically requires for daily commutes. It's like a classist avenue saying "oh, only those with money to spare for a toll shall avoid traffic" ...how is that fair? And I speak as someone with an EZpass...

Subject: Halt I-495/I-270 expansion: Bad for communities, bad for climate

Dear MDOT officials, Comptroller Franchot and State Treasurer Kopp,

As a resident of Montgomery County who lives near the Beltway and as a citizen concerned about the increasingly irreversible impacts of climate change, **I respectfully request that you halt plans to expand the Beltway and seek alternatives that do not lock Maryland into expensive and polluting highway infrastructure.**

Expanding the Beltway with luxury lanes when we're already on a disastrous trajectory to unconstrained global warming, especially at a time of great traffic pattern uncertainty during the pandemic, is nothing short of irresponsible. Though zero-emissions vehicles are on the rise, we should not be encouraging inefficient consumption through the subsidization of highways and the private cars that drive on them. Instead, we should be funding zero-emissions public transportation options that redirect congestion away from the Beltway entirely. The draft EIS you produced does not address climate change in any way and countless studies demonstrate that adding lanes to a highway only results in additional congestion over time.

Thank you for hearing my concerns and halting I-495/I-270 expansion, which clearly warrants much deeper analysis.

Sincerely,
Kelsey Allagood

Subject: In support of No build option with respect to proposed 495/270 expansion

I oppose the 495/270 expansion. I support the no build option for a multitude of reasons.

- 1. Any short term traffic relief will be short-lived and the roads will fill up again through induced demand*
- 2. Damage to local parklands that can not be mitigated such as the playgrounds near the Indian Spring YMCA*
- 3. Too close to large schools such as Montgomery Blair HS with taking of school grounds for a for-profit companies benefit*
- 4. Cost of moving utilities will not be paid by the for profit company or the road users but by consumers who may or may not use the tollroad--this is inequitable and wrong*
- 5. We need a visionary viewpoint on transportation to move people not cars. The toll road is a 20th century viewpoint*
- 6. Changed work patterns owing to the COVID-19 crisis show that there is an alternative to building more roads so workers must commute to the city--the expansion of telework.*
- 7. Potential loss of my and my neighbors property*
- 8 Water runoff into the local neighborhoods will undo local storm water control measures and result in additional costs to local residents*
- 9 Evidence of the problems that can occur with a P3 when the contractor walks away from the Purple Line P3.*
- 10. Too long of a time period and trying to sell a "free road" to current residents. The decision makers will not be around to deal with the attempt to get a "free lunch" to build a new roadway. There are no free lunches. The consequences will fall on future taxpayers of Maryland.*

These are reasons why I support the no build option.

*Jan Allen
Silver Spring, 20901*

Nicholas Allen

As a life long silver spring and Takoma Park resident I can say that we as citizens do not want the beltway any larger than it is. The county needs to look into alternative plans, or whether in the age of COVID there is even a needs for expansion. Also, privately run hot lanes is a terrible idea and does not benefit our county in the long run.

I am opposed to expanding the beltway.

lauri alsaffar

No need for additional highway lanes on 270/495 More consideration is needed for public transportation, such as light rail, heavy rail (including rail alignment on the Cabin John Bridge, such as the Woodrow Wilson Bridge has(the cable stay technique), monorail, and/or bus rapid transit. (Hogan--who will be voted out of office in 2022 didn't even LOOK at these proposals,) There IS climate change and the environmental costs are unacceptable. The Virginia Transurban deal is NOT a success and promises have not been kept. It would also cause discrimination against the people who cannot afford to use the lanes for which they had to pay (tolls in virginia that Transurban promised would not be more than \$4 are now more than \$20) People will avoid the tolls and go through neighborhoods, as they are doing in Virginia. That deal was done in secret. Transurban pays no taxes and the bond termination is now 2087 Also, trucks need to be rerouted onto dedicated lanes. They will soon be driverless and imagine a truck like that behind your FAMILY CAR Also, the pandemic has changed everything, there is much less traffic and more need to put people and trees ahead of oil and gas and asphalt Thankyou for the opportunity to share my views, as a taxpayer and a Maryland resident for most of my 76 years>

Peter Altman

To whom it may concern:

I oppose the I-495 and I-270 project. I support the no-build option.

The planning process leading to the I-270 and I-495 expansion and the current proposal:

- fail to account for the well-documented fact that widening highways doesn't work to reduce congestion because widened roads attract more cars - something we clearly saw with I-270 last time it was widened. In fact, the draft environmental impact statement (DEIS) shows that traffic congestion on I-270 north will be worse after lanes are added (DEIS Appendix C, page 124.)
- fail to adequately examine alternatives such as transit options, traffic management or the ICC (MD Route 200) alternative proposed by Montgomery County.
- fail to consider how a greater reliance on working from home could curb traffic. Especially given that the pandemic has already shown us that many jobs can be performed from home, this option should get more attention.
- Will cost taxpayers a lot of money. The project, which was originally marketed as costing taxpayers nothing, will in fact cost taxpayers \$1 billion and WSSC customers as much as \$2 billion.
- Poses significant threats to our climate, air and water. For example,
 - It would harm 45 public parks and open spaces, including Greenbelt Park, Sligo Creek Park, Rock Creek Park, Woottons Mill Park, Cabin John Regional Park and Cherry Hill Road Park.
 - It will increase air pollution including increased particulate matter, carbon monoxide, ozone, nitrous dioxide and global warming emissions.
 - It will increase dirty stormwater runoff that will harm our creeks, streams and rivers.
 - It will increase stormwater runoff, which could increase flooding risks for communities near the highways.
 - Over 50 acres of wetlands could be negatively impacted.

Overall, this is an ill-considered, counter-productive proposal that will worsen rather than improve our quality of life here in Montgomery County, and do little over the long-term to sustainably address traffic congestion.

Sincerely,

Peter Altman

Subject: No Beltway I-495/I-270 Expansion

Lisa Choplin,

As a Gaithersburg resident who is extremely concerned about the climate crisis, I strongly oppose the proposed Beltway I-495/I-270 expansion. Adding more cars on the road will not solve traffic congestion. Instead, the resulting increase in air pollution and carbon emissions will exacerbate climate change and public health crises that currently threaten our region, our country, and our planet. We need solutions such as expanded and more accessible public transportation and increased teleworking that decrease sprawl and reduce greenhouse gas emissions and water pollution.

The expansion would also propose a significant financial risk to residents of the region. The Washington Suburban Sanitary Commission (WSSC) has predicted that it would cost \$2 billion to move all the sewer systems in Montgomery and Prince George's Counties in order to accommodate the highway expansion.

Please do not move forward with the proposed highway expansion. Instead, we must invest in a swift and just transition to 100% renewable energy and replace polluting cars with clean public transit before it's too late to stop the climate crisis from claiming millions of lives.

Madeline Amalphy

When it comes to Beltway expansion, the upsides are few or illusory; the downsides are many. A wider Beltway would rip up residential neighborhoods, shrink the already meager housing stock in our area, reduce green space in Rock Creek Park and Sligo Creek Park, spew more CO2 and particulate pollution into our air, and increase the already thunderous noise. It would be bad for our community, for public health, and for general quality of life. Our local wildlife, too, would be adversely affected, as a larger Beltway would further disrupt and fragment already challenged natural habitats.

I live about 1.5 mi. away, but can still hear the Beltway traffic at night.

Expanding highways generally does not relieve traffic but multiplies it. Let's spend our state dollars on better things.

I oppose all Build Alternatives.

Thank you for the opportunity to comment.

Anne Ambler
[REDACTED] Kuhl Road
Silver Spring, MD 20902

**Comments on the Maryland DOT Managed Lanes Study
Draft Environmental Impact Statement
November 9, 2020**

My name is Anne Ambler. I have lived at [REDACTED] Kuhl Road, Silver Spring, MD 20902 since 1970, but grew up on the edge of Rock Creek Park.

I oppose all of the “Build” alternatives. I support the “No-Build” option.

I was here when the beltway rerouted Beach Drive, put streams into culverts, and cut a loud, polluting swath through Rock Creek Park, and when I-270 was initially built and expanded numerous times. The beltway also cut communities along its path in Montgomery and Prince George’s counties and created a barrier for alternate means of transportation—walking and biking.¹ The beltway and I-270 belong to the era when the car ruled supreme and people gave little thought to air or water pollution and none at all to the potential for destroying the natural systems we depend on, including a livable climate.

Then when we should have known better, the Intercounty Connector (ICC) paved over the wooded links that had enabled wildlife to go from one stream valley park to another, although at least the stream valleys got bridges rather than culverts. Extraordinary measures were taken to preserve the quality of Paint Branch—pumping ICC road and parking lot runoff over to the Northwest Branch. But Paint Branch died anyway, having lost its base flow. How many people remember that all this damage was sold to the public as necessary to relieve congestion on the beltway? So...why is it now a question of expanding the beltway?

The good news is that people are finally coming to realize that new solutions to mobility must be found, or the neighborhoods and the planet we leave to our children will be at first very unpleasant, and then unlivable. Times have changed. COVID-19 has shown that physical movement is not even always necessary.

Regarding the current Draft Environmental Impact Statement (DEIS), it has become increasingly clear that the true monetary and environmental costs of this project are unknown, although likely more than stated, while the benefits are few and limited to the wealthy. A deep dive into the DEIS traffic analysis by traffic modeling experts shows that the plan creates more congestion delay for most people, not just on the highways in the project, but on the roads feeding the highways, while the alleged traffic benefits apply to only those few who can afford tolls of nearly \$50 for a one-way trip.

The costs of the project for the rest of us include loss of valued parkland, increased polluted runoff into our streams, and increased air pollution. These constitute a huge step backward to

¹ See the recent blog post, <https://ggwash.org/view/79513/bike-and-ped-connectivity-is-threatened-by-highway-expansion-how-to-weigh-in>

our efforts to reduce greenhouse gases causing climate change as well as our efforts to comply with MS4 clean water requirements. Along with those costs will be our increased WSSC costs to cover half (or more) of the \$2 billion relocation of major water mains in the I-270 corridor.

Legal Requirements are not met. The lawyers will provide chapter and verse for requirements of the National Environmental Policy Act (NEPA), Transportation Act Section 4(f), and the Historic Preservation Act. I will just summarize that NEPA Environmental Impact Statements must start with a Purpose and Need (P&N) Statement honest enough to include multiple options *with different expected effects*. But the present DEIS P&N statement simply defined out transit because it would not pay for itself—which the toll roads would not either, as the DEIS reveals. Transportation Demand Management was dismissed because it didn't add "capacity," that is, additional lanes. Unsurprisingly, after dismissing everything other than adding toll lanes, all the alternatives chosen for further study have virtually the same environmental impact, undercutting part of the purpose of an environmental impact study.

NEPA requires the DEIS to describe the expected damage from the project and possible mitigation in enough detail that environmental consequences can be realistically evaluated.

The damage to our parks and streams, even as described, is considerable—but it would surely be much more than what is described. Consider, for example, the effect of gouging switchbacks 50 feet wide nearly 140 feet down almost vertical slopes on both sides of the Northwest Branch to enable cranes to descend to stream level, break up and lower the bridge span pieces onto trucks and carry them back up. The plan also includes service roads cut through the park on both sides of the valley to connect with the existing roadway and a temporary bridge 140 feet up, 45 feet wide and 105 feet long with deep footings constructed over the valley. All of this is before construction can even begin on the new much wider spans. Mitigation consists of switchbacks on only the south side, so the limit of disturbance extends out from the ROW only on that side.

Although the report fails to describe the impact, as it is supposed to do, we can easily imagine the resulting muddy surges of runoff, especially with increasingly heavy rains from our changing climate. And post construction, the Northwest Branch would be dealing with runoff from an additional 4 lanes of roadway.

The Northwest Branch is but one of our several streams, all of which are subject to Clean Water Act standards as yet far from attained. The existing beltway had no stormwater controls, yet the proposal is to provide stormwater management for just 50% of the few lanes dug out to underlying dirt, and then add more than 550 acres of new impervious surface. Adding insult to injury, the damage to streams in places where MDOT already has either ownership or an easement (e.g., the Northwest Branch) and the distance under the existing hundreds of culverts *are deducted from the calculation of stream feet needing to be offset. Yet the streams have been suffering from confinement in those culverts since the initial construction of the beltway!*

The DEIS acknowledges that overall, the project would negatively affect 120 acres of 100-year flood plain, 50 acres of wetlands, nearly 30 miles of streams, and 1500 acres of forest canopy—essential to protect streams. It affects dozens of local parks and 86 acres of national parks. Proposed mitigation involves projects elsewhere in the state and water trading credits! Where will this leave our ability to meet our MS4 requirements?

As for air quality, the DEIS admits that the project would increase carbon monoxide, ozone, nitrous dioxide, particulates, and greenhouse gases—without addressing mitigation.

Conclusion:

The 19,000 pages of the Draft Environmental Impact Statement (DEIS) fail to provide the information necessary to evaluate such a huge undertaking, while offering abundant evidence that the project should not proceed.

It boils down to this: What kind of a community and world do we want for ourselves and our descendants? One where we walk beside blown-out muddy streams devoid of fish, and breathe toxic air? Or one where we use the knowledge gained from years of mistakes to create a healthy, green community? We know the importance of tree canopy to water quality. We know what happens to streams from runoff from hot, polluted pavement. We know that air pollution damages young brains, lowering IQ and causing asthma. Are we willing to just write off communities near these highways? We know the importance of green space overall to human health. And we know that continuing to pour greenhouse gases into the air will result in a climate where humans cannot thrive or ultimately even survive.

I urge you to reject this DEIS and this project. Convene a regional meeting. Determine what is really needed, and if it involves building something, plan to pay for it directly. We have ample experience now with P3s—the Purple Line fiasco and others around the country-- to know they are not in the best interest of Marylanders.

Our children and grandchildren will live with the choices we make. Let us make responsible ones that enhance their future and promote a vibrant, green, healthy, sustainable Maryland.

Thank you for the opportunity to comment.

Anne Ambler

Silver Spring, MD 20902
[REDACTED]

Anne Ament

Why are we spending money on this? We know cars pollute the air. We know the damage stormwater from impervious surfaces causes our streams, rivers, bays, and oceans. Why should we continue on this "road"? We need to invest in clean energy and clean mass transit now. Stop the damage now.

Name: Ramin Amin

Joint Public Hearing Date: 9/3/2020

Type/Session: Live Testimony/Afternoon

Transcription:

Can you hear me? Oh Ok. My name is Ramin Amin. I live on [REDACTED] Broad Brook Drive Bethesda, Maryland 20816.

R-A-M-I-N, the last name is A-M-I-N. I live on [REDACTED] Broad Brook Drive, Bethesda Maryland 20816. Today, I'm testifying against and oppose to the 495 270 expansion project, which to date has reached \$11 billion dollars of taxpayers money and will continue to rise due to many factors that have not been considered today. As an engineer for many years of experience in civil and construction, I can assure you that this project will not achieve the goals due to the fact that expanding the highway will not remedy the traffic issues that we have currently have. But promote more vehicles and the cycle will continue in a few years from now. This is only a bandage. In addition, the survey that was taken for the current traffic was prior to the great pandemic that we have. Today many companies, including Federal Government, has successfully tested the telework and continue on this path, regardless of future cures for the COVID-19. This new great strategy has reduced the traffic as I have personally experienced it myself. Last, I encourage instead of spending billions of taxpayer's money on highway expansions for the government to promote additional tax benefits to corporations for exercising the telework program and our aging transit system, such as monorail or current metro systems. The corporations can also benefit the tax incentives to provide not only telework, but flexible work hours and compressed hours. I'm sure if we exercised the options, we can reduce the traffic without much cost to the taxpayer. As a result, I'm totally against a plan that has not studied properly the current conditions that we are living with and the nice package of different options that they provided is just an icing, like an icing on the cake. It's all outdated. It's from 1970s and it doesn't factor any future that we are progressing into the future for other means. As a result, I'm not in favor of this program.

I am vehemently opposed to any expansion of I-495 and I-270 because the air here is already impossible to breathe - we need to invest in clean pollution free transportation!

[Sent from Yahoo Mail on Android](#)

Andrey Andreev

I oppose this project and support NO-BUILD option.

My family wake up sometimes because of motorcycle and trucks noise in the middle of the night. I think there must be a wall built. New lanes does not make sense. I live in this area for 15 years and I think roads are wide enough. During covid-19 outbreak I did not noticed any traffic issues, so obviously all traffic generated by office workers driving each day to work. Invest into public transportation instead of building new lanes.

I wish I could travel to Reston/Tyson Corner by bus or metro in 30 minutes, instead of driving 45 minutes in traffic or spend 2 hours in metro.

Virginia increased number of lanes on the beltway, traffic become even worse.

Suggestions:

- 1) Don't ruin our lives and woods by this long term construction. This will not help solve traffic issues.
- 2) Invest into public transportation
- 3) Build bicycle trails. Many people can use electric scooters, boards and bikes to commute.
- 4) Build a wall along highway to protect us from the high frequencies/amplitude noise.

A lot of noise from the road. we need to build a wall. build more lanes - not possible, it will be to close to our homes.

namrata andriessens

No luxury lanes on 270 -495. Invest in public transport, light rail.bus. POST and thanks to COVID Nature has revived and a lot of us will be working from home so traffic patterns will change and we don't need major investment in roads and anticipated traffic problems anymore

Sarah Ankrapp

I oppose the I-495 and I-270 project. I support the no-build option.

I do not agree that toll lanes, especially resulting from P3 partnership, are the proper solution for our highways. They create not only a literal lane divide but an economic divide among travelers on these roadways. The state would be building lanes that few travelers would use and be able to afford.

The study clearly presents findings of great concern, including evidence that the P3 toll lane options would not solve our traffic issues and cause significant residual issues to many communities adjacent to the corridor.

Unfortunately, of the remaining options in the plan, the only one without such lanes is the no-build option.

Do Not
Build!

From: [REDACTED]
To: [Dinne, John J CIV USARMY CENAB \(USA\)](#)
Subject: [Non-DoD Source] I oppose the I-495 and I-270 project
Date: Thursday, November 05, 2020 4:37:15 PM

John Dinne,

I oppose the I-495 and I-270 project. I support the no-build option.

Here are my reasons.

1. Environmentally speaking, if we are to take seriously the Greenhouse Gas (GHG) Emissions Reduction Act Reauthorization of 2019 which stipulates a GHG reduction of 40% from the levels of 2006 by 2030, it does not make sense to continue in the rut of the past, adding ever more lanes to our highways. We cannot build our way out of congestion with more highway lanes, we need a transition to smarter transportation, like rapid transit buses, trolleys, high speed rail etc.. Unlike most developed countries, shamefully we do not even have a Metro line from the capital and the suburbs all the way to the international airport yet. Additionally, experience shows that building more lanes only encourages more people to move further out of the DMV area, thus setting off a new cycle of traffic congestion.
2. Luxury lanes with high cost for the users fly in the face of affordable transportation for an equitable community; only wealthy drivers can afford those luxury lanes in a pay to play arrangement. Experience also shows that P3 projects for toll lanes do not have a good financial track record and often do not achieve the expected profits, leaving the taxpayer to pick up the tab. This is a serious social justice issue.
3. As widely shown in similar public private partnerships (P3), they tend to dump costs on the taxpayer, in this case for example the cost for moving water and sewage pipelines (estimated at up to \$2 billion) which are not even part of the estimated project cost. But there is also the risk of a lot of other unforeseen downstream costs, such as litigation costs, delays, overestimation of the expected usage resulting in less than the projected profits etc.. It already seems clear that the state will have to subsidize the project in one way or another. That means privatizing profits and socializing the costs.
4. One of the reasons why my partner and I chose to live in this area is that we love the surrounding public parks and use them very frequently, almost daily. We have already observed considerable loss of parkland and of trees due to new housing construction and wide-spread erosion around the creeks. These beautiful parks in Montgomery County were supposed to be protected natural spaces but now 45 of them seem to be on the chopping block. They provide an important function for CO2 absorption but also healthy recreation and education for children. Destroying these protected areas only to face clogged highways again in a few years like in California would be irresponsible.
5. The inevitable major disruption of traffic and resulting traffic chaos around the construction sites to be expected for the next years, as well as the air and groundwater pollution and increased traffic make this ill-conceived project unacceptable for concerned citizens.

We need a true 21st century long-term vision for our transportation challenges, not shortsighted fixes.

Eliot Applestein

I oppose the I-495 and I-270 project. I support the no-build option. The current plan to build is short-sighted. A Wall Street Journal article: "Working From Home?" published Oct. 26, 2020, noted that "A recent survey of more than 4,000 people working full time remotely during the pandemic found that 65% would like to make the arrangement permanent...." If remote work, even of one or two days a week becomes the new normal, traffic on 495 and 270 will go down substantially. Moreover, the current plan appears to affect a number of low income residents who may lose their homes. This is a common scenario played out in many jurisdictions and has been referred to as environmental racism. It's time to keep hands off this group of citizens. Lastly, if the tolls do not generate the revenue "promised" the private builders, we, the public will be responsible for paying these private entities. For these reasons, I do not support the build plan.

Subject: Opposition to the I-270 Widening Project

To whom it may concern:

I oppose the I-495 and I-270 project and support the no-build option.

The main reason is that I believe that the widening plan will simply not work. I based this on my observations of the I-495 Capital Beltway traffic in Virginia. Despite the presence of toll lanes, traffic backs up frequently.

My office is in Tysons Corner off of VA 7 and as I enter the Beltway towards Maryland, I see the traffic going towards Springfield/I-95 as I go over the Beltway overpass which is backed up as far as I can see.

This backup occurs by early to mid-afternoon. So, despite a tremendous effort on the part of Virginia's government, traffic on the Beltway in Virginia remains heavy. Toll lanes have not solved the problem.

I-270 in Rockville is already 6 lanes in each direction. If more lane capacity is needed, simply removing the Jersey barriers and reconfiguring the road would do it. It is not necessary to undertake a massive construction project that will ultimately fail.

Please contact me with any questions.

Subject: Don't Widen 270

Dear MDOT,

I oppose the I-495 and I-270 project to widen the roads. I support the no-build options.

I oppose the widening of I270. I do not feel the addition of more lanes is going to ease congestion on this road because the majority of the traffic is going past where the widening will occur and will just cause the backup to occur lower down on I-270.

This project would cause destruction of and great harm to many homes, businesses and the environment along its path. The noise, dust, poor air quality and effect on trees and streams would be horrendous.

It would also cause a burden on taxpayers for the road and water improvements that would need to be made for this project. Many of the bridges over I-270 would need to be removed and made bigger which would ultimately be funded in part by taxpayer money. The cost for WSSC to make its improvements would be reflected in our water bills.

The worst part is it would all be for nothing because it will not fix the congestion problem. I support reversible lanes and commuter bus lanes within the current footprint of the road. It works in DC to have reversible lanes.

Please do not do this to the area we love.

Sincerely yours,
Diane Arcieri

Subject: opposed to 495 expansion

Dear MDOT,

Our household strongly opposes any and all expansion plans for 495. The P3 projects of a similar nature all across the country have been failures. They not only charge exorbitant amounts for the toll lanes, the net game is they end up increasing congestion. As well as leaving the state municipalities on the hook for costs. This also is in stark contrast to the Governors promise of the project not costing the taxpayers a dime. The state's transparency on this project has been dubious from day one and has only gotten worse. The money could be better spent on public transportation and alleviating the need to drive, like the purple line. In every instance of a road expansion you simply invite more people to drive and fill up the increased capacity and not alleviating congestion and pollution.

We do not need a many yeared project that will cost BILLIONS that will in the end be a major regret and we'll be worse off than before.

Thank you for your time,

Scott Aronson

I-495 and I-270 Managed Lanes Study

Name: Diana Artemis

Joint Public Hearing Date: 8/25/2020

Type/Session: Voicemail

Transcription:

Hello, my name is Diana Artemis. I've lived in the DMV area since 1985 and I want the no-build option. This, this is throwing more money away at roads when we need more public transportation options. We, I don't want to continue to damage our environment and our communities and raise taxes to pay for all of this and I definitely want you to not widen 270. We need reversible lanes not high-priced tolls. We need expanded transit and you need to fix the upper 270 bottlenecks first. Please don't continue to destroy the environment, make us pay more tolls, and harm the air quality of our region. And I ask you to select the no-build option. Thank you.

Joseph Artrip

1. A third general purpose lane in each direction from Clarksburg to Frederick should be built before any toll lanes are built on 270.
2. The local lanes of 270 should be maintained as part of any plan to build toll lanes on 270. The local lanes greatly reduce congestion by minimizing weaving and merging. Removal of these lanes will result in congestion levels as seen on the Beltway.

Paul Arveson

I oppose the I-495 & I-270 toll lane project and support a no-build option. I live a mile from I-270 and the air and noise pollution are already serious problems. This is the time to shift out of traditional thinking and toward better, more imaginative solutions to commuter traffic. These include reversible lanes, light rail, electric buses, and work from home. These options deserve more consideration and will save taxpayer money.

Richard Ashford

As Benjamin Franklin said about the Constitution, it seems a perfectly good plan, if you can keep it. I think it is fine, but on the other hand, look at the Purple Line dispute over unforeseen costs which the government will not secure. How can one expect better with a far more complex endeavor? Build the bridge over the Potomac, and finish the outer Beltway (a far simpler endeavor, once you take on rich NIMBYS).

Stephen Ashurst

I support the no-build option. There should be no new lanes added to any portion of I 270 or I 495. Current space can be adjusted to allow bus transportation only. A better option would be allowing rail to run down the center of I 270 from Frederick. Again, no new lanes.

Giorgia Atchison

I live right next to I-495. I love my neighborhood and my community. Please don't devastate it by widening the highway. Noise pollution and air pollution are already at high levels as it is. Please don't make our lives miserable. Also, a project like this will have a negative impact for all tax payers in Maryland and for the environment, of course. Please look for alternative options that won't contribute to more destruction and to global warming. It's time to be part of the solution and not the problem.

Thanks

Giorgia Atchison

Michael Atlas

I'm all for widening these roads but I want no part of a toll hellscape as exists in Virginia. Widen the roads and don't charge tolls We pay enough taxes already in Maryland.

Falah Atrakchi

We strongly oppose this luxury lanes project and we hope this state will reconsider and find a better long term solution that goes well with the future in light of COVID-19 and the option of teleworking. Our family lived in the Rockshire neighborhood for 15 years and we like it to stay the way it is and no get destroyed by this illogical project

Charles Atwell

I oppose the project. My house and neighborhood would be adversely affected.
I support The no-build option. More bikeways/walkways and transit should be built.

To: MLS-NEPA-P3; aklase@marylandtaxes.gov
Subject: Beltway widening

Hello, I would like to record a comment regarding the Beltway/270 widening project.

I strongly support the expansion of the American Legion bridge. That portion of the project should be advanced as soon as possible. The bridge should include a bike/ped connection to trails on both sides of the river.

I think the HOT lanes should be constructed from the bridge to the 270/495 split. However I am not convinced that there is space to expand the beltway further east without undue influence on park land and homes near the roadway, especially in the Bethesda area. Instead, the focus should be on improving rail and bus service along the 270 corridor and express bus service with a dedicated lane (or shoulder use) on 495.

Also a full interchange for the Greenbelt metro station should be built, even if the HOT lanes are not constructed through that area. They should be designed along with a new parking garage and mixed use development for the current parking lot.

thanks,

John Ausema

John Ausema
Greenbelt, MD

Robert Ausura

I have lived in Gaithersburg since 1972 and watched the steady expansion of I270 and I495. Each expansion relieves the horrid traffic for several months until increased traffic flow necessitates a new expansion plan and several more years of debate and construction. Every "improvement" simply invites more vehicles. We are chasing our tail when it comes to automotive transportation, and we've got to stop. Each expansion not only claims more private and public land, consumes more resources, and costs more taxpayer dollars but also encourages behavior that directly opposes efforts against climate change.

Rather than pursuing a road project that is "more of the same" and no one expects to provide a longterm solution, why not be bold and visionary and pioneer a public transportation strategy--light rail, increased bus service--that has at least a chance of reducing automotive inflation? Yes, there will be public resistance. People want their individual conveniences. But if the current COVID-19 situation has taught us, [most] people will adapt to new ways if they see the benefit.

Tom Autrey

I do not think you should advance any of the build alternatives until you have provided a detailed explanation of the assumptions, methodology, and results of a new travel forecast analysis using post COVID travel patterns as a baseline.

The file attached is a study just completed by the University of Maryland's National Center for Smart Growth which addresses the Managed Lane Study in the context of a broader analysis of future scenarios for the Baltimore-Washington Region, which explicitly include the managed lanes.

PRESTO

PROSPECTS FOR REGIONAL SUSTAINABILITY TOMORROW

Can our region maintain its dynamic economy and quality of life if the future promises inexorable traffic gridlock? We tackle the congestion part of this question by creating scenarios of possible futures that address congestion in various ways. The prospect of autonomous vehicles sharply differentiates these scenarios. We assess policies that do very little, add new tolled roads, or assume smarter growth patterns. We analyze their impacts on population location, travel patterns, transit ridership, and greenhouse gases. We develop policy recommendations, some of which differ from ones currently being considered.

Smarter Roads, Smarter Cars, Smarter Growth?

September 2020

This report is dedicated with much honor and respect for the memory of Andrew McMillan who led and conducted much of the critical technical work for this report with commitment and care. We couldn't have completed this work without him.

Letter from our Executive Director

The National Center for Smart Growth Research and Education is pleased to contribute this report to the ongoing dialog on the proposal to add toll lanes to Interstates 495 and 270. Of course, we are not the first organization to analyze this question. Our intent is not to challenge the analyses of other organizations, but to offer a new approach and to raise new issues of timing and technology that have not yet undergone critical analysis.

Toward this end, we employ a well-tested set of computer models, used by us and others, to examine how alternative transportation scenarios address traffic flows, traffic congestion, transit ridership, development patterns, greenhouse gas emissions, and more. What makes our analysis unique is the simultaneous examination of those issues in loosely coupled models that permit feedback between the models, including how transportation expansions indirectly affect population redistribution. Also unique is our consideration of autonomous vehicles to explore how this disruptive technology might influence the choice of alternative strategies. While our analysis is far from comprehensive and the insights we uncover are not definitive, we believe they are worthy of serious consideration.

First, we suggest that the adoption of autonomous vehicles has the potential to alter the relative efficacy of alternative transportation strategies well within the planning horizon. More specifically, we suggest that the case for new tolled freeway lanes is less compelling if autonomous vehicles alone provide significant increases in freeway capacity.

Second, with or without autonomous vehicles, we find the case for new lanes on I-495 to be stronger than the case for new lanes on I-270. This suggests it might be wise to consider these lane expansions as two distinct decisions, and perhaps decide on I-495 before deciding to expand I-270.

Finally, we find that smart growth strategies that provide for more development or redevelopment in core cities and inner suburbs plus selective transit expansion can provide some congestion relief, with smaller increases in vehicular travel and greenhouse gas emissions, if autonomous vehicles are rapidly adopted.

Like most of the work at the NCSG, this report represents the collaboration of many faculty, students and staff but does not reflect the views or perspectives of the University of Maryland or the four schools with which the NCSG is affiliated. We also acknowledge the Town Creek Foundation, which has generously supported our work in this area for nearly a decade. We alone, however, bear responsibility for the contents of this report.

Sincerely,

Gerrit Knaap
National Center for Smart Growth

Introduction

Growth in the Baltimore-Washington region continues to fuel debate about the best ways to address the resulting traffic congestion. This congestion, among the worst in the nation, is seen as an individual burden in wasted time and productivity as well as a barrier to regional economic development. Multibillion-dollar proposals to overhaul and expand the region’s Metro system vie with even larger plans to add tolled lanes to major expressways, as proposed in the Maryland Traffic Relief Plan (TRP).¹

Debates swirl around the impacts of these initiatives on transit, air quality, and land use. On the last point, county land use plans, over the past decades, have taken a smart growth approach and advocate for denser development around transit nodes in the name of congestion reduction and improved job access for all. Looming in the background is speculation about the impacts of autonomous vehicles (AVs) on congestion, travel behavior, transit viability, and land use. Furthermore, congestion solutions are increasingly viewed through the wide-angle lens of sustainability, with its emphasis on reduced energy consumption, resource conservation, and access to opportunity.

To explore the interplay of these uncertainties and forces, we present here an exploratory scenario approach, with the intent to identify both robust strategies, or policies that could work with all of these futures, and contingent strategies, that would help only under certain conditions.

We’ve created five scenarios for the year 2040 depicted as the various combinations in Figure 1. They are the result of combining two possibilities over which the State has little influence—the penetration of autonomous vehicles, at zero or at 25 percent—and three policy options: implementing existing plans, adding tolled freeway lanes, and adopting an even smarter growth land use and transit strategy. The maintenance of existing plans trends yields a 2040 baseline case against which the impacts of the other scenarios are measured.

Even though our focus is the greater Baltimore-Washington region, the potential impacts of transportation and other policy changes will reach beyond this region.

Figure 1. The Baseline and the Five Scenarios

Policy Options	External Factors	
	No AVs	25% AVs
Trends	Baseline	x
Additional Tolled Lanes	x	x
Smarter Growth	x	x

Modeling a larger study area captures these effects and allows for a broad consideration of impacts. The study area thus extends into the neighboring states of Virginia, West Virginia, southern Pennsylvania, Delaware and into D.C. By 2040 this study area will have a population of 15.6 million, with the Baltimore-Washington region at about 10.6 million residents.

We use various models to analyze selected impacts of the scenarios, as measured by primarily six indicators:

- Population growth shifts
- Traffic (measured as Vehicle Miles Traveled or VMT)
- Travel time (measured as Vehicle Hours Traveled or VHT)
- Delay (measured as Vehicle Hours of Delay or VHD)
- Transit ridership
- Vehicular emissions (greenhouse gases or GHG in tons per day)

After describing the models and indicators, we present the baseline conditions for the region’s population, job distribution, and transportation conditions in 2015 and as projected to 2040, absent any significant policy and infrastructure interventions. We then test the five scenarios, organized by different geographies, and highlight key findings. We conclude with policy recommendations.

The report presents scenario results in percentage differences from the baseline, color coded for clarity, while the Appendix presents numerical results and a more detailed narrative of traffic impacts. Full tabular model results are online at <https://www.umdsmartgrowth.org/projects/presto/>. There, we present results in absolute numbers and as percentages, with and without AVs, and adding four lanes, both with and without tolls to see their land use and other impacts. On the website, we also present these impacts (called MSTM only) without assuming any indirect population or land use changes that might result from the proposed toll facilities, which is the way such analysis is conventionally done. We also include the full tables for transit and GHG Impacts.

1. <https://www.roads.maryland.gov/mdotsha/pages/pressreleasedetails.aspx?newsId=2979&PageId=818>

Models, Assumptions, and Indicators

We divide the region into four subareas (Figure 2) with impacts reported for the region as a whole and for each subarea. The four subareas are the core cities of Baltimore and Washington, DC, (where the core includes both Arlington County and Alexandria City); the six inner counties around the cores; the eleven outer counties; and the remainder of the study area beyond the Baltimore-Washington region. We also report impacts for the proposed I-495 and I-270 toll and untolled facilities. We believe that their impacts, however, should be viewed within a larger, regional context to create a balanced picture of where and how changes are felt.

Modeling the future, or alternative futures, is a challenging enterprise. As is often said: all models are wrong; some models are useful. This section describes our models, some key assumptions, and our indicators. These indicators are not comprehensive and omit analyses needed for a proper understanding of sustainability, such as environmental, economic, fiscal or social impacts. Our analysis we believe, however, adds new and useful information. While much of it is relevant to the TRP's four proposed additional toll lanes on I-495 and I-270 (Figure 3) our models also incorporate the effects of autonomous vehicles on the region's freeways, as well as the effects of extending current smart growth plans and transit networks.

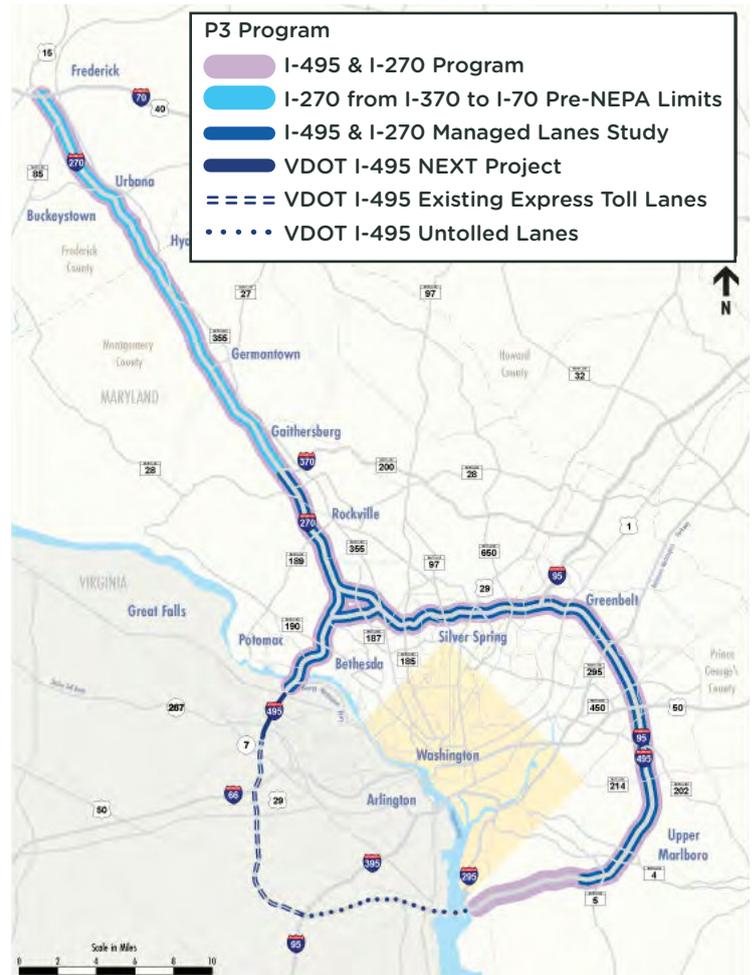

The Models

Our models include the Maryland Statewide Transportation Model (MSTM), a Mobile Emissions Model (MEM), and a land use model called the Simple Land Use Orchestrator (SILO) all of which cover the study area (Figure 2). These models interact so that shifts in population locations influence travel behavior and, likewise, changes in transportation networks or

policies influence land use by changing accessibility.

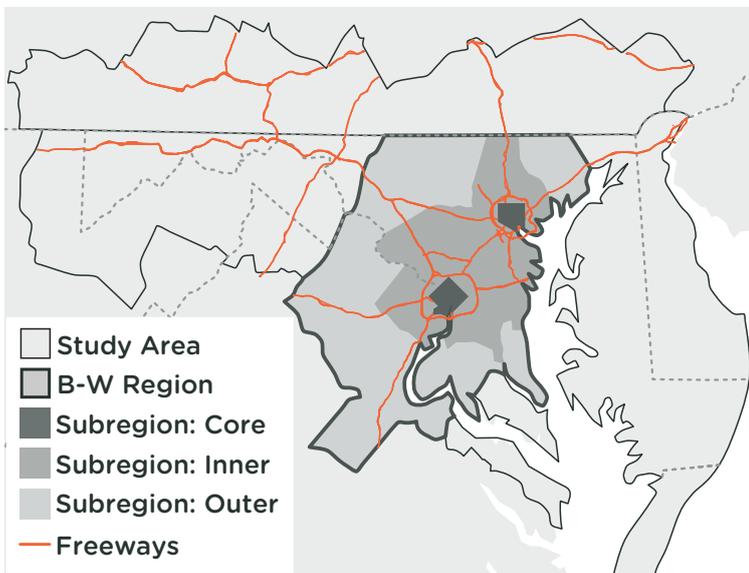

This two-way interaction is a key aspect of this study since most analyses of new highway capacity ignore its potential effects on population redistribution and thus land use. This produces results for delay and congestion, for example, that vary significantly from the standard modeling approach that considers only transportation impacts, as a comparison of outcomes on the relevant website tables attests. Capturing these effects is an important strength of our analysis.

Figure 2. The Region and Subareas

MSTM This statewide four-step travel demand model was developed for the Maryland State Highway Administration (SHA) for the entire study area. It was built by Parsons Brinkerhoff (now WSP) and the University of Maryland's National Center for Smart Growth (NCSG) between 2010-2013 and has been used in several studies by NCSG, SHA, and MDOT. The road and transit networks used in this report's 2040 baseline include all existing and committed projects (such as the pending circumferential Purple Line connecting Montgomery and Prince George's Counties inside the Beltway). Our model does not add detail such as interchange reconfiguration or ramp metering. It is a broad brush tool suitable for the level of analysis applied in this study

MEM The Mobile Emissions Model is a customized tool where the emission rates are applied from the US EPA's Motor Vehicle Emissions Simulator (MOVES) to MSTM-generated traffic flows to model transportation emissions. In the baseline and in all the scenarios, we make the conservative assumption that by 2040 zero-emission vehicles (ZEVs)² will comprise 10 percent of the vehicle fleet.³

SILO This model, initially developed as a research project by Parsons Brinckerhoff, Inc. for Minneapolis/St. Paul, was later implemented for Maryland, and has now been applied in seven metropolitan areas across the globe.⁴ It micro-simulates individual decisions by developers and households within a region, based on housing costs, transportation costs (including accessibility measures), and household budget tradeoffs. The model allocates housing units and households throughout a study area. SILO is particularly useful because it models real constraints in household budgets and in travel time to work. Notably, our implementation of SILO also incorporates the behavioral effects of racial segregation tendencies, school quality, crime, and development constraints represented by zoning. (Technical detail on SILO is provided on the project website.)

In this study we influence, rather than mechanically direct, SILO's residential growth allocation. We do this by modifying land development capacity by assuming zoning changes, a tool under the control of local policy makers. Because of central Maryland's constrained supply of developable land,

land capacity is an important factor influencing growth allocation.⁵ For the smarter growth (SG) scenario, we allow more growth and density in the core and inner subareas. The model then allocates growth based on this changed capacity and households' decisions.

Assumptions Regarding Autonomous Vehicles

Despite the growing consensus that Autonomous Vehicles (AVs) will be adopted more slowly than earlier imagined,⁶ their inevitability is widely accepted, as is their impact as a disruptive technology. The extent of AV adoption and its impacts are topics of extensive research and debate. AVs are seen as having at least two impacts on travel. First, they increase capacity on freeways by enabling vehicles to operate closer together. Second, because AVs allow drivers to do other things while driving, (reading, working, meeting remotely, relaxing etc.), time spent in the vehicle is less onerous and drivers are more willing to tolerate longer travel times and delays; this lowers the implicit cost of driving. The delay or congestion (VHD or V/C ratios) indicators in our AV analysis should thus not be seen as having the same adverse impacts for time spent in AVs as time spent in conventional vehicles.

In reviewing relevant AV research and modeling, including our own, we make the following conservative but plausible assumptions for travel and land use modeling.

- By 2040, 25 percent of the passenger car fleet will be AVs.
- AVs will increase vehicle capacity on all freeways by 25 percent because they operate closer together in narrower lanes.
- No capacity changes occur on arterial or collector roads.
- The value of time driving will fall by 33 percent for AVs, reflecting a more efficient or pleasurable use of travel time.
- Auto operating cost per mile will fall by 25 percent, reflecting expected cost savings from AV operations, such as lower fuel costs.
- Parking costs will fall 50 percent since AVs can seek lower cost, remote parking or can return home
- The value of general accessibility as a factor in household location decisions will fall by 15 percent.
- The value of travel time to work as a factor in household location decisions will fall by 15 percent.

2. A vehicle that never emits exhaust gas from the onboard source of power.

Travel Modeling in an Era of Connected and Automated Transportation Systems: An Investigation in the Dallas-Fort Worth Area; Data-Supported Transportation Operations; University of Texas at Austin: Austin, TX, USA, 2017

Indicators

The indicators are defined below. The first four travel metrics are applied at the regional and subregional scale. We introduce and apply the congestion metric of volume-to-capacity ratios (V/C) in discussing impacts on the Interstates, where we also present data on traffic volumes and volume per lane. Given the finer scale and issues of the toll lanes, these are appropriate indicators at the facility rather than at the subregional scale. All travel metrics are for the PM peak, the heaviest travel period of the day.

Impact Indicators and their Definitions:

Population growth shifts

The number of people who move into or leave the study area and its subareas in response to changes in land use capacity and accessibility.

Traffic: Vehicle Miles Traveled (VMT)

Calculated by multiplying the number of vehicles using a roadway link by the length of roadway link. This common measure of how much travel occurs says nothing about travel quality.

Travel time: Vehicle Hours Traveled (VHT)

Calculated by multiplying the number of vehicles on a road link by the time spent on the link. It does not address the nature of the time spent.

Delay: Vehicle Hours of Delay (VHD)

Calculated by comparing travel time without congestion (free flow) to travel time with congestion. A trip may be two hours with congestion and one hour without congestion, yielding one hour of delay.

Transit ridership

The counts of transit ridership on all existing and proposed transit networks in a scenario, broken out by bus, commuter rail, and other rail (heavy and light).

Vehicular emissions of GHG

These primarily comprise three measured GHGs - Atmospheric CO₂, Methane (CH₄), and Nitrous Oxide (N₂O). They are expressed in terms of Carbon Dioxide equivalents (CO₂Eq), a combined measure of GHGs weighted according to the global warming potential of each gas, relative to CO₂. Among the criteria pollutants, we output emissions of Nitrous Oxides (NO_x) and Volatile Organic Compounds (VOCs).

Value-Explicit Presentation of Findings

We have sought to be sensitive to language and value bias in presenting our findings. For example, we use the word “decentralization” rather than the “sprawl.” In a similar vein, increased traffic is often considered a negative impact because it generates more pollution, wasted time, and congestion. But more traffic throughput on a freeway can also be interpreted as an economic development gain for a region, implying more freedom of movement and choice for employees and employers and so we make this point explicitly when presenting results. Furthermore, fleet electrification and autonomous vehicles, with their lower emissions and increased road capacity, could upend the typical negatives associated with increased traffic, travel time, and delay. We thus note explicitly that in an AV world, delay should not be viewed in the conventional way.

Existing Conditions and Baseline Projections

We compare our scenario results not to current conditions (the travel model’s base year of 2015) but to a future in 2040, called the baseline. While this makes for a useful apples-to-apples comparison, it requires an imaginative leap. To support that leap by grounding the reader in current realities, this section provides a snapshot of where population and travel measures are today and in the 2040 baseline.

Our baseline scenario incorporates the study area’s population, housing, and jobs projections, as officially adopted by the region’s two Metropolitan Planning Organizations (BMC and MWCOG). These projections are reflected in the 2040 baseline indicators. But because our modeling links the population and land use effects of transportation or land use policy changes, our scenario projections vary slightly from the “official” baseline projections (Figure 4).

Population Distribution with and without AVs

Using SILO, we model existing and projected population distribution in the region with and without AVs, but without adding lanes, tolls, or transit, which is done later in the scenarios. Unlike population, job locations are held constant in our 2040 scenarios and reflect official State projections. Job projections reflect an annual average increase of 1 percent per year while population increases at a much slower pace, about 0.25 percent per year. Figure 4 shows the 2015 and SILO-projected 2040 populations for the subareas and their change over this time.

In both 2015 and 2040, about 40 percent of the region’s more than 10 million people are located in the six-county inner subarea. Since the added toll lanes run through this subarea, it may be expected to experience the largest impacts. This, however, is not the case.

Figure 4. Existing and Projected Baseline Population

	Population				
	2015	2040		Change	
		No AVs	25% AVs	No AVs	25% AVs
Core	2,259	2,576	2,535	317	276
Inner	6,098	6,334	6,299	236	201
Outer	1,573	1,769	1,813	196	240
Region	9,930	10,678	10,647	748	717
External	4,672	4,931	5,029	258	357
Total	14,602	15,609	15,676	1,007	1,074

1/1000

We find that development patterns respond strongly to the accessibility changes generated by AVs—increased highway capacity, reduced travel time penalties, and a reduced value of accessibility—by pushing new growth farther out. Without AVs, the increment of growth going to the outer and external subareas totals 49 percent; with AVs it totals 57 percent, an increase of 8 percent. This, of course, is the same growth percentage lost by the core and inner subareas. These percentages equate to about 100,000 people who are redistributing themselves.

Traffic Conditions without AVs

In 2015 and 2040, Vehicle Miles Traveled (VMT) in the Baltimore-Washington region (the core, inner, and outer subareas) amounts to about 60 percent of all VMT in the study area, impacting a very large portion of drivers. Figure 5 shows travel indicators in 2015 and in 2040. Most striking in the projections is the virtual doubling of delay on all roads in the region. This highlights the importance of addressing congestion in our scenarios.

Figure 5. Existing and Projected Traffic Conditions

		2015	2040	% Change
VMT	Freeways	22,388,116	25,390,851	13.41
	Other Roads	26,103,701	32,391,042	24.09

	Total	536,258	1,024,319	91.01

1/1000

The Scenarios and their Impacts

Given the relatively slow rate projected for population growth, we would not normally expect dramatic population shifts or travel pattern changes over the 2015 to 2040 timeframe. In land use-transportation studies of large metropolitan regions with modest rates of growth, changes in travel indicators are typically in the plus-or-minus 5 to 15 percent range. In this study, however, we test policies that add significant capacity to two key freeways, assume that AVs enhance capacity on these freeways, and also include a strong smarter growth scenario. We may, therefore, expect to produce much larger changes in travel patterns than usual.

In experimenting with tolls, we found that travel behavior is very sensitive to toll pricing. Accordingly, we assume a moderate, fixed, three-hour peak toll charge of \$0.40/mile for the proposed toll roads. In the smarter growth scenario, we also add significant new transit capacity (Figure 10 on page 10) and remove the added tolled freeway lanes included in the other scenarios. This reveals the effects of land use and transit changes without any new lanes. We test smarter growth in both AV and non-AV futures to see their separate effects.

Population Impacts

The study area will grow by just over one million people, from 14.6 million in 2015 to 15.6 million in 2040. The metropolitan region is anticipated to grow by between 713,000 and 783,000 people. We earlier presented the distribution of this growth for the baseline condition. Figure 6 shows how our different scenarios affect population shifts in 2040.

Toll Lanes vs. AV Impacts

Adding tolled lanes, but not AVs, significantly adds to growth in the external areas (22 percent more than baseline) and shrinks it slightly in the core and inner areas. With more freeway capacity, people choose to decentralize. Interestingly, just adding AVs has an even stronger decentralization effect in the external subareas (38 percent). This reduces core and inner area growth more noticeably, by about 30 percent, or about 80,000 people. Adding tolled lanes to the AV scenario has a similar decentralizing effect (42 percent).

Impacts of Changing Development Capacity

SILO shows that AVs strongly encourage decentralization. In the absence of AVs, however, the housing market's strong pressure for growth in the inner and core subareas is very evident when these subareas' development capacity is increased by 20 percent, as in the SG scenario. Almost a third more people move into these subareas than in the baseline case. When AVs are added into the mix, however, and all

subareas increase their capacity by 20 percent, then the centralizing effects of SG are much dampened, with only 7 percent more people in the core and inner areas than in the baseline, but decentralization is still strongly checked (only 15 percent move to the external and outer subareas vs. 62 percent in the AVs only case). This scenario also attracts slightly more people into the region and many more into the study area—over 800,000. Within the region the smarter growth policy grows the core and inner areas by one third more than the baseline case, equating to about 93,000 people. This recentralizing effect is much reduced when the policy is coupled with AVs.

A 2007 study⁷ suggested that significant freeway lane additions might show, on average, a 9% shift in land uses after eight years, with the great majority of shifts falling between 0 and 18%. Our analysis is in the ballpark with an overall maximum population shift of 5%. This same research suggested that much of the new capacity from new freeway lanes does not remain freely available but is absorbed by general growth in population and jobs as well as through route shifts, mode shifts and time of day shifts in response to the new capacity. Our models capture all these shifts except time of day shifts.

7. Avin, Cervero, Moore and Dorney, Program Forecasting the Indirect Land Use Effects of Transportation Projects, National Cooperative Highway Research, 2007

Note that while population changes imply land use change, these relationships are not proportional in terms of land consumption. Land consumption from population growth in the core is limited and is often achieved through redevelopment while population growth in the outer and external subareas is typically at low densities. In short, adding AVs has much more impact on population redistribution patterns and, as we'll see, on travel behavior than the added lanes.

Travel Impacts

Results from the travel indicators should be viewed in relation to each other to properly understand their impacts. For example, increases in travel miles (VMT) would likely be accompanied by increases in travel time (VHT), although if there are more trips, but they are faster, travel time could actually decrease. This may or may not produce more delay (VHD) depending on road capacities. More traffic and increased travel time but on an expanded road network may actually still yield reduced delay.

Figure 7 is composite summary of all regional and subregional impacts. The figure shows percentage change compared to the baseline. The actual numbers are presented in Appendix C and other additional data are on the project website. In our narrative, we use the terms significant, moderate etc. consistent with the numerical thresholds of the color legend of Figure 7.

The two left hand columns of Figure 7, showing results with conventional vehicles (No AVs), supports our earlier observation that most transportation studies in large, mature regions yield insignificant (<5 percent change) to moderate (5 to 15 percent change) travel behavior impacts. This picture changes noticeably, however, when we look down the 25 percent AV columns and see numerous instances of changes in the significant (>15 to <25 percent) and very significant (+25 percent) categories, especially in freeway delay changes, and most markedly at the subarea scale.

In several of the scenarios, the core realizes the most reductions in travel time and delay, especially on freeways. The inner subarea realizes increases in travel changes, except for some significant freeway reductions. The outer subarea sees some of the largest increases or decreases. Results for

Legend: Percentage Changes from Baseline		
<-25	25+	Very Significant
-15 to -24.9	15 to 24.9	Significant
-5 to -14.9	5 to 14.9	Moderate
-0.1 to -4.9	0 to 4.9	Insignificant

The Region

At the regional scale, without AVs, the traffic impact of adding freeway toll lanes is insignificant—traffic and travel time increase marginally. In the smart growth scenario, traffic and travel time also increase very slightly but delay increases notably. Inserting AVs magnifies the impacts on traffic and travel time and, notably, on delay, where significant freeway traffic reductions are counterbalanced by significant arterial/collector increases in traffic. This outcome seems puzzling. Typically, one would expect to see the added capacity on freeways result in delay reductions on local roads as more traffic is attracted to the freeways. This does happen in the No AV tolls scenario where freeway delay drops by 4 percent and other roads reduce by almost one percent. As noted, however, AVs, both increase freeway capacity and reduce the value of time and these two factors together reduce freeway delay significantly but because travelers care less about delays, and choose these shorter and cheaper routes overall, we see an increase in delay on other roads.

Note that, regionally, adding toll lanes with AVs has very similar delay reductions to just adding the AVs alone. Coupling AVs with SG, however, yields similar delay on freeways but does not increase delay on other roads as much. This is also a seemingly a puzzling outcome. The explanation is that the combined effects of SG's shorter work trips (concentrating more people in the core and inner subareas, near most jobs) plus the transit enhancements cause these large reductions in delay. These large impacts are masked by the insignificant reduction in overall delay.

Adding tolled lanes doesn't affect transit ridership overall but adding AVs significantly reduces it. GHG impacts range from insignificant reductions from tolls plus SG to moderate increases from AV plus tolls.

Outer Subarea

This subarea is the most affected by the various scenarios. As the least populous (1.5 million people) of the subareas and the farthest from job centers, the impacts of changes in population and transportation loom largest here. The large reduction here in population (30 percent) in SG (No AVs), for example, helps explain the slight lessening of traffic impacts. The contrasts between No AV tolls and 25 percent AV tolls is very striking but the tolls add very slightly to the overwhelming impact of AVs. The AVs result in very big differences in travel behavior—moderately increasing traffic, very significantly increasing travel time and dramatically increasing congestion. This congestion, however, really occurs on arterials and collectors, while freeways actually see significant reductions in delay. SG plus AVs seem to capture the best of both worlds with generally moderate increases in traffic, travel time, and delay but very significant reductions in freeway delay. Transit, especially rail, sees very significant percentage reductions in ridership under AV and AV tolls, reflecting the small existing ridership base. However, transit from SG (with No AVs) realizes very significant increases, especially in buses. The AV and AV plus tolls scenarios moderately increase GHG.

Inner Subarea

In this subarea, adding tolled lanes has an insignificant effect on traffic, travel time, and delay. Only SG has some impact, causing moderate to significant increases in travel time but significant to very significant increases in delay, especially on other roads. With AVs, traffic increases moderately overall but significantly on freeways. Tolled lanes cause a moderate increase in travel time. AVs cause a slight decline in travel time but have a very mixed impact on delay, reducing it significantly on freeways but significantly increasing it on other roads. We addressed these unusual outcomes when explaining the similar results for the region overall. Adding tolls does not change these mutually offsetting impacts. In this subarea, SG plus AVs reduces freeway delay even further but with an insignificant increase on other roads for an insignificant reduction in overall delay. Transit use is essentially unaffected by the tolls but all AV scenarios reduce ridership. Only SG strengthens transit but this is cancelled when coupled with AVs. GHG emissions are unaffected by tolls and SG; adding AVs, with or without tolled lanes, moderately increases emissions.

Core Area

As in other subareas, the toll lanes have an insignificant effect on traffic, travel time, and delay. Inserting AVs, however, with and without new lanes, confers on the core the region's most significant percentage reductions in delay, albeit small in absolute terms (Figure C.4). Only the core subarea realizes significant travel time and delay reductions from SG, with or without AVs, but these do not approach the reductions of AVs alone or AVs plus tolls. Shorter trips and enhanced transit likely account for these SG benefits. Transit is unaffected by the toll lanes and is very significantly enhanced by SG, but this gain is cancelled by coupling SG with AVs. The core benefits the most of any subarea in GHG reductions from all scenarios, most significantly from SG, but insignificantly from AVs plus tolls.

Interstate 495

Adding just the extra lanes causes traffic to increase moderately, as expected, but travel time to drop slightly; delay, however, is very significantly reduced, by over a third (Figure 8). SG produces moderate to significant declines in traffic, travel time, and volumes but no real reduction in Beltway delay. Inserting AVs attracts significantly more volume but a lot less than adding the toll lanes. Adding tolls plus AVs, however, boosts volumes, which then equal those induced by the lanes alone. Travel time increases moderately with AVs but is halved by the addition of toll lanes. Reductions in delay from AVs alone are moderate but adding toll lanes reduces delay very significantly—by one third. SG produces moderate increases in traffic, insignificant declines in travel time and moderate declines in delay. (See Figure C.5 in Appendix C for data comparing traffic volumes and congestion on the free vs. the toll lanes.)

Figure 8. Summary of Scenario Impacts: I-495

I-495 % change	No AVs		25% AVs		
	Tolls	SG	AV	Tolls	SG
Traffic	14.6%	-6.5%	21.0%	30.0%	7.0%
Travel Time	-6.3%	-7.1%	8.4%	4.4%	-3.6%
Delay	-35.9%	2.7%	-10.2%	-32.7%	-12.9%
Total Volume	19.9%	-2.3%	20.0%	33.2%	10.6%

Interstate 270

Toll lanes add a moderate amount of traffic but no travel time to this interstate compared to the Beltway (Figure 9). The new toll lanes also carry a smaller percentage of the traffic than do the Beltway's (Figure C.6 in Appendix C). The new lanes do reduce congestion very significantly, by over a quarter. Interestingly, SG moderately reduces congestion in this corridor. Adding AVs amplifies these impacts and adding the toll lanes does so even more, yielding a reduction in delays of almost a quarter compared to the baseline. Implementing SG without lanes but with AVs produces moderate reductions in delay compared to the baseline. (See Figure C.6 in Appendix C for data comparing traffic volumes and congestion on the free vs. the toll lanes.)

Transit Impacts

The transit additions in the SG scenario are extensive (Figure 10) but are limited to major rail transit system expansions. For the Smarter Growth scenario, the MARC commuter rail line was expanded to Elkton, MD and the VRE was extended to Gainesville, VA. In addition, the Baltimore Red Line, that runs east-west through the Baltimore region, was added while a Core Loop line was added to the DC Metro. Also, MARC and VRE commuter rail lines were merged. We did not add or modify bus routes. While transit impacts were noted in the traffic impacts for each subarea, this section brings these impacts together for an overall perspective.

The great majority of transit trips (81 percent) captured in our model are via heavy rail (Metro) and light rail. Only 2 percent are via commuter rail (MARC and VRE). Our model understates transit ridership, particularly for buses, because our mode-choice model does not consider car ownership as a factor and thus doesn't properly capture transit dependent populations, especially prevalent among bus riders. We made no extra efforts to allocate growth or jobs to TOD areas. Neither did we adjust the first mile/last mile interface or service characteristics such as frequencies to improve transit performance.

In the baseline, 57 percent of the region's projected 2040 peak hour transit trips occur in the inner suburbs, 41 percent in the core and only 2 percent in the outer subarea. The very small existing ridership in the outer subarea explains why scenario impacts there are so large in percentage terms.

In general, adding toll lanes reduces transit use only marginally (Figure 11). SG significantly increases transit use (above 20 percent) in all transit modes, especially in the outer subarea. Introducing AVs, both with and without toll lanes, significantly reduces transit ridership by just over 20 percent regionally, most in the outer subarea (approaching 30 percent) and least in the cores (around 18 percent). Coupling SG with AVs cancels out transit ridership increases, leaving transit ridership essentially the same as in the baseline.

GHG Impacts

Figure 12 shows the GHG impacts in terms of carbon dioxide equivalent (CO₂Eq). For the detailed emissions output, please see the project website. Note that GHG impacts accrue at a global level, making them the primary measure used in evaluation of climate change mitigation efforts. The impacts of criteria pollutants such as Nitrous Oxides (NO_x) and Volatile Organic Compounds (VOCs), on the other hand, accrue at a local level varying spatially, making them the primary measure of air quality, thus closely related to public health.

We see a wide range in emissions. Regionally, they range from insignificant to moderate. Apart from vehicle and fuel characteristics, GHGs are a function of congestion and driving patterns, which can be increased by stop-and-go and high-speed driving. (While emissions impacts move generally in the same direction as traffic, they don't mirror traffic because of these factors.) In the baseline, 57 percent of the region's projected 2040 peak hour transit trips occur in the inner suburbs, 41 percent in the core and only 2 percent in the outer subarea. The very small existing ridership in the outer subarea explains why scenario impacts there are so large in percentage terms.

The core exhibits the most dramatic impacts with significant declines in all scenarios but most markedly for smarter growth. This reflects shorter commute trips and more transit use in the core. The outer subarea sees some of the most significant impacts, reflecting increased AV travel and the large percentage increases in traffic above low baseline traffic. The differences in emissions among scenarios in the entire study area are insignificant, however - under one percent in non-AV or just over 2 percent in AV conditions. The project website provides the actual numbers behind the percentages.

Key Findings

The previous sections compared the impacts of several transportation and land use scenarios for the Baltimore-Washington region and described their impacts in some detail at both the regional and facility levels. Here we try to synthesize our key findings from this analysis and move them toward policy options that can work across all scenarios as well as those that will work for more specific outcomes.

Impact of AVs on Regional Travel

The analysis clearly shows the potentially significant impact of AVs on regional traffic and development patterns. In fact, given AVs, a technology bound to become more commonplace, adding lanes makes little difference to travel outcomes. Regionally, AVs alone or AVs plus toll lanes both attract moderate amounts of new traffic (8 and 10 percent respectively) and increase delay by similarly moderate amounts (13 and 14 percent respectively). However, they reduce regional freeway delay by a significant amount (20 and 19 percent respectively). And while they manage to add traffic and still reduce freeway delay, they also significantly increase traffic delay on the region's local roads (22 and 23 percent respectively). These countervailing impacts make for a difficult tradeoff, even though the value of time is reduced in an AV world.

The significant impact of AVs raises the the whole cost-benefit question of building tolls if AVs are on the horizon. One answer is that on the Beltway and I-270, AVs and AVs plus toll lanes have much greater impacts than they do at the regional scale and these impacts suggest different policy decisions and actions.

Impact of AVs Plus Toll Lanes

On the Beltway, adding lanes attracts more traffic than AVs alone (30 vs. 21 percent) but provides three times the reduction in delay than AVs alone—a decrease of 33 rather than 10 percent. On I-270 the differences are less dramatic. Adding lanes attracts less traffic than AVs alone—21 vs. 15 percent—but doubles the reduction in delay that AVs alone provide—24 vs. 14 percent.

Impact of AVs Plus Smarter Growth

What is the impact of AVs when combined with smarter growth land use strategies? Regionally, smarter growth attracts less traffic into the region than AVs plus toll lanes (3 vs. 10 percent) and reduces regional freeway delays slightly more than AVs plus tolls—22 vs. 19 percent. Moreover, local traffic does not increase, and the region overall sees delay increase only insignificantly.

These benefits are not as marked for the Beltway and I-270. This scenario only provides a third of the congestion

relief on the Beltway compared to the AV plus tolls scenario (a 13 percent reduction vs. a 33 percent reduction). Similarly, on I-270, SG plus AVs yields a 15 percent reduction in delay vs. a 24 percent reduction with AVs plus tolls. On the other hand, SG plus AVs adds only 12 percent to I-270 traffic vs. 21 percent for AVs plus tolls.

Tolls and Smarter Growth Without AVs

But what if AVs are not going to arrive anytime soon? Then we have a rather different set of impacts and possibilities to consider. These vary by region and road.

At the regional level, toll lanes and SG make very little difference in freeway or arterial road traffic. Tolls very slightly reduce delay on freeways and other roads. SG adds a moderate 6 percent to freeway delay but adds 12 percent to overall delay because of increased delays on arterial roads. SG seems to fare poorly as a delay reduction strategy at the regional level.

On the Beltway and I-270, the differences between tolls and SG impacts grow. On the Beltway, tolls increase traffic by a significant 15 percent while SG decreases traffic by 7 percent. Delay is a different story. Tolls reduce delay on the Beltway by a very significant 36 percent while SG increases it insignificantly (3 percent). Traffic and delay impacts are less clear on I-270. Here, tolls increase traffic moderately—by 12 percent, but SG reduces it slightly—by 2 percent. Tolls and SG both reduce delay, but tolls achieve a very significant reduction of 29 percent and SG achieves only a moderate reduction of 6 percent.

Scenario Impacts in Summary

Figure 13 summarizes all the above impacts at both the regional and facility scales. Regionally, without AVs, the toll lanes help a little, SG does not. The impact of 25 percent AVs is similar to those of tolls; both help freeways but worsen local travel; SG helps all round, sometimes more, sometimes less. At the facility level, the summary suggests that tolled lanes make sense on the Beltway under any of the future scenarios considered; they provide more congestion relief regionally and at the facility scale than SG. On I-270, while tolls still perform better than AVs or SG, their relative benefits are less pronounced and therefore the cost-effectiveness of this initiative is open to question.

Figure 13 implies some appropriate strategies if congestion reduction were the primary criterion for policy choices. But it is fair to ask how much reduction is enough. At 65 mph, it only takes an additional 20 percent in traffic to drop from the good Level of Service C to a less desirable LOS D, but from there, another 13 percent increase in traffic brings us to a poor LOS E. In other words, traffic reductions of 15 percent may be adequate, depending on the congestion level, if the cost of getting to a 25 percent reduction is extremely high.

Beyond congestion, there are other indicators that should be weighed in policy making against one's concerns and values. Some of those we've presented in this study and we summarize in Figure 13. Note that we show more traffic as a negative impact although increased traffic throughput can be viewed positively as well. As noted earlier, the importance of delay may be moot in an AV world.

Figure 13. Generalized Summary of Scenario Impacts

		No AVs		25% AVs

Policy Recommendations

Facing ever-increasing congestion, should Maryland invest in new tolled lanes, in smarter land use, or let things play out as AVs begin to shape a new reality? Is there some combined approach that can provide both robust and contingent strategies for an uncertain future? To help sort the jigsaw of outcomes and shift the previous section's key findings into policy directions, we surface five recommendations. The first two recommendations affect decision-making in the short and medium terms. The other three are longer term policies in response to the advent of AVs.

Revisit toll lanes in light of AVs.

By 2040, a 25 percent ownership rate of AVs and a resultant 25 percent increase in freeway lane capacity, seem like reasonable, even conservative, assumptions. Since even this modest level of AV adoption yields significant reductions in delays, especially on freeways, the AV trajectory must be considered seriously as substituting for toll lanes. Monitoring their progress and preparing for their adoption is crucial. The State has a role in shaping how AVs use the roadway system with actions such as incentives for shared fleets, ZEVs, new types of curbside management, and disincentives for single-occupancy vehicles in denser neighborhoods. This suggests that I-270 could be the State's pilot corridor to explore different AV approaches—personal, shared, transit-supportive, electric and combinations thereof.

Decouple decision-making on I-495 and I-270.

Based on our findings, summarized in Figure 13, the case for toll lanes on I-270 is somewhat weaker than for I-495. Their different impacts suggest that separating the implementation and phasing of the toll lanes requires further research and that other options for traffic management in the I-270 corridor deserve more consideration.

Provide more housing capacity in the cores and inner suburbs.

Since AVs will increase development pressure on the outer subareas and beyond the region, land use measures to increase the development capacity of the inner and core subareas must be considered. More capacity, including modest expansion of urbanized areas or increasing infill and redevelopment capacity, will mitigate congestion, support transit, and help relieve high housing prices. Housing demand in these areas is substantial and will remain so, as evidenced by escalating housing prices (see Appendix A for prior NCSG work on this point) even when some households choose to live farther out.

Anticipate development pressure from AVs on the outer suburbs and hinterlands.

Some outer jurisdictions may choose to accommodate this growth and some may resist. If most resist, regional housing prices may rise faster and farther flung counties and neighboring states may absorb this growth. If jurisdictions accommodate this growth, new forms of rural and suburban clustering and innovative public or private utilities and technologies may be needed.

Develop smarter growth and expanded transit as surgical initiatives, not blanket policies.

Maryland's land use is already concentrated within and around its metropolitan beltways and local land use planning has implemented this concentrated pattern for over four decades. We find that further intensifying that pattern across the board while concurrently investing billions in heavy rail transit expansion increases congestion significantly in the inner suburbs, does not relieve it in the core (though it lowers emissions there), but does boost transit ridership. These transit gains would be undermined by AVs without any strong mitigation and adaptation policies. Therefore, both selective densification and transit expansion must be careful initiatives to balance cost-effectiveness, equity considerations, and broad public benefit (See Appendix A for prior studies which address this point).

Appendices

Appendix A. Findings in Perspective

The nexus of transportation, land use, and sustainability has been a topic of considerable interest in the Baltimore-Washington region over the past 15 years. The NCSG has conducted several in-depth studies that address these issues. Our findings in this report are generally consistent with our prior work. These previous studies also created scenarios that systematically varied aspects of the future and then tested their impacts using simulation models. Our previous scenarios, for example, have varied transportation investments, economic assumptions, travel costs, development capacity, and transit-oriented development intensity. On the output side, we have measured impacts such as travel characteristics, land use change, environmental impacts, housing affordability, and mobile and building emissions (See *Engaging the Future*, 2018). Figure A.1 summarizes the findings of these prior studies in the Baltimore-Washington region.

All these studies find that pricing mechanisms have the greatest impact on travel behavior, consistent with other studies. The greatest reductions in highway congestion result from a regional network of toll roads. Where new toll roads parallel non-tolled roads they provide congestion relief on the non-tolled roads by drawing traffic onto the tolled segments. (Note that the introduction of AVs changes these relationships). Changing transit headways and fares has minimal impact on transit ridership; however, significant increases in transit speed can have a major impact on transit ridership. Changes in land use such as transit-friendly development can have a small impact, provided it is strategically located, but the fact that most future land uses are already in place very much dampens the impacts of land use change. Finally, all of these studies were done with behavioral models that rely on somewhat old survey data (i.e. 2008) and do not include newer options such as ridesharing, microtransit, BRT, micromobility etc.

Figure A.1 Findings from Prior NCSG Studies

Projects, Sponsors, Dates	Variables Adjusted	Key Outcomes and Findings
Maryland Scenarios MDOT 2010-2012	Land use location, transit speeds and fares, toll roads	<ul style="list-style-type: none"> Increasing transit speed has the greatest effect on shifting travel from vehicle to transit, thus reducing freeway travel, and thereby VMT and VHT. Reducing transit fares and headways has small impacts on transit use. Toll road revenues rise, then fall with toll increases. Maximizing toll road revenues is not always best for congestion reduction. New, transit friendly development has modest impact on total travel, since most development in 2040 is in place today.
PRESTO Engaging the Future Town Creek Foundation 2013-2018	Fuel cost, technology innovation (AVs), land use regulations (zoning)	<ul style="list-style-type: none"> Development capacity (zoning) and its location proves important given development capacity constraints of the inner suburbs. AVs significantly reduce transit use, especially outside the core and inner suburbs. Favoring forest land protection over farmland protection reduces nutrient runoff. For GHG building emissions, retrofitting existing structures is more effective than merely constructing new green buildings.
Two Decades of Smart Growth in Maryland Urban Planning and Transport Research, Rolf Moeckel and Rebecca Lewis, NCSG affiliates 2017	New development only in PFAs/new development only in TODs auto operating costs increased/ parking costs doubled	<ul style="list-style-type: none"> Transit ridership increases by 1% in TOD scenario. Increased auto operating costs marginally increase transit ridership. Travel (VMT and VHT) increase in PFA and TOD scenarios.
Regional Scenarios Greater Washington Partnership 2017-2019	Toll network, rail schedules and speeds, cordon fees to enter downtown DC.	<ul style="list-style-type: none"> Population and employment locations were the same in all scenarios, with the greatest congestion reduction from a toll road network; but toll roads can cause congestion on access routes. The cordon benefits downtown DC but causes congestion elsewhere. Faster rail service may relieve congestion on parallel routes.

Appendix B. Comparison with the MDOT Study

[This analysis was conducted before MDOT’s release of the July 2020 DEIS for the Managed Lane Study]

In September 2017, Maryland’s Governor announced planning for a Traffic Relief Plan (TRP), a \$9+ billion project described as the largest public-private partnership (P3) for highway construction in North America. The plan aims to reduce Maryland’s lengthy commute times, high congestion rankings, and the increasing financial burden of congestion by expanding some key highways in the greater Baltimore-Washington region.

The TRP proposals have been advanced through MDOT’s Managed Lanes Study that is focused on the Beltway and I-270. We use one of the stronger-performing alternatives in that study, Alternative #9, for our comparisons. This alternative would add four new tolled “express” lanes on each of those highways (two in each direction), while retaining the existing footprint of untolled lanes on each road. The planned additions in Maryland would be coordinated with recent investments in highway infrastructure in neighboring Virginia. I-495’s course around Washington through its suburbs takes it twice over the Potomac River. Facing ever worsening

traffic congestion and continued economic and demographic growth, Virginia chose to invest in highway expansion through P3 projects in the early part of the last decade and has now mostly completed a similar expansion of its regional highways. In Virginia, I-495, I-95, and I-395 have been expanded with added toll lanes; and by 2022, I-66 west of I-495 will have been expanded in a similar fashion.

The current MDOT study for the TRP cites the reduction of congestion as its primary goal and states that indirect effects will be improved regional economic competitiveness and savings in personal travel time and cost. While our study, using different methods and tools, incorporates an analysis of the TRP’s congestion impacts, we have also looked at other impacts. These include probable indirect population effects, the likely impact of autonomous vehicles, and the impacts of a smarter growth land use/transit initiative. Despite different models and methodologies, our results show similar impacts to MDOT’s or at least ones that move in the same direction, despite specific differences. The MDOT results shown in Figure B.1 are culled from information presented by MDOT at a public meeting in Spring 2019.

Figure B.1 Comparison of MDOT TRP and NCSG Outcomes

MDOT feature compared	TRP	NCSG	Comments
Percent increase in people moved vs. 2040 no-build “people through-put”	+10%	+13%	We assume these indicators measure actual increases in volume comparing our pm peak to MDOT’s.
• I-270 at Montrose Road			
• American Legion Bridge (north side)	+35%	+30%	
• I-495 west of I-95	+40%	+11%	
• I-495 at MD Route 5	+15%	+3%	
Congestion relief (reduction in delay) on combined facilities (I-495 and I-270) at pm peak	-33%	-27%	Seems like a straightforward apples-to-apples comparison.
Reduced daily delay on local network	-6.8%	-1.0%	We use regional pm peak combined reduction for arterials and collectors, not daily reduction.

Appendix C. Population Impacts

Figure C.1 shows the entire study area population by subarea for 2015 and as projected to 2040 by scenario. It also presents this information as percentages of the total population by subarea and scenario. Of note are the relatively small percentage changes when seen as part of the total population rather than as part of the incremental growth as in Figure 6.

Figure C.1 Share of Incremental Population Growth by Subarea

Appendix D. Travel Analysis

The five scenarios were evaluated using the following indicators:

- Population growth shifts
- Traffic (measured as Vehicle Miles Traveled or VMT)
- Travel time (measured as Vehicle Hours Traveled or VHT)
- Delay (measured as Vehicle Hours of Delay or VHD)
- Transit ridership
- Vehicular emissions

The sections below offer a more detailed and complete narrative than that in the body of the report. Each area's results are described in the order of the indicators, first for without AVs, then with 25 percent AVs. These tables show absolute values while those in the body of the report show percentage change from the baseline.

D.1 The Region (see Figure D.1)

Travel Impacts without AVs. Adding toll lanes does not affect overall regional VMT although it increases it slightly on freeways (1.6 percent). Likewise, the effects on VHT and VHD are marginal; although a small decrease (4 percent) is registered for freeways, likely the result of the added toll lanes drawing traffic from the free lanes. This pattern generally holds in the other subareas as well. Transit ridership is unaffected by the added lanes.

In a smart growth scenario (adding transit, no new lanes), VMT is essentially unaffected but freeway VMT decreases 2 percent and VHT overall increases 5 percent. VHD, however, increases substantially (13 percent), likely the result of increased population concentration in the core and inner subareas, where drivers use already-congested roads, and the larger growth increment resulting from SILO's indirect transportation impacts that attract more people into the region.

SG's population redistribution and transit expansion also contribute to a significant increase of 22 percent in transit ridership, spread evenly across all modes. Adding tolls doesn't affect transit ridership but assuming AVs significantly reduces it. GHG impacts show marginal reductions from added tolls and from SG.

Travel Impacts with AVs. Adding AVs changes results across the board. Even without added toll lanes, they add 8 percent to regional VMT, mostly due to more freeway travel (14 percent). With toll lanes, the AV effect

increases both overall and freeway VMT by only 2 percent (from 8 to 10 percent and 15 to 17 percent). In other words, introducing AVs has a much larger impact than adding toll lanes on regional travel behavior. Adding AVs increases VHT by 9 percent; AVs plus toll lanes increases VHT by 10 percent, particularly on collectors.

The impacts on regional delay are interesting. AVs alone increase VHD by 13 percent overall but is reduced by 20 percent on freeways. This riddle is explained by the equally large increase in delay on arterials and collectors. Travelers will tolerate delay on arterials and collectors to access faster travel on freeways. This same pattern is evident when adding toll lanes; delay increases 14 percent overall, freeway delay declines by 19 percent, while arterial and collector delay increases by 22 percent. AVs, with or without added toll lanes, also reduce transit trips—overall by 19 percent and on rail

between 21 and 27 percent.

In the SG scenario, introducing AVs has a small impact on VMT—a 3 percent increase overall and a 7 percent increase on freeways. The SG plus AV scenario’s impacts on delay are noteworthy; overall delay is increased by 2 percent but freeway delay is reduced by 21 percent, reversing the 6 percent increase in congestion from SG alone. Without added lanes and using a SG population distribution brings transit ridership back to the baseline.

AVs plus tolls generate a moderate increase in GHG impacts.

Figure D.1 Regional Outcomes by Scenario

D.2 Outer Subarea (see Fig. D.2)

Travel Impacts without AVs. With only 11 percent of the baseline population, these 11 counties still generate about 26 percent of regional peak hour travel (VMT). This is because residents commute longer distances to central job locations and have few transit options. Since the new lanes are far from these outer jurisdictions, however, they have almost no effect on VMT, VHT, or VHD.

SG produces a modest increase in VMT and VHT of 4 and 5 percent respectively. It also decreases overall delay by 5 percent and freeway delay goes down 11 percent.

Transit ridership is unaffected by added lanes, but the SG scenario generates more impact in the outer subarea than anywhere else; overall ridership increases by 44 percent with buses being the beneficiary of a massive increase in ridership (see transit ridership by mode on the project website). This anomaly is a result of a very small existing base of bus ridership in this subarea.

GHG emissions are reduced only marginally from tolls plus SG.

Travel Impacts with AVs. Adding AVs increases VMT significantly—13 percent overall and 15 percent on freeways. New toll lanes reduce this marginally. VHT increases even

more, by 26 percent, especially on arterials and collectors, and adding the tolled lanes slightly increases these numbers. VHD sees the biggest increases, 51 percent without new lanes and 52 percent with them. VHD also increases very significantly on arterials and collectors, between mid-50 and mid-60 percent, with or without toll lanes. These are among the largest percentage impacts found in this study and can be attributed to the relatively small existing population base. Freeways, on the other hand, decongest by 22 percent without toll lanes and 14 percent with toll lanes. In the outer suburbs, longer distance trips benefit at the expense of more local trips, more markedly than in any other subarea.

Coupling SG with AVs delivers the “best” travel outcomes in the outer subarea: small increases in VMT and VHT (4 and 6 percent respectively), very significant VHD reductions on freeways (30 percent), but with significant increases in overall delay (21 percent). Transit use increases by 6 percent overall, but bus ridership increases by 62 percent.

Transit ridership suffers losses of 21 percent with AVs alone and 26 percent with added lanes, most notably for rail, with buses much less affected (losses of between 5 and 8 percent).

GHG shows moderate increases in the AV and AV plus tolls scenarios.

D.3 Inner Subarea (see Fig. D.3)

Travel Impacts without AVs. This subarea produces 60 percent of all regional VMT giving it an outsized effect on regional travel behavior. As with the regional and outer subarea impacts, adding toll lanes has almost no effect on overall VMT, VHT, and VHD. Freeway VHD stands out here, declining by 5 percent.

SG has progressively larger impacts, from a minor increase in VMT of 4 percent, a notable increase in VHT of 13 percent, and a very significant increase in VHD of 25 percent.

Transit ridership, as in the other subareas, is unaffected by the added lanes. SG produces modest 16 percent increase here, transit being more established than in other subareas.

GHG is essentially unaffected in the no-AV policies.

Travel Impacts with AVs. As in the region and outer subarea, adding AVs alone increases VMT overall (8 percent), especially on freeways (15 percent). AVs plus toll lanes increases these

impacts marginally. A similar pattern is evident in VHT and is spread more evenly across road types. Unlike the outer subarea, overall VHD impacts are moderate (8 percent increase without tolled lanes and 10 percent increase with lanes). A reduction in freeway VHD (16 percent) is more than offset by increased delays on arterials and collectors, though much less than the percentage reductions in the outer subarea. The large existing population and established travel patterns mute the impacts of added growth.

SG plus AVs marginally increases VMT (2 percent) and marginally reduces VHT (3 percent). The interesting impacts occur in VHD where overall delay is reduced by 4 percent but freeway delay goes down by a significant 22 percent. Transit ridership drops the same amount with AVs and with AVs plus toll lanes (20 and 21 percent respectively). SG plus AVs restores ridership to the baseline.

GHG increases moderately in the AV scenarios and only marginally in the SG scenario.

D.4 Core Area (see Fig. D.4)

Travel Impacts without AVs. This subarea contains about 26 percent of the region’s population and produces about 23 percent of its VMT. Adding the tolled lanes has a marginal effect on VMT, VHD, and VHD.

However, in this subarea SG pays dividends with a large decrease in freeway congestion (24 percent) and no increases on collectors or arterials. In these dense areas, trips tend to be short and transit enhancements have some payoff. The effect of SG on enhancing transit ridership is marked overall (29 percent increase), but especially noticeable on bus and commuter rail.

GHG is essentially unaffected without AVs.

Travel Impacts with AVs. AVs add 1 percent to overall VMT in this subarea but on freeways they add 9 percent alone and 11 percent with toll lanes. Unlike in other subareas, VHT is marginally reduced overall (1 percent) but significantly for

freeways (10 percent for AVs alone and 7 percent for AVs with lanes).

VHD sees modest overall decreases of 1 percent but very significant freeway decreases occur both with and without added lanes—34 percent and 37 percent respectively. A small amount of freeway traffic occurs in the cores on freeway spurs so that these large percentage reductions really reflect small absolute numbers.

SG, despite increasing growth and VMT in the cores, produces significant reductions in overall VHT (17 percent), and an insignificant reduction in delay overall but a significant reduction in freeway delay (21 percent). By enhancing transit and moving people closer to their workplaces, the SG scenario shortens trips, lowering VMT and probably VHT.

AVs reduce transit ridership by about 16 percent overall but SG offsets this, adding 4 percent to ridership.

GHG increases moderately in the AV scenarios and slightly in the SG scenario.

D.5 Interstate 495 (see Fig. D.5)

Note that for the Interstate impacts we add an indicator for traffic volume and volume to capacity ratios (V/C ratios) and compare free lane to toll lane performance. Volume should not be confused with VMT (Vehicle Miles Traveled), which multiplies volumes by trip length and which we call traffic.

Travel Impacts without AVs. As might be expected, the added toll lanes create large changes on the Beltway in all indicators.

The added tolled lanes increase traffic volumes by a very significant 39 percent. Toll lanes carry 30 percent of the volume of free lanes. On a per lane basis, however, this ratio increases to 52 percent. VMT increases by 15 percent with toll lanes carrying 19 percent of the VMT of the free lanes. Beltway VHT decreases by 6 percent.

The biggest impact of the added lanes is realized in changes in delay. VHD goes down by a very significant 36

percent overall, with essentially no delay on the toll lanes. The V/C ratios that measure congestion show that the free lanes would operate at an average V/C ratio of 0.80 (LOS C) and the toll lanes at an average V/C ratio of 0.39 (LOS A).

With SG, volumes actually decline by 2 percent but VMT declines by 7 percent. VHT declines by 7 percent and VHD increases by 3 percent.

Travel Impacts with AVs. Introducing AVs without adding toll lanes increases traffic volumes (not VMT) by 21 percent. Adding the tolled lanes boosts this increase to 38 percent. The toll lanes carry 18 percent of the total volume of free lanes, which increases to 41 percent on a per lane basis.

VMT increases by 21 percent just by inserting AVs and by 30 percent when adding toll lanes, which carry only 10 percent of the VMT of the free lanes. Beltway VHT increases 8 percent

but drops to 4 percent with added toll lanes since they take pressure off the free lanes; lowering the value of time makes the toll price more acceptable.

VHD from AVs alone decreases by 10 percent, and when adding toll lanes, to a very significant 33 percent, though not quite the 36 percent without AVs reported above. This can be explained by the larger increase in volumes and VMT attracted by the capacity increases from AVs plus new lanes. Congestion, measured in V/C ratios, sees the free lanes operating at an average V/C ratio of 0.81 (LOS C) and the toll lanes at an average V/C ratio of 0.37 (LOS A).

SG with AVs produces some interesting results; while volumes and VHT increase by 5 and 7 percent respectively, VHT decreases by 4 percent and delay by a noteworthy 11 percent.

D.6 Interstate 270 (see Fig. D.6)

Note that for the Interstate impacts we add an indicator for traffic volume and volume to capacity ratios (V/C ratios) and compare free lane to toll lane performance. Volume should not be confused with VMT (Vehicle Miles Traveled), which multiplies volumes by trip length and which we call traffic.

Travel Impacts without AVs. Compared to the Beltway, I-270 toll lanes attract less new volume (adding 18 percent compared to 39 percent) and see lower VMT increases (adding 12 percent compared to 15 percent). Toll lanes carry 16 percent of this overall volume, increasing to 33 percent on a per lane basis. VMT increases by 12 percent.

VHT sees a marginal decline but VHD is very substantially reduced (29 percent). Congestion, measured in V/C ratios, shows the free lanes operating at an average ratio of 0.79 (LOS C) and the toll lanes at an average ratio of 0.36 (LOS A).

The SG story in this corridor shows modest declines in volumes, VMT, VHT and VHD.

Travel Impacts with AVs. Inserting AVs attracts more traffic volume (15 percent), which adding lanes increases to 21 percent; the toll lanes carry 10 percent of this volume and 11 percent of the VMT.

As on the Beltway, VHT increases modestly (7 percent) with AVs, which goes up to 8 percent with toll lanes, reflecting the increased volumes and VMT from the added lanes. Delay drops significantly (14 percent) from AVs alone and much more substantially (24 percent) when adding toll lanes. Congestion, measured in V/C ratios, sees the free lanes operating at an average ratio of 0.92 (LOS E), the lowest in this analysis, and the toll lanes at an average of 0.19 (LOS A).

Combining AVs with SG adds moderately to volumes (14 percent), VMT (12 percent), and VHT (10 percent) but reduces congestion by 10 percent.

Caveats

The modeling of transportation impacts is always a fraught enterprise. It is important, therefore, to be transparent about the limitations of our work. Despite the caveats noted below, however, we believe that our analysis and findings are valid and useful. They are quite consistent with the AV impacts found in similar studies, which tend to be less conservative than ours. If anything, then, we understate their impacts.

Travel Model Limitations

Our four-step travel demand model is the type most commonly used by metropolitan planning agencies. However, more sophisticated models called Activity Based Models (ABMs) are increasingly used by large agencies because they show more realistic and dynamic aspects of travel behavior (such as combined trips for different purposes called trip chaining). Furthermore, Dynamic Traffic Assignment (DTA) models that capture the time of day of travel on a second-by-second basis are also coming into wider use. Because the four-step model does not capture these nuances, the results from our model cannot be readily compared to results from ABMs or DTA models. We also do not attempt to model the potential long term effects of COVID, teleworking and e-commerce. Certainly the recent, large, COVID-related trip reductions suggest that in a post-COVID world, a 20% regional telework share is plausible. If so, with less AVs than assumed, this alone might modify how and when toll lanes are implemented.

AV Model Limitations

Given the high uncertainty around AV adoption and their impacts on travel, our study projects their potential impacts based on well-established assumptions in the research literature. Therefore, rather than treating AVs as a separate mode, we reflect their impacts by changing model inputs and parameters based on assumptions about freeway capacity, value of time, operating cost, etc. However, AVs may also encourage more travel by the elderly and very young or more discretionary trips, since capacity and time penalties are removed, which might offset some of the additional freeway capacity. We do not explore these important possibilities here as they remain speculative and hard to bracket. We do not address the possibility that households will reduce car ownership with the adoption of a fleet of on-demand AVs or Shared AVs (SAVs). Furthermore, we also don't address the potential of AVs outside the study area, and so assume that AVs don't affect the points at which vehicles enter or leave the study area.

Transit Ridership

MSTM produces overall transit ridership on bus, rail, and commuter rail but does not reflect changes in transit service and fares. As noted, our model somewhat underestimates transit ridership, especially for buses. Despite substantial investments in new or extended heavy rail lines, our transit ridership results did not show a significant increase. Though some research has shown that improved rail service will influence long-term land use by changing the locations of population and employment, the land use impacts of improved rail service were not considered. Nor did we adjust service characteristics such as frequencies to improve transit performance.

Toll Charges

The scenarios are based on a non-variable toll charge of 40 cents/mile. Because tolls are dynamically adjusted, they would, in reality, vary significantly during the day. Current toll rates on the Virginia Beltway can range from 20 cents/mile in the off-peak to up to \$2.00/mile in peak periods. We tested alternative toll charges in our modeling (e.g. from 20 to 90 cents/mile) and found that results are very sensitive to toll costs. Since our model cannot incorporate those dynamic changes, we used a moderate toll value of 40 cents/mile. Our analysis assumes the added toll lanes are complete by 2040.

The National Center for Smart Growth Research and Education is a non-partisan center for research and education on smart growth in Maryland, in metropolitan regions around the nation, and around the world. The Center's independent, objective, interdisciplinary research uses the diverse resources of the University of Maryland and a network of national experts to explore issues related to land use and the environment, transportation and public health, housing and community development, and international urban development.

The Center, with the support of the Town Creek Foundation, has developed PRESTO, a futures testing framework to inform Maryland's citizens, advocacy groups, and decision-makers about the major forces that will affect the region's development over the next 25 years. By examining these forces and combining them into scenarios, PRESTO provides a picture of their potential impact, individually and in combination.

For more information on the PRESTO project, data and the models: <https://www.umdsmartgrowth.org/projects/presto>

I object to both the outcome and the process of the Managed Lanes Study. All alternatives that did not include tolls we eliminated without sufficient study. The use of tolls, especially occupancy-based tolls, disadvantages poor commuters. This problem is rooted in a faulty needs statement that discarded out of hand a public-funded approach to the problem that would keep our roads free at point of use. My second objection to the toll lane scenario is that we have seen this option implemented on I-495 as Express Lanes and in the I-200 intercounty connector. Both were marketed as reducing traffic flow in the non-toll main lanes, neither one delivered on that promise. If you drive either of those roads during a heavy commute, you will see that they are never near capacity, while the main lanes remain at near stand still. All these toll lanes accomplish is to allow wealthy individuals to travel more quickly than those who cannot afford the daily tolls. There is no benefit to the majority of the road users. On top of this, the environmental impacts are unconscionable and 34 people should not lose their homes to give a privileged few a faster ride to work. There is now a note on the DEIS site that says they will take the aftermath of COVID-19 and many companies' presumed long term shift toward more telework into account. The right thing to do at this juncture is to scrap the Managed Lanes Study and start again in light of shifting commute needs and with a needs statements that does not privilege the wealthy.

Sincerely,
Merryl Azriel
Gaithersburg MD Resident and Routine I-270 Commuter

Nirmal Babar

Hello. I am a resident of the Wyngate neighborhood in Bethesda. My house backs up to 495 and that is already a dampener on the property values on my lane. Widening the beltway would directly impact not only my home value, but also my quality of life drastically since my husband and I spend a significant amount of time in our backyard growing vegetables, flowers and making sure we are doing what we can to support the bee population in the area. We are strongly opposed to this widening effort! It won't help anyone and only make things worse for the residents directly affected.

AFTER READING THE RECENT PROPOSAL, THE MONORAIL SYSTEM IS BY FAR THE MOST PRACTICAL SOLUTION. PLEASE CONSIDER THE POSSIBILITIES. THANK YOU.

Gloria BABASHAN

A MONORAIL SYSTEM IS THE WAY TO GO.

CAROLYN BAGIN

I am against the I-495 and I-270 project as it is now proposed. I want a no-build option.

The task force has not adequately considered viable, less disruptive, less costly options and has not considered how our neighborhoods will be affected and how the pandemic has changed work and transport issues. Fewer people will be using the highway. More will be working from home. The monorail from Frederick to Shady Grove is viable and not put on the table. The high costs of the toll road will disproportionately affect lower income people. So, there are so many reasons to stop this ill-considered project that will cost us all billions in the years to come.

Richard Bagin

Alternatives seem to be ignored; local government leaders say estimates do not include lots of local road, bridges and water management issues creating major unfundable budget requests and property demolition and movement. All at a time when budget woes will be getting worse.

Halt it now. Listen to your constituents; don't bulldoze your plans on us and our properties and way of life.

Thanks.

Rich Bagin

Subject: I-495 and I-270 Toll Lane Project

Dear Officials,

I am writing because I oppose the I-495 and I-270 toll lane project and I support a no-build option.

I live in a sixty year old beautiful neighborhood, Woodley Gardens, that will be significantly impacted by this project. Some of my neighborhood will be destroyed. The already incredible noise pollution in our neighborhood will be far worse.

I am against taxpayers having to pay "Lexus" fees to travel along our highways that our tax dollars have paid for and continue to pay for. It is disgusting to me what was done in Northern Virginia in regard to toll lanes. When we travel to see relatives in North Carolina, we will see fast moving "Lexus" lanes that most drivers cannot afford and we will see the overcrowded, backed up highways for the "commoners". It makes far more sense to make the roadway available to all and use reversible driving lanes to mitigate traffic. It is wrong to force taxpayers to pay for infrastructure that their taxes are supposed to pay for.

And, my third reason for strongly opposing this project is because, in this day and age of global warming, it is crazy to believe that we are not implementing a solution that will be good for future generations. Instead, we are building something that makes it so that more traffic will be on our roadways, encouraging people to live farther from work. There will never be enough acreage to support this!

We should, instead, use reversible lanes in the interim while we build a mass transit system that will be good for next generations, and the health of generations to come.

Subject: Don't widen I-270

To whom it may concern:

I oppose the I-495 and I-270 project. I support the no-build option. Even if the pandemic had not occurred, it was not a good solution. Now that the pandemic occurred and many corporations have a work-from-home workforce, there may be a future trend to less use of office space, which will mean fewer commuters and then the I-270 project will be a moot point.

Sincerely,
June Baldwin

I strongly oppose the I-495 and I-270 project. I support the no-build option. Thank you.

Stephen Baldwin

Our comments on the DEIS are attached. We urge that the "no build" option be chosen by the State of Maryland. Sincerely Stephen and Kate Baldwin

Comments on DEIS, Widening I-270 and I-495

We oppose the widening of the two highways as outlined in the DEIS and urge that the “no build” option be selected. Our opposition is based on both economic and environmental grounds.

Adverse impacts on the Environment:

- The project would require the taking of some private property and public lands for widening the footprints of the highways (including an historically significant African American cemetery). This would affect both specific homeowners and the general public who would lose access to green space. The tree canopy and vegetation which help reduce pollution and global warming would be reduced.
- Paving over previously open ground adds to the area of impervious surface, increasing runoff from storms, and adds polluted water to our streams and rivers.
- The construction process itself will add to air pollution via the operation of fossil-fueled machinery.
- The production of construction materials, e.g., concrete, requires extractive activities with their own pollution-generating impacts.
- Based on personal experience travelling the Virginia express lane system, the narrowing from six to four lanes at the end of the toll lanes causes significant backups across all lanes, leading to increased pollution and lengthened travel times. This effect would likely be present in the northbound lanes of I-270 also.

Adverse impacts on the Economy:

- Advocates have claimed that the project will not require additional taxpayer contributions. This seems unrealistic, based on the experiences of other major infrastructure projects, e.g. the Purple Line. The taxpaying public would be signing a blank check on their future incomes.
- The State proposes that a contractor build the project in return for receiving tolls far into the future. This arrangement is similar to the one Virginia established for its Express Lane project, but recently the Australian company holding the contract indicated it was seeking to sell its interest. What makes this completed project unattractive? Lower anticipated revenues?
- A key concept in economic analysis is the relationship between benefits and costs. The widening costs mostly would be incurred in the next few years, while the benefits are anticipated to accrue over the next half-century. The rate of interest or “discount rate” underlying the analysis can alter the net estimated impacts. To the extent interest rates rise from the current historically low levels, the present value of future benefits will be lowered, reducing any gains from widening.
- The Covid-19 pandemic has strained both public and private budgets and has had negative impacts on people’s lives and work patterns. To the extent that there is a permanent reduction in the need for work-related travel and regular commuting, traffic, air pollution

and congestion may be reduced, so that future social gains alleged from highway widening would also be less, while the present-day costs will be largely unaffected.

For all these reasons, we urge that the State of Maryland abandon the idea of toll lane widening on these important transportation corridors.

Thank you for considering our views. We would appreciate learning your reactions to our and others' comments.

Sincerely,

Stephen E. Baldwin

Subject: My opposition to the widening of I-495 and I-270

Hello,

As a long-time Silver Spring homeowner I am writing to express my strong opposition to the Maryland Department of Transportation's (MDOT) \$11 billion public-private partnership (P3) to widen I-495 and I-270 for privatized toll lanes. I oppose this project and support the "no-build option" for several reasons:

- Tolls have the greatest impact on low-income people. Having special lanes for people who can afford to pay contributes to widening inequality and is the wrong direction for public policy at a time of growing awareness of inequality.
- We don't need anything to encourage more cars on the road. Climate change is a dire threat to our existence and we need public policy to reduce it, not increase it.
- We need more and better public transportation. For example, high speed buses are an affordable and environmentally responsible option that use existing roads.
- We do not need another expensive, disruptive transportation fiasco that could potentially cost taxpayers millions of dollars like the Purple Line. I pass currently abandoned construction sites on Wayne Avenue almost daily. Although I support light rail, this particular route is unlikely to attract the amount of usage to justify it. It does, however, give developers new opportunities to make taxpayer-fueled massive profits on projects in downtown Silver Spring that will not benefit my community.
- New major roads will contribute to more storm runoff, with detrimental environmental impact.

We need sensible, affordable and environmentally responsible public transportation as this area continue to grow, NOT bigger freeways and highways.

Thank you,

Melissa Bannett

Lisa B. Choplin, DBIA
Director, I-495 & I-270 P3 Office
Maryland Department of Transportation State Highway Administration

Ms. Choplin:

My wife and I are very much opposed to the proposed expansion of the Beltway (I-495) adjacent to North College Park and the Greenbelt Metro Station.

We live across the street (Edgewood Road) from the Polish Club property that is threatened by the expansion. The Polish Club property and the property owned by the Maryland National Capital Park and Planning Commission (MNCPPC), east of the Polish Club property, contain wetlands, trees, and wildlife (including deer, foxes, raccoons, rabbits, squirrels, turtles, turkey vultures, hawks, migrating birds, and a wide variety of local birds). This is one of the few natural areas remaining in College Park. The Polish Club president had hoped these properties would be made into a dedicated "green space". Instead, the state wants to mow down the trees so it can park construction vehicles and materials there.

This project would radically change our neighborhood from being a green sanctuary to a construction zone. Instead of enjoying walks in the woods and the view of trees from our windows, we would see a construction site.

The expansion of I-495 here would also require tearing down the buffer wall -- that we lobbied for many years to get -- that serves as a barrier to keep vehicle exhaust and noise from the Beltway out of our neighborhood.

The loss of the buffer wall would mean that our neighborhood residents, young and old, will once again be subjected to the vehicle exhaust that causes asthma, COPD, and cancer. I am a cancer survivor. That makes this expansion project a threat to my health and possibly my life. There is a K-8 school and preschool just east of our house (adjacent to the MNCPPC property). Those children -- who are more vulnerable than adults -- will again be at increased risk for asthma and cancer.

The loss of the buffer wall would also mean that our neighborhood residents will once again be subjected to the sounds of vehicles on the Beltway 24 hours a day, 7 days a week. And we will be subjected to the sounds of construction vehicles and workers from early morning, when some would prefer to be sleeping.

We bought our house in 1996. We renovated our house to make it "clean" and "green" thereafter (including installation of costly solar electric and hot water systems). Others in the neighborhood have made significant costly improvements to their properties, too. As a result, property values in our neighborhood have risen in recent years. But all our investments will be wiped away by this project. When it comes time to sell our properties, we will pay for the Beltway expansion with our own money because our properties will be worth much less than they are now. Who would want to live here after the trees are gone and it becomes a construction zone? Who would want to live here when the homes front the Beltway?

This draft environmental impact statement (EIS) does not adequately reflect the adverse impacts the project would have on the wetlands, the trees, and the wildlife that live in the wooded area across from our home. This draft EIS does not adequately reflect the adverse impacts that the increase in vehicle exhaust deeper into our neighborhood would cause

on human health (e.g., asthma, COPD, and cancer). This draft EIS also does not adequately reflect the adverse impact that the project would have on our property values.

In order to see the natural area that will be destroyed by this project, paste this link in your browser, scroll down, click on the "street view" and, on the image to the right, pull the cursor to the left. Straight ahead at the end of 53rd Avenue, on the far side of Edgewood Road, to both the left and the right, are the beautiful woods that will be destroyed.

https://gcc01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.google.com%2Fsearch%3Fsource%3Dhp%26ei%3DOC_kXcnAGpK25gLMgZH4BQ%26q%3D%2B53rd%2BAvenue%252C%2BCollege%2BPark%252C%2BMD%26oq%3D%2B53rd%2BAvenue%26gs_l%3Dpsy-ab.1.0.38.2869.2869..4878...0.0..0.69.69.1.....0....2j1..gws-wiz.CHU1UD0ab18%23spf%3D1575235390339&data=02%7C01%7CMLS-NEPA-P3%40mdot.maryland.gov%7C5d202ce851b144b9311108d85e651e71%7Cb38cd27c57ca4597be2822df43dd47f1%7C0%7C1%7C637363135679485022&sdata=hKCN808t4yGP4ykEqn8InBkKymHtRlgM2mYwdBsPhnE%3D&reserved=0

Please do not let the expansion of I-495 adjacent to North College Park and the Greenbelt Metro Station destroy this beautiful wooded area. Please preserve this little sylvan paradise for the residents who live here and for the many creatures who live in it. And please do not let the expansion of I-495 result in demolition of the buffer wall that keeps vehicle exhaust and noise from I-495 out of these woods and out of our neighborhood. Please don't let them make these beautiful woods and our neighborhood into a construction zone and a staging area for construction vehicles.

If the Beltway absolutely has to be widened, MDOT should only take down the fewest trees necessary to widen it, and rebuild the buffer wall.

MDOT should park their vehicles and store their materials elsewhere, where they wouldn't have to adversely affect our environment. There must be more appropriate locations to store vehicles and materials.

Thank you for your consideration.

Tom Bannister
53rd Avenue
College Park, MD 20740

William Banta

This is to express my concern over proposed toll lane changes from I-295 onto Connecticut Avenue.

I object to this proposed project and to all other attempts to finance these changes because I think taxpayer money on transportation should be allocated entirely to public transportation, such as the Purple Line. These proposed I-295 plan would only deepen human footprint on the earth's carbon budget by encouraging more automobile use.

The Republican plans for the Purple Line have failed because greedy private companies gobbled up money that should have gone to the project instead of private pockets. It's a flop. Worse, this project would only pour more money into a device that would disproportionately benefit the rich and destroy valuable forests.

Never vote Republican. That goes for you, Governor Hogan, in spades.

████████████████████

Kristine Barbieri

Please do not let the expansion of I-495 adjacent to North College Park and the Greenbelt Metro Station destroy the buffer wall and wooded area that serve to keep vehicle exhaust and noise from I-495 out of the neighborhood. My friends have a beautiful forested view from their house and this would be destroyed. Also, noise and fumes from the road would degrade the environment in that neighborhood, making it unbearable for residents and lower the resale value of their homes. Thank you for your consideration.

Subject: Do not widen 270

Dear all,

I am not supporting widening of 270

Widening of 270 will **not reduce** congestion even for a short time. It will become a **moving parking lot** from the moment this project started, plus (immediately following) a rapid increase of businesses and population, even many years before reconstruction of the road will be finished.

Creating tolled lanes will help only the richest ones, but they, naturally, will care less about rest of us, they will get an easy pass.

Public transportation is the solution!

It will **reduce for all:** the traffic congestion, accidents, pollution, stress.

I am against rework of 270.

I am for public transportation.

Regards,

Yefim Bargman

Cc: aklase@marylandtaxes.gov; treasurer@treasurer.state.md.us
Subject: Draft Environmental Impact Statement for I-495/I-270 Tollway Expansion

To Whom It May Concern:

My name is Jeff Barham. My family and I live in the Indian Spring neighborhood of Silver Spring, which is bordered on its northern edge by the Beltway between Colesville Road and University Boulevard. Our home lies within a block of land that would be impacted by the proposed widening of 495.

I support the no build alternative.

I am concerned that the proposed expansion of the beltway has the potential to inflict significant harm on my community with negligible corresponding benefits.

The project will reduce the primary public park space used by my children, friends and neighbors for play and exercise. The widening of the beltway would encroach upon Indian Spring Local Park, my neighborhood's outdoor hub and the most easily walkable area appropriate for youth sports practices, adult pickup soccer games, throwing baseballs or frisbees, and flying kites. (Perversely, taking away such local space from Indian Spring residents will not only make the neighborhood a less attractive place to live, but it will force us into cars to find such space further from our homes.)

The project will worsen the noise and pollution that already impacts our neighborhood by bringing the highway even closer to our homes, potentially exacerbating the asthma that I and my children already experience. These issues will be even more acute for my neighbors whose homes sit directly across from the beltway's current retaining wall.

Given the recent collapse and in-fighting associated with the public-private partnership to build the Purple Line, I am skeptical that the state will come away from this venture without foisting significant new burdens on Maryland's taxpayers. Indeed, the already threatened increases to residents' water bills to help finance construction costs would seem to be a harbinger of more bad news to come on this front.

At a minimum, it would be appropriate for planners to pause and take stock of the current and future projected changes to traffic patterns driven by the COVID 19 pandemic before undertaking a lengthy infrastructure project conceived of when a far smaller percentage of our population was teleworking.

While I sympathize with the desire for lessening congestion on the beltway, I find it hard to believe that creating additional high-priced toll lanes (which will predictably remain financially inaccessible and unused by the vast majority of drivers) carries the potential to solve the problem.

Thank you for your consideration.

Subject: DEIS Document is inaccessible

I am very disappointed with the Maryland Department of Transportation in the way they are providing information to the public for the I-270 Managed Lanes Study Draft Environmental Impact Statement.

After downloading the PDF document of the study, here are my findings on regarding the document and not its contents:

1. The document fails to meet accessibility features that PDF documents are supposed to provide. Although it can support a reader function for low sighted people, most navigation features are missing.
2. The table of contents and the page numbering are useless in an electronic environment. Most PDF readers do not understand the Chapter-Page format if you do not mark the chapters. A sequential page numbering system would make it easier to navigate.
3. The table of contents is a static table without links. It is a basic function of most PDF creation applications to create a table of contents that could be used to navigate PDF documents. This document is missing this accessibility option.
4. Keyword usage is inconsistent throughout the document. While trying to search for specific terms, the inconsistent use of keywords makes it difficult for the electronic reader to search for specific areas of concern.

While analyzing the PDF document and the metadata, it is clear that some of the links were removed from the document or care was taken to ensure they were not included. As a former information security professional with experience analyzing PDF documents for forensic information, I can also see that links exist for figure captions and footnotes but not for other navigation purposes. It is either a willful attempt to make the document less than publicly accessible while meeting the minimal standards for public release or it is ignorance on making the document accessible. Either way, this should not be how the Maryland government should be fulfilling its public role.

Another concern is the manual accessibility required to download the document by chapters. Individually, the chapters can be scanned by PDF programs to create a table of contents. However, MDOT provides links to each chapter as a single download. Either I will have to employ a program that will download every link on a page or manually download each chapter. Again, this is either a willful move to make the document minimally accessible while meeting minimal standards for public release or it is ignorance with making the document accessible. Again, this should not be how the Maryland government should be fulfilling its public role.

According to the metadata in the file, the document was created using "Acrobat PDFMaker 20 for Word." This is software created by Adobe that has been provided by Microsoft to convert Word documents to PDF. It is capable software providing the document is authored with the appropriate controls. Microsoft Word is very capable of creating the controls without additional effort. By not providing the controls, and given prior personal history with MDOT, it appears that the agency likely does not care about public opinion and is doing what is minimally required.

The document is formatted for printing. It is obvious that electronic access was not considered. Software to view properly formatted PDF documents is widely available including a free viewer from Adobe, the creator of the Portable Document Format. The Maryland government should provide its work products in a form that is electronically friendlier to concerned constituents. Maryland should make these dead tree (paper) versions a relic of the past.

I have included my representatives from District 17 on this note. I would like my representative to discuss with MDOT how they will make these very long reports more accessible to the public. I would like my representatives to consider that if MDOT will not cooperate on making their work products more than minimally accessible then they should submit legislation requiring more accessibility for their documents.

Comments on the I-495 and I-270 Expansion Draft Environmental Impact Statement (DEIS)

November 9, 2020

To Whom it May Concern:

My name is Suzanne Barone and I am the owner and resident of a house on Bellevue Drive in Locust Hill Estates in Bethesda. The development is wedged between Rockville Pike, I-495, and Cedar Lane. Part of Bellevue Drive parallels the beltway. **I oppose widening and I support the No-Build Option.**

The impact to Bellevue Drive in Locust Hill Estates will be far greater than that outlined in the document. While no houses will be directly taken according to the existing proposal, several of the yards in the neighborhood will be, leaving the highway much closer to residences. The values of our homes and the quality of our lives will be adversely affected forever but especially during the multiple-year build where the disruption area is vast.

This neighborhood has a noise pollution and road dirt/dust issue which will be compounded, not helped by this project. The neighborhood can look forward to years of construction noise in addition to the existing noise from the I-495 traffic, Rockville Pike traffic, and the Metro Car signal as it enters the tunnel. This will be especially true for my residence if they build. This is currently the case when the roads are razed and repaved at night for short periods of time. The traffic and large equipment noise and the dust generated by this potential I-495 expansion project will be unbearable for months to years that it will take to complete with predictable delays and cost overruns as we have seen from other projects such as the purple line and Silver Spring metro station. While, recommended, it is not assured that a sound barrier would be replaced or added to those area currently without one. Although proposed, the final size and placement will depend on the engineering. While a sound barrier would help with noise abatement it would further decrease the value of the houses by putting a proposed 22-foot high wall much closer to several residences.

In addition to decreases in housing values, additional monetary impacts will be felt by the major changes to the utilities that must occur to expand the road. These costs must be paid by someone, presumably by the customers as rate increases.

While I understand that there is a need to look at costs and benefits, the benefits seem to be overstated in light of the Covid-19 pandemic and the unknown lasting effects on traffic in the region. The State readily admits that it does not know of a model to predict the lasting effects of such a decrease in commuting traffic. In light of such a statement, it seems inappropriate to push ahead and assume that all will return to “normal.”

Again, I support a no build option.

Thank you for the opportunity to comment.

Suzanne Barone

Julio Barrera-Oro

As a near life long resident of MD and current homeowner in MOCO, I understand the gridlock of I-270 and the beltway well. However, while I feel going from 2 to 3 lanes from Clarksburg to Frederick could be warranted, expanding the beltway with more lanes is not. The green spaces around the beltway provide a critical break from car noise and pollution as well as give vital, natural trails for residents to enjoy. Expanding the beltway would shrink them even further and to what end? The beltway is already 3-5 lanes and added lanes do not mean lower traffic long term. Otherwise, Los Angeles's 6-lane highways would not be the country's most congested. I strongly urge you consider all modern options such as a light rail between the existing division before pursuing the destructive, futile effort of more lanes on the beltway. Let's make MOCO's transportation one reflective of modern day possibilities, not the failed and environmentally damaging methods of the past.

Hi

I'm Linda Barrett and I have lived in Montgomery County for all my life - 62 years.

My address is [REDACTED] Hermleigh Road Silver Spring MD 20902. I live approximately 2 miles away from the Silver Spring corridor of the Beltway expansion.

I am a retired teacher in MCPS, having worked most recently at Eastern Middle School. The Eastern MS and Blair HS communities will be significantly impacted by these changes. The DEIS acknowledges that 1,500 properties will be negatively impacted, and up to 34 homes will have to be bulldozed completely (Table ES-2). The project will disproportionately impact local communities, particularly low income communities and communities of color. We talk about equity - but the fact is that the people most negatively impacted by these changes are the people least able to afford the toll lanes. They will be stuck with all of the impacts, such as

1. increased air & noise pollution ... Being a former Physical Education teacher, I'm concerned that a child's asthma will be worsened by increased vehicle emissions. DEIS acknowledges that the project will lead to increased particulate matter, carbon monoxide, ozone, nitrous dioxide, and greenhouse gas emissions in local communities (Section 4.8.3) yet it fails to adequately address and mitigate these concerns. I am also very concerned about a considerable increase in noise pollution in the community.

2. increased risk of flooding and water pollution ... As a Master Gardener, we are constantly trying to reduce water runoff by planting rainscapes, conservation gardens or other water management initiatives. This expansion of the beltway will

add 550 acres of new impervious surfaces & drastically increase stormwater runoff, pollution, and flash flood risks for local communities. In addition, moving water pipes for this project could cost up to \$2 billion dollars. This cost would be placed on taxpayers, not the private partner, potentially leading to a 277% increase in water and sewer rates over the next 40 years, according to the Washington Post.

3. loss of green spaces ... parks, schools, churches, recreation centers. Dozens of local parks- Greenbelt Park, the C&O Canal, Cabin John Regional Park, Indian Spring Terrace Local Park, Rock Creek Stream Valley Parks, and many, many more (Table 4-5)- will be negatively impacted. We will all lose precious greenspace to pavement and park features such as trails and basketball courts will be destroyed. People need to be active - walking to school or church ... walking/hiking/playing in park & recreation spaces.

I support the NO-BUILD option. I believe that we can improve the bus system, finish the purple line, construct more biker trails, more teleworking, and do more to encourage ride sharing. We've reduced cars on the road during the pandemic ... I think we can continue to reduce the number of cars on the road & ease the congestion on 495.

Please take another look at alternative means of reducing the congestion on all of our major roads in the DMV.

Thank you, Linda Barrett

Edward BARROWS

November 8, 2020

RE: I-495 and I-270 P3 Program DEIS

1. Thank you for the opportunity to comment on the DEIS. I am a professional biologist who has undertaken biological research in the Potomac Gorge. I have written a book entitled the Washington, D.C., Area Ecosystem which includes some information about the Gorge and references some of the research students and I have done in the Gorge.

2. Based on all relevant data I have seen (including the Washington Biologists' Field Club DEIS Comments and Testimony, November 2020), I support the NO BUILD OPTION. As the Washington Biologists' Field Club (WBFC) wrote to you, the DEIS is legally faulty and incomplete for many reasons. I am opposed to any disturbance of Plummers Island, Rock Run, and parkland of the Chesapeake & Ohio National Historical Park (CONHP). The Potomac Gorge which contains Plummers Island and adjacent Mainland is a world-class biodiversity hotspot with many rare habitats and organisms, including some endangered ones. Plummers Island is a priceless living museum and the site of many biological studies made over the last 120 years. It is a site of some long-term biological studies, e.g., a lichen study, highly important in this time of fast global change. Globally endangered River Bedrock Terrace Hardpan Forest occurs on the Island. Besides being a research site, the Island has been important to me as a place where I have been with family and friends. The Washington Biologists' Field Club DEIS Comments and Testimony provides a great amount of information about the Island, so I'm keeping my feedback short.

3. Maryland and Virginia should carefully study all appropriate alternatives to the current DEIS and hold public hearings on them before proceeding with any highway expansion.

Sincerely,

Edward M. Barrows, Ph.D.
Professor of Biology, Georgetown University
Washington Biologists' Field Club member

Barrows, E. M. 2020. The Washington, D.C., Area Ecosystem. ylocopa Press, Bethesda, MD.

Subject: What does Republican Governor Larry Hogan plan to do to save the USPS from Trump's demolition derby ?

What does Governor Larry Hogan plan to do to save the USPS ?

The Trump administration and his crony postmaster General are ripping the USPS to pieces as fast as possible. WE ALL KNOW WHY.

Maryland's Republican Gov. Hogan is chair of the National Governors Association. Does he support the Trump approach to destroying the USPS because Trump can lose the election by mail in votes during the Covid 19 virus?

Does Governor Hogan have the intestinal fortitude to stand up to this viscous scheme or will he sit idly by doing nothing and allow Trump this extraordinarily flagrant egregious misdeed?

Article 1, Section 8 of the U.S. Constitution in 1789 authorized Congress to establish the Post Office. It does not authorize Trump and his crony mobster pal to destroy it.

Governor Hogan take action now or resign.

What is needed is more public rail transit and not more congested roads. Every "improvement" in the highway system has led to more traffic, congestion and pollution including more traffic accidents. The administration only knows roads and cares little about rail. Trying to use the CSX RR for more rail is futile. At one time there was multi-modal. In truth that meant small, medium, large and huge rubber tired infernal combustion vehicles. But, you will continue to pursue road nonsense no matter how bad it will make future travel. That's what you get paid to do - not make travel better in Maryland. Its simple but there is no administration care or comprehension to consider more rail.

I know the Purple Line is in trouble but that is not due to the mode. It is due to mismanagement.

Program Updates Summer 2020

Greetings,

In an ongoing effort to keep you informed of the latest and most accurate information about the I-495 & I-270 Public-Private Partnership (P3) Program, I am pleased to share with you the [Summer 2020 Newsletter](#).

The I-495 & I-270 Managed Lanes Study has entered an important phase for public input. We encourage your involvement in this process by reviewing the [Draft Environmental Impact Study \(DEIS\)](#) and by participation in one of the [virtual or in-person public hearings](#). Further details are included in the attached newsletter.

We understand how COVID-19 is impacting all Marylanders today – in how we work, in how we spend our free time, and in how we travel. While MDOT's number one priority is the health and safety of Marylanders, we continue with our efforts to ensure transportation improvements are being developed to meet our State's needs not only for today but for the next 20-plus years. We will

continue to work collaboratively with all our stakeholders in the development of the I-495 & I-270 P3 Program.

We will continue to keep you updated on P3 developments and welcome your feedback. Please visit 495-270-P3.com for the latest information.

Sincerely,

Lisa B. Choplin, DBIA
Director, I-495 & I-270 P3 Office

Subject: Re: FHWA and MDOT SHA releases I-495 & I-270 Managed Lanes Study Draft Environmental Impact Statement (DEIS) and Draft Section 4(f) Evaluation

The I-270 corridor desperately needs a rail solution. Also, the Purple Line stalemate MUST be overcome to properly finish the LRT. A long term I-270 corridor rail plan has never been studied. With the super abundant traffic and congestion it is obvious other transportation solutions are needed and not more traffic lanes. MARC trains are insufficient and the route very roundabout with only part time weekday service. It is criminally negligent and unprofessional to avoid having all day frequent electric rail service between Montgomery County and Frederick or Hagerstown. There is more than enough justification for it. Stop being an ostrich burying your head in pavement. Rail can be achieved economically and quickly. Ask any European transit system.

Subject: FHWA and MDOT SHA releases I-495 & I-270 Managed Lanes Study Draft Environmental Impact Statement (DEIS) and Draft Section 4(f) Evaluation

Greetings.

The Federal Highway Administration (FHWA) and the Maryland Department of Transportation State Highway Administration (MDOT SHA) have completed the Draft Environmental Impact Statement (DEIS) and Draft Section 4(f) Evaluation for the Managed Lanes Study, with the Notice of Availability published in the Federal Register on July 10, 2020. The DEIS includes traffic, environmental, engineering and financial analyses of the Build Alternatives and the No Build Alternative. This DEIS provides an opportunity for the public, interest groups and other agencies to review and provide comment on the proposed federal action and the adverse and beneficial environmental impacts and proposed mitigation for unavoidable impacts.

FHWA, MDOT SHA, and the Maryland Department of the Environment (MDE) will conduct six Joint Public Hearings. The U.S. Army Corps of Engineers (USACE) will participate in one hearing on August 25 to meet the Department of the Army requirements. Comments will also be accepted on the Joint Federal/State Application (JPA) for the Alteration of Any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland. USACE is responsible for reviewing the JPA per the Clean Water Act, Section 404(b)(1) and MDE is responsible for reviewing the Application per Environment Article §5-503 and §5-906, Annotated Code of Maryland.

Subject: Who is the rail transit poster George Barsky ?

I have a long list of political and government people in Maryland who I occasionally send my opinions to about public rail transit. I have been doing that for many years and have hopefully and thoughtfully provided much information about light rail tram systems to them. My opinions are based on real life experiences and an interest in the topic that goes far beyond the casual.

I grew up in New York City when there were still many streetcar lines in four of the five boroughs [by that time Staten Island no longer had any streetcars]. I relocated to Maryland in 1965 and have lived, worked and commuted throughout the region. I have extensively used MARC on the Penn and Brunswick lines, as well as all Metrorail lines. Long ago I also traveled on the D.C. and Baltimore streetcar lines. Of course, even the Hagerstown and Frederick 80 mile trolley system once existed and so did the Washington and Old Dominion electric Interurban line in northern Virginia and let's not forget the Washington, Baltimore and Annapolis high speed electric interurban line. Now, all are history.

Most American cities and towns had streetcar systems and many had long distance interurban [high speed trolleys] lines connecting them. I have been fortunate to have been able to experience first hand many streetcar or trams systems here in the USA, in Europe and Asia. For example places like New York, Boston, Philadelphia, Baltimore, Washington DC, Pittsburgh, Chicago, Minneapolis, Los Angeles, etc. had very expansive networks. Except for a few remnants most are history. A few new lines now called light rail transit [LRT] have been built starting in the 1980's with San Diego.

Given the mega car culture, ignorance and disinterest of electric tramways in this country by the larger population and almost all politicians, attempts to economically build tramways has been lost. The real experts have passed on along with the domestic industrial base. The so-called contemporary expert consultants also lack the knowledgeable expertise that thrives in Europe and Asia which actually achieves great success in building new electric surface tram lines and maintaining and enhancing their huge number of historical systems crushed by war. On the other hand the USA merely ripped out its infrastructure and decided dirty fuelish buses are better.

Unfortunately the Purple Line demonstrates the severe inability of this country, and particularly this state to adequately understand the need for simple solutions to create a viable economic electric surface rail transit line. I would hope readers could understand there are better ways and more economical ways to create electric transit here. All they have to do is examine places like France or most anywhere in Europe. The monumental over engineering in places like Silver Spring and Bethesda is, in my view, utterly needless. I am quite familiar with both both locations and the entire Purple Line route.

Yes, there are many other big problems to deal with today but pubic transit is a very long term need and has many significant ramifications. More roads and highways have not produced the wonderful outcomes suggested by the road building community and the road champion governmental agencies. But they are blinded and hindered by their own preoccupation and survival.

FYI - I have a BS in Math, and Masters in government along with post graduate work. I have worked for both large and small companies, owned my own business and also employed by the U.S. government, now retired. I know the difference between a GG-1 and a T3.

Subject: An I-270 Monorail - NO WAY - Here's why

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fichef.bbci.co.uk%2Fnews%2F800%2Fcpsprodpb%2F2A15%2Fproduction%2F_108837701_gettyimages-167076270.jpg&data=04%7C01%7CMLS-NEPA-P3%40mdot.maryland.gov%7Cf612c55deba4e2820ea08d87dc10c47%7Cb38cd27c57ca4597be2822df43dd47f1%7C0%7C0%7C637397615380771423%7CUnknown%7CTWFpbGZsb3d8eyJWljojMC4wLjAwMDAiLCJQIjoiV2luMzliLCJBTiI6IkhhaWwiLCJXVCi6Mn0%3D%7C1000&data=xQUYeAA0Rg95ZWJwO5ltoLNqMN7JkYmFzaGn19MGMfw%3D&reserved=0>

A monorail sounds like a futuristic solution to transport people. However, compared to conventional ground based rail systems there are several distinct and detrimental problems surrounding the mode.

Monorails can be essentially two types: straddling or hanging. The vast majority of those existing monorail systems are straddling. And many of those systems are in amusement parks. Monorails that are actually used as public transit are very few compared to conventional ground based rail.

Monorails need 100% large structural support systems such as those used by highways and elevated conventional rail. A monorail can be built near the ground or even in a subway but still needs its structural support wherever it goes. Generally, monorails are highly elevated to clear vehicular traffic or other things below it. In that respect it requires massively elevated and expensive complex stations.

The straddling monorail operates on top of a massive beam whether concrete or steel. It is not a simple very narrow single rail. It is big and heavy and requires a massive support system. The monorail car or train has side panels which hang along the sides of the beam which are used for stability, guidance and power.

The need to switch from one beam to another whether for reversing direction or changing to another route requires massive expensive beam switches completely different from conventional simple rail switching. Its like moving the entire beam from one direction to another.

In the event of a breakdown, mechanical or electrical failure or even a fire there is no way for the passengers to evacuate quickly and safely and usually requires some ladder or bucket method such as used with fire trucks or utility trucks.

Also, most monorails are built with proprietary designs for the structural track, power and rolling stock. Thus, there is very little interchangeability as is possible with conventional standardized rail systems. Normally the monorail rolling stock cannot be coupled into longer trains as is easily done with conventional rail rolling stock. Thus, the proprietary design leaves little room for competitive replacements or expansion. The monorail train length is also restricted by the station platform lengths.

These are a few of the factors and concerns about constructing monorails. They are generally less speedy than conventional ground based rail. There is really no advantage and many disadvantages to the seemingly transit of the future. Nice for amusement parks and futureland but not good as public transit.

Subject: A Lesson From Oslo, Norway

Oslo Norway Knows How

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fyoutu.be%2FSMsqo0pP1E4%3Ft%3D0&data=04%7C01%7CMLS-NEPA-P3%40mdot.maryland.gov%7C6f74c100054e4ff8112a08d88416b8e2%7Cb38cd27c57ca4597be2822df43dd47f1%7C0%7C0%7C637404580414351677%7CUnknown%7CTWFpbGZsb3d8eyJWljiMC4wLjAwMDAiLCJQIjoiV2luMzliLCJBTiI6Ikk1haWwiLCJXVCi6Mn0%3D%7C1000&odata=JxIWjR5XZikFFNmZErcDEScjj5sbfGRk9h%2BsOnqhts8%3D&reserved=0>>
>

Here is a video of a ride on a tram [light rail] line in Oslo, Norway. Its a good way to go sight seeing for visitors. It just seemed to me that the amount of space needed for the right of way [ROW] is quite minimal compared to new roads, highways and traffic lanes. It also is high capacity and virtually without any pollution. Its also smooth and comfortable. In other words, a very good ride. Additionally, Oslo also has a Metro Rail Rapid Transit system. The Oslo population is approximately 700,000.

I also noticed the stations in the countryside are very sensible and require minimal space and cost. I also noticed when traveling through the urban core the streets are quite narrow but roomy enough for trams and other traffic. There are numerous junctions with other tram routes that operate throughout the city, in other words a system of convenient public rail transport. But the number of buses can be counted on just 2 fingers while the number of trams goes beyond both hands.

Lastly, the safe high speed of the trams is interesting. Whether in the countryside or on city streets travel time is minimized. Thus, it strikes me a system like this would be fabulous for suburban Maryland such as in Montgomery and Prince Georges Counties, especially in the I-270 corridor region. Just imagine not having to drive on those absolutely awful congested [in "normal" times] roads.

But, and there is always a but, trams might be fine for other places BUT in Montgomery County there is ZERO VISION for such a system. Even IF the Purple Line is actually completed [heaven only knows if and when and how] it is only a single tram line being built in a needless hyper expensive way leaving a very bad taste in the public wallet. And its only half each of a single line in Montgomery and Prince Georges Counties, not a system.

So, we should applaud Oslo and the many other cities like it world wide while looking at the pitiful, painful lack of interest and the NO HOW, NO WAY example set by the Maryland politicians. When will the state appoint a transportation secretary who came from the rail sector? When will they ever learn??

George Barsky

Subject: Just one more view of Oslo, Norway by tram [light rail]

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fyoutu.be%2FzdyMUuOGQ6c%3Ft%3D0&data=04%7C01%7CMLS-NEPA-P3%40mdot.maryland.gov%7C9c8b86aff59f4accbcc708d884bb8725%7Cb38cd27c57ca4597be2822df43dd47f1%7C0%7C0%7C637405288245930474%7CUnknown%7CTWFpbGZsb3d8eyJWljoimC4wLjAwMDAiLCJQIjoiV2luMzliLCJBTiI6Ikk1haWwiLCJXVCi6Mn0%3D%7C1000&odata=xqm%2F4dbY40neEWzyBDo2AylcP82CK7SyxsSwXb2%2Bfmg%3D&reserved=0>

Just one more view of Oslo by tram.

It is interesting this tram [LRT] line starts in combination with the Oslo Metro [rapid transit] system. Both the tram and the Metro use the same tracks. The tram line then switches off onto its own private right of way [PRW], i.e., no street running. When it enters operations in the street it is in an upscale neighborhood. Eventually it runs through the urban core with numerous junctions with other tram routes. Along this line we also see many buses being used in Oslo. Much of the urban core has narrow streets.

It seems to me the city is highly populated with a young generation - maybe the so-called X generation. In any event they use the fine public transportation in Oslo.

Thus, another lesson and opportunity to be learned by Maryland and the suburban counties. However, based on experience and history here it is not likely this lesson will be learned. It is even less likely that politicians and planners here will make it their business to visit and learn from cities worldwide like Oslo and then implement the lesson. Here they are all stuck in the quagmire of pavement, congestion and pollution. Too bad they have already and will continue to earn a grade F in public transportation.

Voting matters.

Subject: What does Lyon, France have that Montgomery County doesn't ?

Take a ride on Lyon's LRT line 4. Lyon population in 2019 1,705,000.

<https://gcc01.safelinks.protection.outlook.com/?url=https%3A%2F%2Fyoutu.be%2F6xaPl1lj4CA%3Ft%3D0&data=02%7C01%7C495-270-p3%40mdot.maryland.gov%7C7f5705570e9942056e3608d83b34aaca%7Cb38cd27c57ca4597be2822df43dd47f1%7C0%7C0%7C637324444680112702&odata=tcu85tuKuq6e2PdNodKhoV%2FH1XdQbFAIWJ8iaWPAFsQ%3D&reserved=0>

Lyon now has 6 LRT lines with the last finished in 2019, the first in 2001. The system uses Alstom 100% low floor LRVs. All the rail is girder rail - a one piece economical grooved rail historically the better rail used by the vast majority of LRT and street railways. The overhead wire is the simple single trolley wire. Many preexisting trees and shrubs were not cut down along the line. The stations are simple curb height platforms with a weather shelter. Most of the line has grass tracks and simple tracks in concrete where necessary. The line is designed with a right of way absent of motor vehicles. There is no major infrastructure such as expensive elevated or tunnel construction and no crash walls are never needed anywhere.

The line is well patronized with a reasonable schedule frequency. It connects with the other new 5 LRT lines in Lyon. It appears to be efficient, effective, well patronized and did not cost excessive amounts of money or take many years to plan and construct. Apparently the French KNOW HOW to design, finance, build, operate and maintain their LRT systems - unlike the American Maryland Purple Line designed with monstrous over engineering and being built, if it is ever finished, by neophyte inexperienced LRT organizations - simply put they are the NO HOW group. A horribly expensive pathetic wasteful collaboration.

The French and other Europeans have a great LRT legacy while Maryland has none. Yes, there is the one line only Baltimore LRT - not a region wide system at all.

Lyon also has a multi line automated metro system, a high speed LRT to the airport called the Rhone Express, a funicular that climbs very steep hills, the SNCF French National Railway and even a river boat shuttle. Montgomery County has none of these, no major airport, no river, no funicular, and only the one U shaped Metrorail Red line, and a very part time MARC train commuter service but nearly 100 Ride-On bus lines. And it still struggles to build the one Purple Line.

One can easily determine which place has the better balanced transportation network without needing immense sprawling congested roads and highways. Maybe the French people know something that Maryland and Montgomery County can't figure out?

George Barsky

PS: How many fingers are needed to count the number of transit buses seen in Lyon?

Subject: [Non-DoD Source] I-495 and I-270 Managed Lanes Study Draft Environmental Impact Statement
<Blockedhttps://youtu.be/O-FFigtDN6E?t=5>

It is my understanding the DEIS is about 18,000 pages. I have not read it.

My view is take no action with regard to increasing the highway system.

If anything we need a modern electric rail system such as the one above in Utrecht, NL. Since the photographing of the line it now has 100% low floor light rail cars that can be coupled into trains.

The station platforms have also been converted to low level.

You will note the speed and simplicity of the system along with its capacity.

Evidently the day photographed must have been a Sunday or holiday.

These light rail systems do not have to cost at the level of the Purple Line.

Experienced light rail professionals can make this work far better than additional lanes or more automotive traffic. This would be good between Montgomery County, Frederick and even Hagerstown. Who in their right mind wants to drive long distances in hellish I-270 traffic when they could ride comfortably and safely on smooth rail.

Only the Governor and his highway clansmen want more roads at a very steep price with added congestion and pollution and traffic madness.

<Blockedhttps://www.iamexpat.nl/sites/default/files/styles/article--full/public/uthoflijn-utrecht.jpg?itok=YKThE5Wq>

How can they do this in Utrecht while Montgomery County is paralyzed with traffic?

White Plains, Maryland 20695

"Working with elected, civic and business leaders to build great communities"

CHASING ‘FREE MONEY’: THE FATALLY-FLAWED SCHEME TO OUTSOURCE MD’S INTERSTATE HIGHWAYS TO TOLL-ROAD PROFITEERS

BY GARY V. HODGE

A 495-270-295 “traffic relief” plan was announced on September 21, 2017 by Governor Larry Hogan and Pete Rahn, his former Secretary of Transportation. Their plan was to privatize and widen I-270, the Capital Beltway and MD295, the Baltimore-Washington Memorial Parkway, with two new express toll lanes in each direction. As proposed, the State would enter into a public-private partnership, or P3, with a lead project developer and outsource the responsibility for designing, building, financing, operating and maintaining the managed lanes at no cost to the State, in return for granting them the right to collect toll revenue on the highways for the next 50 years. The State has not persuaded the federal government, or Maryland’s members of Congress, to agree to transfer ownership of the B-W Parkway to the State, so it’s no longer in the plan.

For the past month the State has been taking testimony from elected officials, government agencies, regional planners, community groups, advocacy organizations and private citizens at public hearings on the 19,600-page Draft Environmental Impact Statement (DEIS) on the I-495 and I-270 Managed Lanes Study. The Draft EIS, a requirement of the National Environmental Policy Act (NEPA), is the current step in the march of the Governor’s plan toward implementation.

If the goal was to maximize public participation, the timing of the hearings couldn’t have been worse, in the middle of a pandemic, an economic crisis, massive unemployment, a superheated Presidential campaign, and unprecedented weather events. During the second and final in-person hearing on September 10 in Rockville, the day I testified, the area was paralyzed by a torrential rainstorm and flash flooding.

I had given testimony on this project before, more than a year ago at the Maryland Board of Public Works meeting in Annapolis on June 5, 2019. I said there were three questions that needed to be answered before the State decided to move forward with the project:

First, “Will it work?”

Second, “Is it worth the risk?”

And third, “Is it the best we can do?”

The Governor said these were “good questions.” Back then the answer to all three questions was “no.” Today the answer is still “no.” It won’t work, It’s not worth the risk. And it’s not the best we can do. The nearly 20,000 pages of the Draft EIS hasn’t changed that—only confirmed it.

This project will result in more traffic congestion, not less, defeating its “purpose and need.” And in spite of initial assurances, the P3 will need to be subsidized by Maryland taxpayers after all. Even if one accepts the optimistic cost estimate of \$9.6 billion, the few minutes saved in commute times are hardly worth the price of the ordeal that lies ahead: Years of delays, detours and traffic snarls; constructing new entrance and exit ramps, interchanges, and bridges; and new traffic patterns, followed by high tolls to use the express lanes.

How much longer will the thousands of Marylanders who live in the shadow of this project be dangling on tenterhooks waiting for the sword of Damocles to fall on them, their homes, their neighborhoods, their security, and their daily lives?

The one indisputable fact is that chronic traffic congestion will need to continue indefinitely in the “free” lanes or there’s no incentive for motorists to pay to use the toll lanes. That’s the business model. To make this scheme work, the State’s private sector partner in the P3 will need to harvest vast amounts of toll revenue, make a profit, and pay big dividends to their investors. And in these uncertain times they’ll expect the State to minimize their risk with a safety net made of titanium.

Before embarking on a project this massive and costly, touted as “the largest P3 traffic relief project in the world,” the right sequence of steps would be to correctly diagnose the problem; prescribe the best possible solution after considering all the alternatives; and then find the means to pay for it, minimizing risks to the State and Maryland’s taxpayers. The State should have engaged in a deliberate, thoughtful, collaborative and comprehensive search for solutions. Instead, it took a “ready, fire, aim” approach. Private capital investors decided what kind of solution they were willing to invest in, and the State complied, instead of taking the measures more likely to deliver the results that are needed.

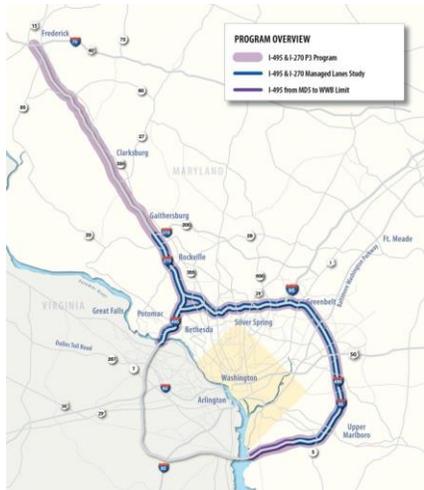

Politicians in the United States and around the world are proving to be no match for international toll highway privateers like Australia’s Transurban, the leading contender

for the Maryland 495-270 P3. There's good reason to worry that in contract negotiations their team will run circles around State lawyers.

The federal government is failing in its historic responsibility to invest in the nation's infrastructure. To fill the funding gap, state leaders are chasing "free money." Maryland isn't the only state being seduced by the siren song of P3's. But Maryland is one state with a sterling reputation for sound fiscal management, with a AAA bond rating, and the ability to borrow money at the lowest interest rate in history. Unfortunately, in the aftermath of P3 deals, when the politicians who made them are gone, taxpayer bailouts have become commonplace. The truth is, there's no such thing as "free money." One way or another, sooner or later, Marylanders will pay—in tolls or in taxes—or both tolls and taxes.

It's been said that this project doesn't need legislative approval or support. Now that it's been acknowledged that State funding will be needed, it probably will. For almost three years a fire bell in the night has been ringing in the General Assembly's ears about the wisdom of this scheme. Legislation has been introduced, heard by the committees, and debated. A few bills have even been passed by the House of Delegates. But in spite of the valiant efforts of a few Delegates and Senators, the legislature as a whole has been indifferent, and has done nothing to assert its oversight authority, demand transparency and accountability, and take concrete action to slow or stop this juggernaut. Next January, legislators will have one more opportunity. Hopefully, for the sake of their constituents' wellbeing and their own election prospects in 2022, they won't leave Annapolis empty-handed a fourth year in a row.

On January 8, the three-member Board of Public Works, the State's most powerful decision-making body that most Marylanders have never heard of, decided in a 2-1 vote to greenlight the first phase of the project, with Governor Hogan and Comptroller Peter Franchot voting yes and Treasurer Nancy Kopp voting no. The BPW reduced the footprint of the first phase of the project to cover I-495 from the vicinity of the George Washington Memorial Parkway to the I-270 west spur, across and including replacement of the American Legion Bridge, and continuing on the I-270 west spur to I-370. Future phases of the project would eventually continue north on I-270 to I-70, and around the Beltway to the Woodrow Wilson Bridge.

The list of the project’s fatal flaws and risks is long and still growing. Here are some of the most serious and critical concerns that have been expressed:

- It fails to address the original “purpose and need”: To relieve traffic congestion
- It doesn’t deliver significant savings in reduced travel times, only a few minutes at most
- Congestion will continue on the “free” lanes
- Tolls to use the express lanes will be costly during peak rush hours
- The viability of the project is questionable without public funding, which contradicts original assurances
- It shifts financial risk from the private sector to the State, with taxpayer subsidies that could count against the State’s debt limit
- It would reduce the State’s fiscal capacity for investment in rail transit and other multi-modal infrastructure
- Future toll revenues are unknown
- Construction costs are incomplete and likely to exceed estimates
- Moving WSSC water and sewer infrastructure in the project’s path would cost an additional \$1-2 billion
- There will be loss of protected parklands, and impact on 1,500 properties
- “Limits of disturbance” will need to be expanded
- There will be a significant increase in stormwater runoff to rivers and streams
- There is no standalone transit option; Public transit alternatives were eliminated from consideration
- Details of the “Capital Beltway Accord” between the Governors of Maryland and Virginia are unknown; No written agreement has been made public
- There is no provision for accommodating rail transportation on the new American Legion Bridge

- Rush-hour traffic north on I-270 would be worse, not better; Travel times to Frederick for all alternatives would be worse
- Upper I-270 is included in Phase 1 of the 495-270 P3 project, but is excluded from this Draft Environmental Impact Statement
- The toll lanes will impact local road networks, where there may be no excess capacity or potential for expansion, leaving fixes up to local governments
- Increasing highway capacity on I-495, I-270, and connected arterial roads, will increase long-term traffic demand
- A State plan that maximizes driving and perpetuates automobile-dependence for the next half-century fails to respond to the climate change crisis

In the history of bad ideas, this scheme is still just a footnote that would be quickly forgotten. My advice would be, don't make it a whole chapter, with potentially dire and long-lasting consequences for decades to come. Take a cold, hard look at the critical mass of facts, including the State's own analysis, disenthral yourselves, and let go.

This new round of hearings on the Draft EIS is merely "bouncing the rubble," to borrow a phrase from Churchill. The only thing preventing this dubious scheme from collapsing is the wreckage and debris of unconvincing justifications piled up around it. Not even the 20,000 pages and million words of the DEIS can save it. After almost three years, the fatal flaws and risks of this project have already been dissected. The *post mortem* has already been written.

This isn't the best we can do. Pouring rivers of concrete to create a magic carpet for rich people is not what we ought to be doing to put Maryland in the vanguard of America's most competitive states. A massive \$9-11 billion investment in new highway construction is not the path to Maryland's future. It would only perpetuate the unfair and inequitable gap between "haves and have nots" that we should be working to close. What we need now is a multi-modal strategy that will meet the mobility needs of all our people.

We need to put the financing of Maryland's transportation program on a solid and sustainable foundation, in spite of the federal government's failure to play its historically important role. Privatizing our interstate highways and outsourcing our State transportation program to international toll highway profiteers is not the answer. We don't ever want our Secretary of Transportation flying to Australia to get his marching orders, or to find out what projects he can put in the State's new six-year capital program.

Many steps remain before the NEPA process is completed and the project moves toward implementation: Responding to comments on the DEIS, getting federal concurrence on the Final EIS (possibly during a Presidential transition), writing the

Record of Decision. Assuming the normal slippage in the schedule of a project of this size and complexity, it's not hard to imagine that the procurement process, selecting the contractor, negotiating the P3 deal to build, operate and maintain the toll lanes, setting limits on future tolls, the required legislative review and Board of Public Works approval, will leave many critical decisions looming in the run-up to Maryland's 2022 election.

The cornerstone of the first phase of the 495-270 project is the American Legion Bridge, a huge and expensive undertaking by itself. A written bi-state agreement between Maryland and Virginia covering the details of the plan to replace the Bridge is crucial. If the "Capital Beltway Accord" is more than a handshake, and a written agreement exists, its contents have not been made public.

If this project is allowed to advance, the implementation and construction phase will land squarely on the desk of the next Governor. It would be unfortunate if the unintended consequences, collateral damage and financial risks of this misguided venture were to hang like an albatross around the neck of the State's next chief executive, diverting attention and resources from more vitally important priorities.

Investments in transportation infrastructure are some of the most consequential the State makes, with far reaching impact on our future economy, growth and development. After a promising start a half-century ago with the construction of the Washington metrorail system, Maryland has become more automobile-dependent than ever. The full potential of MARC commuter rail, and the promise of the Purple Line and Southern Maryland Rapid Transit project has not yet been realized. A successful mobility strategy for the 21st century will require new investment in seamless rapid rail transit network connecting communities and jobs that's fast, safe, and accessible.

Let's clear the decks for action and build the modern transportation system our people need and deserve, not make highway-building the default setting for our capital infrastructure investments. Let's restore Maryland's tradition of collaboration and consultation between the State, the counties, and affected local governments, as mutually respected partners.

If the 495-270 P3 project moves forward, in years to come we won't find any consolation in knowing that we were right to oppose it, when we consider how much progress we could have made working together on a bold new vision for Maryland's future.

GARY V. HODGE

The writer is president of Regional Policy Advisors, Vice Chair of the Maryland Transit Opportunities Coalition and a former Charles County Commissioner, executive director and chairman of the Tri-County Council for Southern Maryland. He has been engaged in State and regional transportation projects, programs and advocacy for 50 years, as a planner, an appointed and elected public official, consultant, and citizen activist.

This is his third in a series of essays published in Maryland Matters on the proposed 495-270 P3 plan announced by Governor Hogan and former Transportation Secretary Pete Rahn on September 21, 2017.

His previous two essays were “Pete Rahn’s Return to ‘Hip Pocket’ Government,” April 23, 2018; and “‘Largest P3 Traffic Relief Project in the World’ Needs More Scrutiny, Not Less,” March 8, 2019

Jeannette Bartelt

Dear MDOT, Do Not Approve the highway expansion proposed by Gov. Hogan. It's environmentally unsound. It makes much more sense to put in more rail systems and maybe even a Monorail

Nathan Barthel

Dear Maryland Dept of Transportation,

I am writing to comment on the proposed widening of I-495/270. As a resident of a neighborhood that borders 495 one might assume that I would be automatically opposed to the expansion. I am actually not opposed but would like to raise a few concerns in the way the project may impact me and my neighbors, wider environmental concerns, and longer term trends that are likely to impact road use.

First, the construction period for this road is likely to take years and I'm concerned about the disruption during that period. Like building an addition on a house, while the end goal may be desirable, the building period is painful. What will be done to mitigate noise, light and other related construction related issues during the building phase?

Second, I know that some trees will be removed, I'd like the project consider planting replacement trees even if they aren't in the immediate project area. Perhaps trivial in terms of the big picture, we don't need to, collectively, lose more trees.

Lastly, and perhaps most important is the long term use of the road. Today it may seem that autonomous vehicles are still a fantasy but sooner, rather than later, they will become a reality and even common - practically on our major highways.

While I don't know how roads should be best used with the onset of autonomous vehicles the chosen partnership must be flexible enough to revisit how lanes, managed lanes or otherwise, are used. We cannot be stuck in a public-private partnership that does not take into account the revolution of transportation in the US. Any agreement should be written in a way to allow for adoption of new technologies.

Thank you.

-Nate

Nathan Barthel

I just want to comment on the traffic models used to determine traffic under the various options. The entire project hinges on these models and yet there is little explanation, in laymans terms, how those models were developed, run and any associated assumptions. The public simply is expected to trust that what the models show is indeed reality.

I reached out to the individuals who developed the model 2.3.70 and my understanding is that p3 while it used the model did not rely on the organization that developed the model. Again, there is a degree of uncertainty into how those models were implemented and associated assumptions that are simply not shared with the public.

These models are dense and highly mathematical, yet there must be a better effort in explaining these so that the public can have confidence in decisions/directions made.

I oppose all of the proposed build alternatives retained for detailed study -- all of which propose addition of managed toll lanes to expand I-495 & I-270 -- and support the “no build” alternative. I completely agree with the extensive and detailed analyses prepared and submitted separately by the Maryland National Capital Park and Planning Commission and by the Sierra Club Maryland Chapter that the Draft Environmental Impact Statement (DEIS) and Draft Section 4(f) Evaluation are flawed in myriad important ways and that the project should not go forward.

The DEIS and Draft Section 4(f) Evaluation do not adequately analyze or present the true costs of the project or its numerous significant impacts on public or private property. The DEIS presents vague and incomplete estimates of costs that will be borne by Maryland taxpayers. The project will irreparably damage our regional environment, increase air, water and noise pollution, harm human health, particularly in low income and minority communities, and will historic and cultural assets along the proposed route. However, the DEIS does not adequately consider these harms or adequately define how they will be avoided or mitigated. Therefore, the DEIS does not provide the public or the deciding agencies with a meaningful opportunity to review and consider the impacts of the proposed road expansion. In addition, the joint Clean Water Act § 404 permit application for the

expansion should be denied because it fails to meet Clean Water Act requirements and is not in the public interest.

This project has been fundamentally flawed from the start – with an unreasonably narrow purpose and need statement designed to support one favored alternative, failure to consider multi-modal transit and transportation alternatives adequately, failure to consider public opposition to the project adequately, and use of inaccurate traffic and financial assumptions. The proposed managed lanes will only monetize traffic congestion, The DEIS confirms what many have suspected from the inception of this project: that the project will, in fact, cost Maryland taxpayers a lot of money but will not measurably benefit the vast majority of commuters.

In addition, by limiting the scope of the DEIS to a segment that is only part of the overall P3 Program, the DEIS restricts consideration of partial or full public transportation options (such as expanding the Maryland Area Regional Commuter line) that would be viable if evaluated based on the entire P3 Program. Going forward with this segmentation will also prevent similar public transit options from being considered when the other two segments go through the NEPA process.

Ignoring Upper I-270 issues in this DEIS also precludes an adequate evaluation of the overall P3 project's direct and indirect impacts, cumulative effects, and foreseeable project risks (such as the private developer not being willing to complete Upper I-270, and the fact that that portion would not meet the narrow purpose and need or be profitable without state subsidy). Furthermore, former Transportation Secretary Pete Rahn disclosed during an October 2019 interview that I-270 was divided into two phases because of issues related to the Monocacy Battlefield. Monocacy National Battlefield, which directly touches the current Upper I-270, is on the National Register of Historic Places. Any attempts to expand that highway will create significant environmental and Section 4(f) impacts. Attempting to avoid analysis of a unique segment is not a valid reason to segment a proposal's NEPA review. End points may not be created simply to avoid proper analysis of environmental impacts. No action on Lower I-270 should proceed without completing a NEPA-compliant evaluation of impacts arising from widening Upper I-270 and studying the cumulative impacts of this single project.

Furthermore, the perils of using P3 agreements have been made abundantly clear by the recent problems with the Purple Line P3 partnership. MDOT needs to pause any further consideration of this even larger P3 project until the lessons learned from the Purple Line P3 are fully known and thoroughly analyzed to avoid putting Maryland taxpayers at even more risk.

Finally, work situations, commuting, and traffic have been forever altered by telework and Zoom. The proposed highway project is an outdated 1950s solution to traffic management, and both the project and the DEIS completely ignore the new reality in our post-COVID 21st century. Similar toll lanes in our region, around the US, and around the world are losing money. This is not the correct path forward for Maryland.

Therefore, this project should be terminated. MDOT should go back to the drawing board and focus on mass transit options for our entire extended region which are favored by a majority of affected residents.

Subject: Draft Environmental Impact Statement for I-495/I-270 Tollway Expansion

I am very concerned about the cost to the I-495/I-270 Tollway Expansion. These points need to be addressed:

1. The cost of moving the water pipes and impact on citizens throughout Montgomery and Prince George's Counties.
2. There is no monitoring station of air quality near the southern segment of the I-495 study area.
3. High Occupancy Toll (HOT) Lanes should be free for vehicles with three or more passengers rather than just a reduced rate. This will promote more sustainable commuting by encouraging carpooling.
4. MDOT SHA needs to address future traffic conditions. Since Covid, traffic may be much different, as many changes have affected residents' work schedules from home.
5. MDOT SHA must provide details to storm water management mitigation and methodologies. Our future runoffs may vary due to our climate.
6. MDOT SHA needs to address noise levels impacting surrounding communities.
7. Great concern about the financial cost, especially in light of what has happened to the Purple line project and Covid.
8. We need to know more about the extent to which the phasing will exacerbate socio-economic impacts. This includes suburban sprawl, economic gap in the Washington Metropolitan Region with regard to minority communities, African-American cemeteries and communities of color within MWCOG economic areas.
9. High Occupancy Toll Lanes should be free for vehicles with 3 or more passengers so as to promote more carpooling.
10. The County residents expect assurance that the State is meeting with impacted individuals and providing ample and accessible notification throughout the process. We have concerns regarding the overall manner of transparency, timing and notice given for public outreach considering the length of the document.

Sincerely, Kathleen Bartolomeo

This is only going to bring future problems. It is still unclear what the impact of COVID-19 will have on metropolitan cities, this expansion may not even be necessary long term if people start moving out farther anyways. I'm so concerned about the environmental impact this expansion may have for my children's future. Please at least postpone this project until we can see what the impact of COVID and do another environmental study before committing to such a large and expensive project that may not even provide as much benefit as it was expected a year or two ago.

Subject: Opposition to I-495/I-270 Tollway Expansion

I am writing to express my opposition to the I-495/I-270 tollway expansion. I am in support of a no-build option. We cannot build our way out of traffic and congestion problems. We need a multi-modal transportation solution. I live in a neighborhood that is not far from the highway; I live within biking and walking distance of the two dozen Rockville homes threatened with demolition. It's appalling that the government thinks that demolition of livable, affordable homes -- be it 24 homes or 2,400 -- is an acceptable solution in transportation, particularly when people need homes to live in and communities are in need of housing.

Furthermore, enough research and evidence shows that highway expansions do not help with traffic congestion and that they can, in fact, bring about worsening traffic and congestion. Equally important is the environmental degradation and what has come to light about the DEIS provides enough evidence to show how the highway expansion will only harm the environment.

Lastly, the pandemic has brought about major changes in how we live, work, play and travel. To move ahead with the highway expansion when the U.S. population is undergoing a seismic shift in its daily habits because of COVID-19 is completely ignoring reality and the fact that congestion may not be the issue that it once was pre-pandemic and that travel patterns have been altered for the foreseeable future.

Highway expansion in a congested urban area such as ours is a 20th century solution to 21st century issues. I want our government to work on consensus among its constituents for our transportation with innovative rail solutions, shoring up Metro and working on systemic issues like changing and evolving our car culture into a culture that is inclusive of myriad ways to travel our communities without relying on cars.

Please halt the plans for highway expansion. Please transition your state workforce in transportation to achieving innovative transportation solutions for our region instead of this misguided, 20th century method that is outdated and will harm future generations.

Joint Public Hearing Date: 8/25/20

Type/Session: Live/Afternoon

Transcription:

Good afternoon. My name is Becky Batt (B-a-t-t). My address is [REDACTED] Anderson Avenue, Rockville 20850. 20850.

I am absolutely opposed to the Managed Lane Plan to add lanes to 495 and 270. Maryland is in the midst of a serious public health crisis which produced a severe economic crisis. The plan to widen 495 and 270 would be extremely expensive for taxpayers, would cause devastating destruction to our fragile environment, and would not even help traffic to move faster. According to the Washington Post on July 11, 2020, adding toll lanes to 270 and 495 could require a government subsidy of up to one billion dollars. The Post reported on March 12, 2020, that the Washington Suburban Sanitary Commission estimated that moving 70 miles of water pipes will cost up to two billion dollars. The Post also reported that if the P3 that is building the Purple Line pulls out, Maryland taxpayers will be left with a debt of one billion dollars. The International Bridge, Tunnel and Turnpike Association recently asked Congress for a bailout of more than nine billion dollars. Nine billion dollars. MDOT's claim that P3s won't cost the taxpayers a penny is definitely not true. The Post reported on July 11, 2020, that the plan would impact about 1,500 properties, decimate 1,500 acres of forest, and negatively impact 47 parks. This means that countless trees would be destroyed which will mean even more noise and air pollution. We are still in an environmental crisis. The plan to widen the highways would exacerbate environmental damage rather than do anything to combat climate change and plan for Maryland's future. Finally, the Draft Environmental Impact Study, itself, states that evening rush hour traffic on northbound 270 will be worse in the regular lanes if toll lanes are added and states that traffic north of Shady Grove Road will back up even more than it does now. This makes no sense whatsoever. Please, think about what is best for Maryland and choose the No-build Option. Thank you

Ms. Rebecca Batt

[REDACTED]

It is time to STOP the plan to widen 495 and 270. Widening the highways would cause a severe financial burden on MD taxpayers during a financial crisis, would cause irremediable harm to our fragile environment, and would not help traffic to move faster. All of this information is in the DEIS. MD taxpayers will probably end up paying for the Purple Line. They do not want to pay for widening 270 and 495. Maryland should NOT move forward with a destructive, expensive plan that will not reduce traffic congestion. The NO Build option is the only option that makes sense for our state.

Dear Mrs. Batt:

Thank you for contacting Governor Larry Hogan regarding the I-495 and I-270 Public-Private Partnership (P3) Program and Managed Lanes Study. I am honored to respond on behalf of the Hogan Administration.

The I-495 & I-270 Managed Lanes Study Draft Environmental Impact Statement (DEIS) became available for public review on July 10th. The DEIS provides a summary of the myriad of technical analyses completed for the Study. The DEIS and supporting technical reports that can be viewed on the P3 Program webpage at www.495-270-P3.com/DEIS or in hard copy at 21 locations around the study area. The list of DEIS viewing locations can also be found on the P3 Program webpage.

The Maryland Department of Transportation State Highway Administration (MDOT SHA) and the Federal Highway Administration will consider and evaluate comments on the DEIS and will respond to substantive comments in the Final Environmental Impact Statement. Comments on the DEIS will be accepted until November 9, 2020 by 11:59 pm. Comments received after November 9, 2020 will be reviewed and considered to the extent practicable.

Thank you again for contacting Governor Hogan. We appreciate hearing from you. If you need further assistance, please feel free to contact Jeffrey T. Folden, P.E., DBIA, MDOT SHA I-495 & I-270 P3 Office Deputy Director at 410-637-3321, or via email at jfolden1@mdot.maryland.gov. Mr. Folden will be happy to assist you.

Sincerely,

Subject: We oppose the plan to widen 270 and 495

Dear MDOT,

We strongly oppose the plan to widen 270 and 495.

The plan to widen 495 and 270 would be extremely expensive for Maryland taxpayers, would cause devastating destruction to our fragile environment and would not even help traffic to move faster. This plan would be a disaster to our state and our citizens.

No one wants to pay tolls that could reach \$50 one way from Frederick to Rockville. This figure came from an analysis by the Metropolitan Washington Council of Governments. The Washington Post reported on 7/11/20 that adding toll lanes to 270 and 495 could "require a government subsidy of \$482 to \$1 billion". The Post reported on 3/12/20 that the Washington Suburban Sanitary Commission estimated that moving 70 miles of water pipes, which would be necessary if toll lanes are added, will cost up to \$2 billion. The Post reported on 8/12/20 that if the P3 company that was building the Purple Line dissolved, taxpayers would be stuck with \$1 billion. That is exactly what happened. The P3 that was supposed to build the Purple Line may be a little different from the P3 MDOT proposes to widen 270 and 495, but they are basically the same. The International Bridge, Tunnel and Turnpike Association, an organization that represents private toll companies, recently asked Congress for a bailout of more than \$9 billion. P3s around the country are failing. P3s are not free. **Maryland cannot afford the prohibitively expensive plan to widen 495 and 270 during the current economic crisis.**

According to the National Parks Conservation Association, the plan to widen 270 and 495 would adversely affect 47 different parks, 1500 acres of forest canopy, 30 miles of streams, 53 acres of wetlands and 410 acres of "unique and sensitive areas" as defined by the state. Maryland's Greenhouse Gas Reduction Act states that greenhouse gas reductions should be reduced by 40% by the year 2030. The plan to widen the two highways would increase greenhouse gases and increase air pollution. Widening the highways would also increase noise pollution. The Washington Post reported on 10/18/20 that the plan to widen the highways would adversely impact an historic Black cemetery. We have lived quite close to 270 for over 30 years. There is a small grove of trees that provides a little protection between our home and the highway. The plan to widen 270 would destroy the trees so it would feel as if 270 was coming through our bedroom. The world is facing a climate crisis. **Maryland needs to protect our environment, not escalate the climate crisis by widening highways.**

Finally, the Draft Environmental Impact Study states that evening commute traffic on northbound 270 would actually be **slower** in the regular lanes if toll lanes are added and states that traffic north of Shady Grove Road will **back up more** than it did prior to the pandemic. This makes no sense. All of the traffic data used to promote this plan is completely outdated because it was conducted prior to the pandemic. Business will be conducted differently in the future as more people work from home

indefinitely and more companies give up brick and mortar buildings. **Maryland should not move forward with an expensive, destructive plan that will not reduce traffic congestion.**

We support the No-Build option.

Sincerely,

Rebecca and Mitchell Batt

Anthony Batteli

More concrete when more mass transit systems should be the lesson of the day. Technology allows for smart use of green energy to shuttle workers and visitors throughout the beltway efficiently and cost effective than the billions of dollars to construct and maintain for the life of additional concrete ribbons of parkway.

Lauren Bauer

I oppose this project.

James Baughman

I oppose this project and support the NO-BUILD option.

Karen Baughman

I oppose this project and support the No-Build option.

Subject: Comments on the I-495 and I-270 Managed Lanes Study Draft Environmental Impact Statement (DEIS)

I DO NOT support this project.

The following are two of my concerns with the I-495 and I-270 Managed Lanes Study Draft Environmental Impact Statement (DEIS):

Prior to the DEIS, the Agencies unreasonably defined the study's purpose and need so narrowly that they only considered alternatives which involved two to four managed highway lanes. The Agencies did not analyze reasonable public transit options. For example, the Agencies did not compare the carbon footprint per passenger-mile of adding the considered alternatives versus public transit options.

Also, the DEIS does not analyze how increased stormwater runoff from the proposed expansion will impact local waterways.

Thank-you for your consideration,

Kenneth Bawer
[REDACTED] Cleveland Ct
Rockville, MD 20850

Bonnie Beavers

I strongly support the no-build option. Please focus on finishing the Purple Line. Spending huge sums and taking property for a project that will only increase traffic is counterproductive. Think progressively and of mass transit. A monorail would be an excellent solution to the 270 problem.

Krisna Becker

The proposed expansion will further exacerbate climate change and hurt Maryland's ability to reduce its greenhouse gas emissions by 40% by 2030 under Maryland's Greenhouse Gas Reduction Act. DEIS falsely minimizes this impact by relying on estimates of fuel efficiency increases based on fuel efficiency standards which have been revoked.

The DEIS does not consider how COVID-19 will impact the financial viability of the proposed project. MDOT SHA intends to build the project as a public-private partnership ("P3"). Under this model, any reduction in anticipated toll revenue can derail funding potential. Tollway revenue in Maryland is down 40% and hundreds of millions of dollars, and tollway operators across the country have sought billions of dollars in taxpayer bailout money. Therefore, it is vital that MDOT SHA analyze COVID-19's long-term impact on toll revenue and the financial viability of the proposed project. Taxpayers should not be subsidizing or bailing out this project.

Megan Beecham

The Beltway highway expansion is the worst solution imaginable for our transportation problems. All studies have shown that when you add more lanes or more roads, you simply bring in more cars to fill them and traffic gets worse, not better. The highway expansion will lock us in to more sprawl for the next 50 years, impose enormous financial risks, and threaten the lives of people, wildlife, waterways, and the environment. we see the havoc being wreaked by climate change every day and this project will only exacerbate that.

Brian Belanger

I think this project is a mistake. I fear that a public private partnership is likely to fail just like the Purple Line project. Toll lanes are unfair. Rich people can pay the tolls. Poor people cannot afford to pay and get stuck in traffic. If the state does go ahead with more lanes, it should be paid for with state money and there should be no tolls

Dian Belanger

Do NOT widen I-270 and/or I-495 with Lexus Lanes. More traffic lanes, and more traffic, threaten the fragile environment (pollution, heat, runoff) and cruelly impact homes, parks, and forests along the route. Tolls impose a heavy financial burden on those who have the slimmest resources and most need to use the road.

Expand mass transit--with rolling stock of quantity, quality, frequency, and reliability sufficient to attract riders.

We have seen the failure of public-private partnership with the Purple Line. Infrastructure used by all should be the property of and paid for by all. Taxes are the price of civilization.

11/8/2020

Re: I-495 and I-270 Draft Environmental Impact Statement

To whom it may concern:

I request that the state consider delaying making a decision on the I-270 project and issuing a final environmental impact statement until a few years after the pandemic has ended. I would ask that the state consider the following:

- 1) The pandemic is changing the way in which we do business in the United States. Companies and government agencies are working entirely remotely. We should anticipate an increase in telework that will remain even after the pandemic. According to a survey by the Metropolitan Council of Governments, even after the pandemic twenty percent of businesses in the region will continue to let their employees telework at pandemic levels. Far more are likely to permit more telework than before the pandemic but not 100% telework as is common during the pandemic. The frequency with which people will need to commute for work is in shift. We should delay making such a large decision with significant economic and environmental impacts until a few years after the pandemic to better predict the need for the project and to evaluate the alternatives. See: <https://www.bizjournals.com/washington/news/2020/09/16/teleworking-survey-mwcog.html>.
- 2) The economic impacts of the project cannot be predicted. The DEIS states that additional state subsidies may be necessary if revenue is less than expected (i.e., traffic demand is less than expected (2-49)). Rather than take a risk on projected revenues at this time, it would be more prudent to delay a decision until traffic projections can be better predicted.
- 3) If the project cannot be put on hold, consider making decisions in a segmented way. For example, begin making decisions on the portions of the project that are most unlikely to be impacted. For example, 495 is largely a four-lane highway. It would be reasonable to assume that 495 may need widening regardless. However, I-270 which is already a six lane highway may not need further widening. Consider moving forward on 495 expansions and delay making a decision on I-270.
- 4) If a decision must be made on I-270, opt for the MD-200 traffic diversion option. The DEIS states, "In the near term, the premise of this alternative has merit due to the currently available capacity on MD 200, a Maryland Transportation Authority (MDTA) facility." If the state feels that the need is so great to move forward with changes to I-270, this option could be adopted in the interim. This would give the state additional time to see how dramatically traffic patterns have shifted following the pandemic.

- 5) The state is required by law to reduce its greenhouse gas emissions under the Maryland Greenhouse Gas Reduction Act. The DEIS states that the build alternatives will increase greenhouse gas emissions. The single largest source of greenhouse gas emissions today comes from the transportation sector. Rather than invest in a transit option that will increase greenhouse gas emissions, making it that much more difficult to reach our emission reduction requirements, lets reevaluate whether all of the project is needed or whether only portions are needed.

Thank you very much for considering my comments.

Sincerely,
Alana Bell

chris belles

Hello. I would like to express my enthusiastic support for the 270/495 express lanes project. These lanes work great on the beltway in Virginia. It makes complete sense to continue them north into Maryland and up 270. Once Covid is done, people may not commute as much, but they will indeed travel for pleasure. And off-peak delays on 495/270 are often just as bad as delays during "rush hour". So even in a post-Covid world, the express lanes make sense. Please build the express lanes. They have been great in Virginia, and I think adopting them on a regional basis is a fabulous idea. Thank You.

Jordan Benderly

I am a property owner in Montgomery County, although I reside in DC.

I am an urban planner, retired at this point. It is a well known fact that building more lanes or more highways is a very temporary solution, actually a non-solution. The result in no time will be even more traffic and congestion. I am opposed to the expansion of 495 & I-270 on professional planning grounds.

As a citizen concerned about the environment, I am also distressed at the expansion plans. Again, I am opposed from a conservation standpoint as well.

Thank you for the opportunity to comment.

Jordan Benderly

Craig Berk

I strongly favor widening 495 and 270 in Montgomery County. The time wasted every day sitting in traffic due to congestion is unacceptable for an area that is considered one of the wealthiest in the Country. During rush hour a 10 mile trip can take an hour, sometimes more. The same trip on a weekend takes 15 minutes.

Having the same number of lanes as over 25 years ago, is a disaster. More than doubling the number of cars on the road, but not increasing the capacity of those roads is the wrong thing to do, or in this case not do.

To: MLS-NEPA-P3
Subject: No to Beltway Expansion

I oppose the I-495 and I-270 project. I support the no-build option.

As a Maryland resident, I am writing with deep concern about the proposed public-private partnership (P3) to add toll lanes to I-495 and I-270. The potential dangers that come with the project are not worth the risk. I am worried about increased air and water pollution, the lack of transparency, the projected costly tolls, the disruption to communities, the unknowns due to the pandemic, and so much more.

It is clear that continued attempts to expand our streets and highways through private often foreign support are not economically feasible resulting in bankruptcy for the state when the costs exceed the planned expansion. The failure of the Purple Line is just one example. If we want to save our neighborhoods and parks for future generations we must choose other options for transportation and work spaces.

I support reversible lanes on I-270, more telecommuting, increased, transit, commuter bus lanes, and a dedicated funding source for highway and transit.

(USACE Application Number: NAB-2018-02152)

Sincerely ,
Janet V. Berry

Rick Berzon

To Whom It May Concern:

I oppose the I-495 & I-270 toll lane project and support a no-build option.

I believe the plan to widen I-270 will only add to the traffic congestion that many of us experience as we travel to and from work. In addition, construction will affect numerous communities and neighborhoods that are currently home to Maryland citizens. And then there is the cost, using monies that can be better directed within the state.

Please consider alternative approaches to achieve the same ends; and allow more time for the legislature to debate and consider other possibilities.

Sincerely,
Dr. Rick Berzon

Transcription:

Thank you. My name is Janna Bialek. J-A-N-N-A B-I-A, B as in boy, I-A-L-E-K and I live at [REDACTED] Glenmoor Drive in North Chevy Chase. My house backs onto the Beltway between Kensington Parkway and Beach Drive overpasses. I am speaking in support of the No Build alternative as I believe no other alternatives are even mildly realistic in addressing their stated goals. Specifically, the DEIS and JPA do not adequately consider the fact that the Beltway retaining wall in our section of the inner loop is stacked in two parts. An approximately 20-foot-high barrier of fill that brings the road to grade, and then another 20 feet of noise barrier. You can find this area in the Impact Plate 13A, page 24 of Part 2 of the JPA. The LOD shown on this and other maps in the DEIS ignore, among many other things, the environmental sound pollution and engineering impact of bringing in this huge amount of fill. The specified 30, 300 feet from baseline LOD does not seem realistic. While I am not an engineer, the results of this action hits close to home; in fact, right in my backyard. This project would impact my home directly as well as those of my neighbors. We have one of the last remaining spring-fed ponds in a neighborhood that used to have, before the Beltway and other development, an abundance of them.

There was a wildlife corridor along the Beltway wall that extends the habitat possibilities of Rock Creek Park and the Audubon. I have discussed with Montgomery County biologists the importance of this area as a pathway for countless deer, birds, rabbits, fox, and the other wildlife that are regularly seen here. It is heavily wooded with mature sycamore, oak, maple, and other trees. But more importantly, it has the increasingly rare thing that wildlife desperately needs to survive and thrive; a source of clean fresh water, one that will suffer degradation from every build alternative in this project. Believe it or not, this wildlife habitat and artisanal springs can be found right behind the Beltway wall. The 15-foot natural pond in my backyard is missing from the map I referenced in the JPA and feeds into a culvert under the Beltway and into the main stem of Rock Creek. Most of the other ephemeral and intermittent water sources in this area are also missing from the map. The stream from my property is marked as intermittent; however, it is never, even in the driest years, dried up. The snakes, crayfish, birds, families of deer, and even occasional heron, testify to its importance as a reliable water source. Please don't, please don't ignore their needs by pursuing this ill-considered project. Thank you for your time.

Subject: Comments on DEIS for P-3 proposal

November 5, 2020

Dear Ms. Choplin,

For 26 years as a resident of [REDACTED] Glenmoor Drive in North Chevy Chase, a 20-foot retaining wall topped by a 20-foot noise barrier has separated my backyard from the Beltway. Air pollution and excessive noise are part of my daily life, but the mature trees, nature trails, a lovely and transit-friendly neighborhood, and easily accessible parks and a nature sanctuary offset the noise, pollution and degradation of this road to the quality of our lives.

The proposed P-3 partnership makes no sense in alleviating the impact of traffic on my quality of life, and in fact would degrade it irreconcilably in both the short and the long term. Already, our street's property values (in this booming market) are impacted by the uncertainty of this project and the problems it would cause.

The DEIS is woefully inadequate in addressing the problems brought about by this project. The only appropriate use of taxpayer money (and taxpayers WILL be paying the bill, no matter what your estimates say!) is to cut our losses and go with the NO BUILD ALTERNATIVE.

NOISE

The "extensive" charts and analysis provided in Appendix J of the DEIS are completely meaningless to a neighborhood that borders the beltway. My neighborhood, identified as NSA 1-36, will not even receive noise abatement improvements, due to "topography", which I assume means the problem of needing 20 feet of fill to reach the grade of the road. I could not find evidence that noise levels were even taken at our section.

As you are hopefully aware, the beltway between Connecticut and Georgia Avenues is a long, curvy hill. Trucks apply airbrakes descending the hill, which are heard from far away; ascending it they struggle to navigate the curves, leaving clots of traffic in their wake. This topographical problem, whose effects are heard day and night, will not be alleviated by any of the build alternatives, and in fact will be made much worse during what would be a nightmare of construction. Regardless of the numbers you have included which try to prove the contrary, noise barriers do little to offset the constant thrum of the beltway to our neighborhood.

While your measurements define ambient parameters, it is also the INTERMITTENT sounds—the blurt of air brakes, the hourly buzz of cars with illegal mufflers, the crash of vehicles—that diminish our quality of life. New lanes will not mitigate this issue, but in fact will make it worse, in three ways: by (during construction) increasing the backups and noise, *especially at night when we are sleeping*; by making it harder for trucks to navigate the turns, since the road will not in any way be straightened or flattened; and by offering what I call "midnight riders" who will undoubtedly race their sports cars with illegally altered mufflers on what will now be a less-trafficked lane.

While I am not a sound engineer, someone who has lived beside the beltway for 25 years has an equally expert knowledge of the intersection of noise and quality of life. While the DEIS addresses noise monitoring in a perfunctory way, I view noise differently—as ambient, and as sporadic. We call, in my neighborhood, the ambient, constant noise of beltway traffic "falling water," perhaps kidding ourselves into a kind of acceptance of its presence. But sporadic noise—the bull-elephant blurt of a semi's airbrakes, the illegal noise of an altered muffler (so loud that it can be heard from

three exits away as it rounds the turns of the road), the horns and brakes of rush hour, and the terrible sound of a crash and sickening silence afterward—these are life-disruptors that also never go away, and are hidden inside aggregated noise measurements. Perhaps this is a quality of life issue as well, but it is not addressed anywhere in this huge and incomplete document.

TREE LOSS

In addition, noise will be exacerbated by the resulting tree loss necessary to make way for the lanes. Anyone who has driven the beltway between I-270 and I-95 knows that it is lined by a wide corridor of trees stretching for most of its length. They did not grow there overnight—they are mature, canopy trees. All build alternatives have, according to your document, an estimated tree loss impact of 1,434 to 1,515 acres. Given that these are mature trees, even if there is a loss at this level, it will be 50 years or more before this canopy is restored. *There is no way to mitigate this loss* in the face of fighting global warming. Trees capture carbon, filter pollution, store and filter groundwater and maintain healthy soil communities. The impact of losing these trees is unconscionable and irreconcilable. **Further, the DEIS does not even address the impacts this project will have on climate change or calculate in any meaningful way the impact of the loss of these trees.**

HABITAT LOSS

In addition, the DEIS did not consider that this corridor bordering the beltway wall on both sides is especially important to several animals, both as habitat and for connectivity between habitats. Since it borders parkland, the value of park habitat is increased when ancillary areas such as the backyards in our neighborhood are available. And the impact of construction in opening an area where deer are habituated to follow a formerly-closed path will certainly increase the number of deer/vehicle collisions, a fact not considered in the DEIS. In conversation on another matter with county wildlife biologist Ryan Butler, he told me that, for my neighborhood alone, the estimated deer population was near 100 individuals per square mile. The habitat value of this corridor has increased considering the deer barriers erected by the Audubon Naturalist Society. My backyard has nurseried two fawns last summer; there are at least 3 family groups that I have detected using the pathway of streams and brush between the neighborhood and the retaining wall. I have counted 5 species of woodpeckers using these trees for nesting and foraging, as well as a wood thrush (almost completely gone from our area), raptors, migratory songbirds and even a heron that fished the artesian pond in our backyard. The streams of this wet area behind our houses have housed crayfish and provide birds with an important water source.

I appreciate your time in considering these comments, and look forward to their being addressed if a final document is ever developed. We were told by the MDOT that the problems of Beltway traffic would be mitigated by building the ICC. Admitting this failure, you are proposing another one, and my support of the No-Build Alternative is informed by your outdated approach to solving our transportation issues in a way that is sustainable and makes real sense. Building more roads to solve traffic problems has not worked ANYWHERE (witness your own ICC); it is time to consider this reality and move toward real solutions for transit, not just car-oriented failures.

Sincerely,

Janna Bialek

North Chevy Chase
[REDACTED]

Name: Ron Bialek

Joint Public Hearing Date: 9/3/2020

Type/Session: Live Testimony/Evening

Transcription:

Good evening, my name is Ron Bialek, B-I-A-L-E-K. My house abuts the Beltway at [REDACTED] Glenmore Drive, Chevy Chase, Maryland. I am a public health professional more than 35 years of experience, including 10 years on the faculty of Johns Hopkins School of Public Health and 25 years as CEO of the Public Health Foundation. Well, we've helped one of 500 organizations around the country in their efforts to achieve healthier communities. I support the no build option moving forward with any of the alternatives retained and evaluated in this EIS will impact my health, my family's health and the health of individuals and communities in and around the study area and areas not studied, such as roads to and from the Beltway and 270. By law and reinforced by the CDC, an EIS must consider human health. Simply stating in the EIS, quote, human health has been considered end quote, with no backup fact, no data, data sources being provided does not meet the legal requirements for considering human health. The study must be redone using facts and data, respected valid and reliable data sources and modeling of impacts of human health. I know what it means to consider human health in the study and how agencies can skirt the issue when they don't want damaging information exposed. The study is either negligent and not adequately considering human health or a decision was made to hide the facts. One of the most grievous examples of how human health was not adequately considered is found in Chapter four in Appendix 8, both addressing environmental justice and the impact on minority communities. The study notes that there are 199 black groups within the Environmental Justice Analysis area and 107 have minority populations equal to or greater than 50 percent. Unfortunately, the health impacts of minority communities have been excluded from the document. Chapter four in Appendix E states that excess emissions may be reduced. Even in the unlikely event this is true, those emissions will be closer where people live and play with many fewer trees to filter the pollutants. And what about emissions increases on the roads to and from the Beltway to 270? In Chapter four, there are 61. The following statement is made. Information is currently incomplete or unavailable to credibly predict the study's specific health impacts. This is an inaccurate statement. Valid and reliable data exist and science exists to model and predict health impacts. Unfortunately, none of these are addressed in the study. And looking at the study team of over 70 individuals, I was unable to find a single individual with an MPH degree in epidemiology, with the expertise to analyze the data and human health impacts. The absence of facts, data and data sources about the impacts on human health and no evidence sound public health science has been used in developing D- DEIS is unacceptable and is an embarrassment to the state and to the citizens. In the event that any of the global trends continue to be considered, this DEIS must be redone. That is a legal requirement. Thank you.

Subject: Comments on I-495 and I-270 Managed Lanes Study Draft Environmental Impact Statement/Draft Section 4(f) Evaluation
Attachments: undefined; Written Comments - 11-8-2020.pdf

Dear Ms. Choplin:

Please find attached comments on I-495 and I-270 Managed Lanes Study Draft Environmental Impact Statement/Draft Section 4(f) Evaluation. Potential impacts on human health have been ignored in this DEIS, the environmental justice analysis is woefully incomplete, and realities of traffic flow have not been considered.

I look forward to hearing that the State of Maryland will redo the DEIS to be compliant NEPA requires to analyze and assess potential impacts on human health.

Sincerely,

Ron Bialek

November 8, 2020

Dear Ms. Choplin:

First and foremost, I support the no build option. The Draft Environmental Impact Statement (DEIS) is incomplete, contains erroneous and fictitious information, and does a disservice to the NEPA process and the citizens of the State of Maryland. Potential impacts on human health have been ignored, the environmental justice analysis is woefully incomplete, and realities of traffic flow have not been considered.

Moving forward with **any** of the alternatives retained and evaluated in the DEIS will impact my health, my families health, and the health of individuals and communities in and around the study area, and areas not studied, such roads to and from I-495 and I-270.

As a public health professional with more than 35 years of experience and President of the Public Health Foundation, I work to support healthier communities. My organization has helped hundreds of communities understand what is impacting individual and community health, and actions that are necessary for preventing adverse health impacts and improving health. It is unfortunate that this DEIS failed to use sound public health data and science to more completely analyze and assess impacts on human health.

Potential Human Health Impacts Have Not Been Adequately Analyzed and Assessed

By law, and reinforced by the Centers for Disease Control and Prevention (CDC), an EIS must consider human health. Simply stating in the DEIS, "human health has been considered," with no backup facts, data, or data sources being provided **does not meet the legal requirement for considering human health**. The study **must** be redone using facts and data; respected, valid, and reliable data sources; and modeling of impacts on human health. I know what it means to consider human health in a study, and how agencies can skirt the issue when they don't want damaging information exposed. This study is either negligent in not adequately considering human health, or a decision was made to hide the facts.

There are many relevant and essential data sources that should have been considered in conducting this DEIS, but were either ignored or underutilized. These data sources include:

- Vital Statistics
- Maryland CRISP
- Maryland Health Services Cost Review Commission hospital discharge data

- Behavioral Risk Factor Surveillance System
- National Health Interview Survey
- National Health and Nutrition Examination Survey

These, and other data sources, are essential for: 1) determining baseline health information; 2) assessing trends and health impacts of I-495 and I-270; and 3) modeling potential impacts on health based on the various build alternatives.

In Chapter 4-61, the following statement is made, "Information is currently incomplete or unavailable to credibly predict the study-specific health impacts." This is an inaccurate statement. Valid and reliable data exist, and the science exists to model and predict health impacts. Unfortunately, none of these are addressed in the study. And, looking at the study team of over 70 individuals, I was unable to find a single individual with an MPH, or a degree in epidemiology, with the expertise to analyze the health data and model human health impacts.

Chapter 4 and Appendix E state that excessive emissions may be reduced. Even in the unlikely event this is true, those emissions will be closer to where people live and play, with many fewer trees to filter the pollutants. And what about emissions increases on the roads to and from I-495 and I-270? With more cars on these highways, feeder roads such as Connecticut Avenue will see increased traffic. Many families live along this road, and with the new development on Connecticut Avenue and Manor Road, there is likely to be a significant impact on human health. The fact that emissions will indeed increase on feeder roads, Connecticut Avenue and many others, was entirely ignored.

One health issue partially addressed was lead exposure. But, the analysis misses the boat. The DEIS suggests that lead may have entered the soil due to accidents. True, but the majority of lead entering the soil is due to vehicle traffic over the years prior to lead being banned in gasoline. The DEIS suggested that lead may need to be addressed as part of the Preliminary Site Investigations. However, the lead issue must be addressed now. There are studies in the peer reviewed and grey literature noting how disturbing lead in soil results in childhood lead poisoning. Sampling the soil around the study areas is essential prior to any additional studying of build options.

The DEIS goes on to suggest that human health implications may be addressed in the FEIS (4-143). There is no indication of how this will be done and no commitment to do this at all. There is no indication anywhere in the DEIS that there is a plan to more completely and accurately analyze and assess impacts on human health. It is unacceptable for the DEIS to have ignored potential health impacts such as cardiovascular disease, chronic obstructive pulmonary disease, childhood lead poisoning, asthma, various cancers, and many other health conditions. To comply with NEPA, human health **MUST** be considered using data and science.

Environmental Justice Analysis is Incomplete and Woefully Inadequate

One of the most grievous examples of how human health was not adequately considered is found in Chapter 4 and Appendix E – both addressing environmental justice and the impact on minority communities. The study notes that there are 199 block groups within the Environmental Justice Analysis Area, and 107 have minority populations equal to or above 50 percent. Unfortunately, the **health impacts on minority communities** have been excluded from the study.

It is a known fact that childhood lead poisoning impacts communities of color at a far higher rate than other communities. As noted by CDC and many research organizations, childhood lead poisoning results in life-long social, economic, and health damage resulting from lower IQ, lower school performance,

lower ability to pay attention, and other health and behavioral-related problems. Additionally, in a recent study completed by the University of Wisconsin-Milwaukee, the researchers found that over half of gun violence perpetrators and victims in Milwaukee had elevated blood lead levels as children. The long-term damage childhood lead poisoning causes makes it unacceptable for any DEIS to ignore potential childhood lead exposure that may be caused when soil containing decades of lead is disturbed during construction.

4-136 of the DEIS states "...consideration also is given effects on....human health and safety..." (4.21.5). Where is there attention being paid to human health? There is a single paragraph in Appendix E, a section of the DEIS that allegedly addresses environmental justice. One single paragraph!! The treatment of environmental justice issues in the DEIS is potentially damaging and is yet another contributor to systemic racism.

Realities of Traffic Flow Not Considered

4-137 of the DEIS states that excessive emissions may be reduced. In the unlikely event this is true, putting the emissions closer to people will increase human exposure. In addition, reducing trees to filter the air will absolutely increase human exposure. This reality of traffic patterns and the impact on human health were not addressed in the DEIS.

The DEIS also suggests that emissions will be reduced on feeder roads. This is unrealistic and lacks any factual information in this determination. Cars will exit and enter these highways from feeder roads. Increasing the number of cars on I-495 and I-270 will increase traffic on those roads and impact human health.

Poor design of I-495 also is ignored by the DEIS. There are many dangerous curves that both slow down traffic and result in accidents. If lanes are added to I-495, the curves will become even more dramatic. This will either slow traffic (the opposite of the intent of the build options) or increase accidents. As noted in 2020 by the Maryland State police, serious crashes have increased around the "Big Curve." Between March 2020 and September 2020, there have been 36 serious crashes involving commercial vehicles on I-495 where I-270 merges with I-495. The Maryland State Highway Administration (MSHA) has noted that this is a serious problem, and initially recommended a maximum speed of 50 miles per hour. More recently, the MSHA has posted electronic signs on this portion of I-495 to encourage a maximum speed of 45 miles per hour. While the Maryland State police and MSHA have diagnosed this tremendous health and safety problem, this problem has been entirely ignored in the DEIS. Additionally, the design elements of road expansion do not reduce the problem of dangerous curves on I-495.

The absence of facts, data, and data sources about the impacts on human health, and no evidence that sound public health science has been used in developing the DEIS, is **unacceptable**. In the event that any of the build alternatives continue to be considered, this DEIS **MUST** be redone.

Sincerely,

Ron Bialek

GAIL BIEDSCHEID

PLEASE PLEASE DO NOT NOT ADD "TOLL" LANES RIGHT NOW to 270....THERE ARE SO MANY PEOPLE STRUGGLING JUST TO KEEP UP WITH THE MORTGAGE AND FOOD....MAYBE DOWN THE ROAD AS THINGS CHANGE...BUT THIS IS JUST NOT THE TIME AND PRAY YOU ALL CONSIDER STRUGGLES WE ARE ALL GOING THROUGH...IT WOULD BE LIKE ADDING SALT TO OUR WOUNDS>>>PLEASE DO NOT GO FORWARD WITH THIS RIGHT NOW...WE HAVE ENOUGH TO CONSIDER AND WORRY ABOUT RIGHT NOW..

Edward Bielaus

Please consider the monorail study that goes from Shady Grove metro to Frederick Md. The benefits outweigh the costs and are much better for the environment with less noise and disruption. We do not need more than 12 lanes of pavement. We do not need privately run roads in our community. There are some choke points that can be remedied with less destruction and costs.

Peter Billingsley

I oppose the I-495 and I-270 project. I support the no-build option.

My major objections to this misguided plan are economic and environmental.

This proposal is stuck in old thinking of continued growth being the fix for all things economic, yet a careful look at economic history shows that such thinking is highly flawed. It is impossible to continuously accommodate growth. Impossible. What we are seeing now, congested highways, log-jammed traffic, the resultant road degradation and pollution, are all a consequence of such outdated growth economics. It is very obvious that the response to the plan will be not only to transiently reduce travel times for commuters for a while, but also increase the numbers of travelers, resulting in slower travel times, etc. and so the vicious spiral begins again. In several years' time, be it 10, 20 or 30, if any of the alternate proposals are enacted, your successors will be undertaking the same process all over again, rather than having inherited a long-term fix. In essence, the proposal is just not radical enough. It dismisses any plans that do not have cars and roads as the central solution, and it hands over financial income to a for-profit third party. The plan should therefore better accommodate population and commuter growth in ways are less costly, have potential for incremental long-term changes, and establishes a true transport network rather than making it easier for more vehicles to enter unnecessarily into an already congested city.

The environmental impacts here are profound. While the proposal makes light of the impact by presenting percentage impacts, one should remember that once those green spaces, those trees, those water ways are taken from us, replacing them is impossible. We live in an era of climate change and climate change denial. The scientific evidence demonstrating the impact of man on the warming world is overwhelming. This proposal chooses to ignore this, couching the impact in terms of "minimal impact". This means, though, that there is indeed impact and that it will be permanent. Large parts of the proposed build(s) affect the water table that feeds into the Chesapeake bay, a stunning water body that is already over-threatened and fragile, polluted and with fisheries in periodic danger of collapse. Even the alternative 1, "No Build", still has environmental impact (and as such the study is flawed) because current infrastructure will have to deal with increasing traffic volumes. Again, I urge you, be radical. Look for alternatives that respect the environment, that not only encourage zero environmental impact but actually aim to take cars off the road.

The recent pandemic has shown that there are alternatives to how many of us can work, how this reduces the need for commuting and hence reducing traffic movement. Rather than saying that the MDOT will track trends, why aren't MD, VA and DC administrators forcing these trends? Pushing people to work more from home, making incentives for reducing traffic needs and the like would be a far more effective alternative solution.

Libby Bingham

With what happened with the Silver Spring Transit Center (shameful), the Purple Line project (debacle), a new reality of increased remote working (even post Pandemic) and all the environmental concerns raised in this report, I believe it would be irresponsible to move ahead with this project. There are many other ideas to consider that would help alleviate traffic congestion in the area. Let's get our house in order with the Purple Line before taking on another invasive, expensive and time-consuming project.

Melanie Biscoe

To Whom It May Concern,

I am opposed to the I-495 expansion for many reasons, including:

- Reduction of tree cover and open space in our parks that would reduce wildlife habitat, contribute to global warming, and reduce already limited recreation space
- Additional runoff into Sligo Creek from paved lanes, which is antithetical to anti-runoff objectives in the county and will also cost taxpayer dollars to address
- Displacement of my neighbors and reduction of housing available in the area, when there are already limited housing opportunities
- Drastic increase in noise pollution - I moved to my house to specifically be out of earshot of 495, and my mental health would be impacted with the constant noise post-expansion
- Promotion of modes of transport that rely on fossil fuels when emissions need to be curbed to combat climate change at the county and state level; it would at least be advisable to see how Transportation patterns shift after COVID, when we can utilize public transit and many may be working from home on a more regular basis.

Thank you for your consideration,
Melanie Biscoe

Subject: I support the no build option

I strongly support the no build option and strongly oppose the 495/270 expansion.

Particularly now - as we deal with monumental uncertainties and changes in our day-to-day lives due to CoVid, economic uncertainty, political upheaval, drastic changes in our workplace, commuting, traveling and shopping patterns - we need to step back from making irreversible changes and choices for a future that is sure to change, simply based on studies from a past that does not now reflect our future.
What is the point of risking so much on a study that (probably never was) and is not now viable?

There are so many concerns.

Community;

Our community will be forever and irrevocably changed by the destruction, construction, noise and pollution to come. We stand to lose homes, backyards, natural barriers, peace and privacy.
We stand to lose our neighborhood recreation center, tennis and basketball courts, playground.
We will lose our wooded wetlands which not only protect our flood-prone neighborhood but shelter wildlife: deer, foxes, birds and a place to enjoy nature and walk our dogs as well as provide a measure of relief from the incredible noise and pollution of the current Beltway.

Blair High School, which supports an economic mix of underserved students, will lose valuable playing fields and be exposed to years of construction as well as permanent greatly increased noise and air pollution.

Our entire neighboring communities will lose our YMCA with its swimming pools, playing fields, exercise facilities, day care and community gardens. This is irreplaceable.

We KNOW all of this firsthand because those of us who live in and love our thriving, diverse, friendly neighborhood put up with what is already barely acceptable noise and pollution in order to stay here.
There is no detailed plan to deal with or mitigate both the vastly increased noise and pollution we know to expect.

Business:

Our thriving neighborhood business area - a desirable model and walkable mix of small businesses and restaurants - will suffer greatly with expanded roads and traffic.

Parkland

Huge swaths of public parkland.. so precious and rare in our close-in suburbs .. will be lost forever. " Giving " us parkland in a further out part of the county does NOTHING for those of us near the Beltway. We can't walk to a nearby park. We lose animal habitat. We lose wetlands. We lose animal habitat.

It feels as though we are losing everything that makes a neighborhood great. Thus we are left with a vastly less desirable close-in neighborhood which inevitably leads to declining property values, home ownership etc. Our vibrant, multi-cultural, economically- diverse neighborhood disappears.

PPP

Other PPP models have proven that this is NOT a risk-free or even guaranteed fix to our traffic problems.

Cost overruns, conflict, taxpayer bailouts, endless construction and delays.

Purple Line problems should be a warning.

The roads are built, the 'free' lanes fill and within 5 years - according to verified studies - we are back to gridlock.

Only the rich can afford the rush hour tolls and traffic relief while it lasts.

Little consideration has been given to making the InterCounty Connector a more desirable, better used alternative to the more congested sections of the Beltway that it parallels. Built at great cost and the destruction ecological destruction of much open space, it is seriously underutilized and should be included as a viable part of any commuter improvement plan.

Taxpayer impact

In addition to the huge risk of cost overruns, mis-management, etc above... the taxpayer is going to be stuck footing the bill for costs of managing new stormwater runoff.

In sum, this risky, last -century -thinking plan is simply not what we need.

Catherine Blais,
Indian Spring 20901
40 year resident.

Slated to lose woods across the street to a construction site for many years, and then face a wall directly across from my house, with 12 lanes of traffic.

We had prepared our home and garden to age-in-place.

Sigh.

Vanessa Bliss

I am opposed to this and wish you would have not killed the redline project which would have been great for Baltimore City and the region.

Phyllis Blum

Personally & speaking for Markwood Citizens (30 homes) we DO NOT want the toll roads like Virginia into DC where tolls are excessive - we would be ok if the tolls were like the ICC tolls- we are also opposed to taking property - people who would have to relocate would have to pay MUCH MORE for a new place than their current home & do not have the funds to do so-

**STATEMENT OF ED RICH, PRESIDENT
GREATER FARMLAND CIVIC ASSOCIATION
MARYLAND DEPARTMENT OF TRANSPORTATION
I-270 & I-495 MANAGED LANE STUDY
November 3, 2020**

These comments on the Draft Environmental Impact Statement (DEIS) are submitted on behalf of the Greater Farmland Civic Association (GFCA), representing a community of 981 homes in the Old Farm, Tilden Woods, Hickory Woods, and Walnut Woods neighborhoods. From our location just south of Montrose Road and adjacent to I-270, we have had a front row seat for repeated I-270 expansions, all sold as “traffic solutions.” We have followed the current P3 program of proposed managed lanes with increasing skepticism. Having processed the hundreds and hundreds of pages of the DEIS and the Joint Federal/State Application (JPA) for impacts to wetlands, waterways and floodplains, we find our skepticism has been well founded. We share the concerns expressed by the Maryland National Capital Park and Planning Commission (M-NCPPC) in their October 19, 2020 rejection of the plan and by many members of the Maryland General Assembly in their letter of September 23, 2020, to Lisa Choplin, the Director of this project for the Maryland Department of Transportation’s State Highway Administration (MDOT-SWA). The financial risks of the P3 structure; the ecological, social, and cultural sacrifices necessary; and the proposed 50-year term of the contract which substantially limits how we will meet future needs—each of these, in our view, is a deal-breaker. We also question the numerous assumptions and guesses made in forecasting future traffic demand, in predicting motorist behavior, and in determining air quality. Our rejection of the P3 program and its alternatives, however, is ultimately based on the flawed goal of the project: to create additional roadway capacity to carry more cars (Executive Summary, 4-10). Not only will a project focused on a simplistic solution to a complex issue fail to alleviate traffic congestion, but it will

further degrade our environment and propel climate change at a sensitive period of time when urgent action is required.

Previous expansions of I-270 and of highways across the country have repeatedly shown that increasing roadway capacity for cars to drive at speed is at best a temporary solution and ultimately self-defeating. At a July 2018 gathering of the American Association of State Highway and Transportation Officials, Roger Millar, the director of the Washington Department of Transportation, stated that the underlying cause of traffic congestion is not insufficient road infrastructure but the lack of “affordable housing and transportation solutions” that would encourage persons to live closer to their jobs. As Brian Woods so eloquently stated, “By accommodating people before cars and reducing the number of road projects, driving doesn’t become the default option. That leads to fewer cars on the road. These options work best together: reducing reliance on automobiles by changing the built environment while simultaneously making transit, walking, and bicycling more convenient and affordable.” The solution is clearly more emphasis on telecommuting, off-peak commuting and alternatives to the single occupancy vehicle for getting around. But the P3 project focuses exclusively on roadway expansion, thereby ensuring that the future will be a roadway full of more cars traveling at slower speeds and an increasingly negative impact on our climate and quality of life. Smart Growth is designed to get cars off the road. Getting cars off the road is the key expressed goal of Visualize 2045 and of Montgomery County’s I-270 Corridor Forward initiative. It should be the goal of Maryland in considering how to handle the traffic congestion of today and of tomorrow on I-270 and I-495.

Maryland, in fact, has ambitious goals with respect to emissions, but the DEIS makes clear the P3 project is unlikely to help achieve them. The Maryland Draft Plan to Achieve

Climate Goals (October 15, 2019) states that transportation accounted for 40% of Maryland’s gross greenhouse gas (GHG) emissions in 2017. It is hard to see how the P3 will help accomplish the reduction of emissions when, as Chapter 3 of the DEIS specifies, the I-270 managed lanes in 2040 will support an average daily traffic of more than 300,000 cars. The few P3 alternatives which retain HOV lanes would operate at HOV-3, and nowhere is there a provision for approved plug-in EVs to use the HOV or HOT lanes even if they are traveling solo, as is provided in the Clean Cars Act of 2017. While the DEIS bases projections of air quality on projections of future car efficiency, the Climate Goals report admits that challenges to lowering GHG emissions include the EPA’s rolling back rules to earlier, lesser standards for fuel economy. The Climate Goals draft plan also states that public transportation “emits roughly 40% to 50% less GHG emissions per passenger mile than an average single occupancy vehicle,” and calls for expanded investment in public transit—a position extremely limited in the P3 program, which has dismissed transit-only alternatives. According to the DEIS Executive Summary, the P3 agreements will provide for “specific transit investment,” and mentions two particulars: allowing BRT to ride free on the managed lanes, and building a ramp on I-270 to the Montgomery Mall Transit Center. In fact, the DEIS presents no comprehensive plan to develop an accessible and reliable Bus Rapid Transit (BRT) system. It refers us to the Transit Service Coordination Report, released in June 2020, which lauds the managed lanes as an “opportunity to create a suburban transit network that is a time competitive alternative to driving.” This report posits “new transit centers” and “new transit services” to support an “underserved transit market” of nineteen to twenty-two thousand commuters who currently drive between Montgomery County and Fairfax County. The report fails to provide details or a plan to actually develop these services, however, and admits that there is no money to do so.

With transit-only alternatives dismissed and providing no actual commitment to BRT, the DEIS' boast that the project aligns with Visualize 2045 is all the more objectionable. The writers are guilty of cherry-picking here. Visualize 2045 clearly states that its goal is to get cars off the road, and six out of seven points advocate car-less options, including transit such as BRT and rail. Far from aligning with Visualize 2045, the project as made clear by the DEIS is all about the car—about its convenience and the revenue that the project planners and advocates expect to generate from it.

The P3's goal of enabling substantially more cars on the road is an overly simplistic response to growth that, far from "free" as Governor Hogan touts this scheme, comes at too high a price, both in taxpayer dollars and damage to the environment. And for what? The DEIS clarifies that the managed lanes, to be built at a high cost to the environment and those who live in it, will save commuters less than 10 minutes during a peak-time trip. Table ES-2 indicates that "system-wide delay savings" for motorists range from 33% to 35%. Like good marketing, this figure sounds compelling until one reads in Chapter 3 that the system-wide delay savings of 33% in the PM peak for Alternative 9 in 2040 equates to 7.9 minutes saved. Considering what is lost to build the new managed lanes, these few minutes come at a price much higher than the money to build them or the money earned from them. This includes the loss of an Early Woodland archeological site near the river, the loss of the historic Moses Hall Cemetery, and the significant degradation of the Glenarden historic African-American community. The DEIS dismisses the importance of the slender habitat of trees along the road, but the wildlife living there will be forced into isolated and small tracts that cannot adequately support them. The law requires trees removed from parkland to be replaced 1:1; however, it is unclear where the replanting will happen. And the list goes on.

In Chapter 4, section 24, the DEIS considers the “irreversible and irretrievable commitment of resources,” including the “irreversible dedication of land to transport use.” The P3 contract would be for 50 years. It is disingenuous at best for the writers to say, “if a greater need arises for the land or if the transport facility is no longer needed, the land can be converted to another use.” How would the contract be voided to provide space for transit, should transit become essential in a near-future world heavily affected by a climate change driven by car GHG emissions? The DEIS confirms for us that the cost of building four extra lanes on the highways is too high for what we in fact get. We get an expensive set of toll lanes that keep drivers in their cars, living far from work, paying high tolls, and sending lots of greenhouse gases into the air. We get impoverished ecosystems and diminished communities and quality of life along the highway. We sign over control of a key portion of land that might be used instead for rail or other transit alternatives to a for-profit private company for 50 years, a period of time that scientists acknowledge to be the most critical for fighting climate change. And in exchange, some commuters may, for a few precious years, save a few minutes on their commutes and some local entities and the state get some money for other things (which, if the Purple Line debacle is any indication, is a pipedream). It is a bad bargain.

This P3 Managed Lanes study should be scrapped before too many more precious tax dollars are spent on an approach that is doomed to failure and that will have a significantly negative effect on the quality of life in our neighborhood, our county and our state.

Subject: Draft EIS for 270/495 expansion is inadequate

Lisa Choplin,

I reviewed dozens of DEISs and EISs during my 42 year government career. One thing I learned - sheer size doesn't matter, especially if the original proposal is flawed.

This proposed highway expansion is just that - flawed. Perhaps most of all for the social justice issues it fails to adequately address, and for the assumption that commuting patterns will quickly return to normal once the pandemic is finally behind us. But, there's a strong probability that now that thousands and thousands of Marylanders have experienced teleworking, they won't want to go back to the previous model. And, it's equally likely that many companies will see increased benefits and decreased costs from a mostly remote model. Rather, we should be developing better mass transit options for those of us who cannot work from home - the very same people who have valiantly kept us and our essential services large;y afloat during these challenging times. THAT's where these billions of dollars should be invested.

L. Boice

Name: Margaret Boles

Date/Hearing: 8/25/20

Type/Session: Live/Morning

Transcription:

My name is Margaret Boles. I reside at [REDACTED] Cleary Lane in Mitchellville within sight of the noise, noise wall for Route 50. I'm firmly opposed to this project and I am for the No Build option. After several days of going over the Environmental Impact Statement, I found that this plan will impact many low-income home, homeowners in Prince George's County. Over 1,500 homes will be subject to increased air, water, and soil contamination because of the increase in nitrous oxide and greenhouse gases and water runoff. Over 30 miles of local streams will be negatively impact, along with 86 acres of national forest, and 1,500 acres of woodlands that clean our air and filter our water. This is yet another environmental justice issue that unequally effects our black, brown, and low-income neighbors' health and safety with no appreciable benefit to them. I respect the efforts of the environmental team but find this is a very flawed document. Just a quick perusal of the wetlands and Waterways, Waterways Impact Plates showed much disturbance both in Paint Branch Creek area, Greenbelt, New Carrollton and Route 50 interchanges, and Branch Avenue. Maps 28 to 40 and document Tables - page 4; 107; 108 are my reference for that. Also Maps 140 to 159 in the Environmental Resource Mapping document show detrimental effects in these regions, as did Table 4-33 and page 4-94 to 97. We've seen the effect of less traffic during COVID shutdowns: cleaner air, clearer skies, safer roadways and walkways. The percentage of traffic was off, was off the road. Increased numbers of people learned to work from home and that is what made the difference. I think that if we feel that this is going to have no cost to the State – that's the taxpayers - then we are dreamers and we have not been reading papers of how P3s has affected other states and our own.

We need to move forward and think seriously of other ways of addressing public transit and climate change that will not exasperate, exacerbate the one, and give service to a few people who will not suffer the consequences of this building project. Voting No Build alternative. Thank you.

Testimony for Joint Public Hearings for the Draft Environmental Impact Statement
for the Addition of Toll Lanes to I-495 and I-270

Maryland Highway Planning

Greetings MDOT staff and officials,

My name is Margaret Boles, I reside at [REDACTED] Cleary Lane, Mitchellville, MD 20721 within site of the noise wall of Route 50. I firmly oppose this project and am for the NO BUILD option. After several days of going over the Environmental Impact Statement I found that this plan will impact the homes of many low income home owners in Prince George's Counties; over 1500 home will be subject to increased air, water and soil contamination because of the increase in nitrous oxide and greenhouse gases and water run-off; over 30 miles of local streams will be negatively impacted along with 86+ acres of National Forest and 1500+ acres of woodlands which clean our air and filter our water. This is yet another **Environmental Justice issue** that unequally affects our Black, Brown and low income neighbors' health and safety with no appreciable benefit to them. I respect the efforts of the environmental team, but find this to be a very flawed document. Just a quick perusal of the **Wetlands and Waterways Impact Plates** showed much disturbance both in the Paint Branch Creek area, throughout Greenbelt, the area around the New Carrollton and Route 50 interchanges, and down in the Branch Ave. area(Maps 28-40)(document tables p.4-107 and 108). Maps 140-159 in the **Environmental Resource Mapping document** also show detrimental effects on these regions, as did tables 4-33 and p. 4-94 to 97. We have seen the effect of less traffic during the Covid 19 shutdowns: cleaner air, clearer skies, safer roads and walkways. The percentage of traffic that was off the roads as increased numbers of people learned to work from home made that difference. If we would put on our 21st century thinking caps and not stay stuck in 20th century thinking, Eisenhower, we could come up with some better plans that would give advantages to people of lower incomes who need to ride the buses and rapid transit.

While the trailer hours are very limited and the access of documents in line did give the non-engineering public some opportunities to get a quick view of the some of the 18,000 pages of this study, it surely did not provide the kind of education

one would need to be knowledgeable about all of the impacts of this wrong approach to alleviating our traffic problems.

Lastly, if we think that this will not cost the state and thus the taxpayers anything, we are dreamers and we have not been reading the papers about how P3's have affected other states, and our very own Purple Line construction. We need to move forward and think seriously of other ways to address public transit and Climate Change that will not exacerbate the one to give service to the few who will not suffer the consequences of building this project. I vote NO BUILD, ALTERNATIVE ONE.

Olivia Bonnette

Don't expand the highway it's very bad for pollution, including noise and light pollution. Shrink the highway it's already too big and causing lots of problems

Thanks

Olivia

JOAN BOROS

My comments are the product of careful researching over the many months that the I-495 and I-270 project has been pending and the DEIS has been available. The material and professional studies have been submitted by the entities so my comments will be concise conclusions.

1. Contrary to the environmental views and goals of Maryland and Montgomery County by increasing the water and air pollution and increasing global warming gases.
2. Destroys about 1500 acres of the essential forest canopy.
3. Intrudes on innumerable parks.
4. Contributes to the already ecologically rush hour troubled main avenues - Wisconsin Ave., Connecticut Ave., and Georgia Ave. to name just three. This is in addition to impact on I-270.
5. Adversely economically and environmentally affects countless houses with pollution and noise during and after years of construction.
6. Destroys about 40 houses.
7. Adversely effects WSSC's water supply system
8. Creates a substantial risk of taxpayers' future responsibility.
9. Relies on a questionable need and use for Luxury Lanes.
10. Inconsistent with the long term impact and recovery needs generated by the pandemic.

ABANDON THE PROJECT

Yuri Borovsky

Dear PPP team of MDOT,

I would like to express my concern as to how opaque the process is. It is a process that is impossible to follow despite the pretension by the MDOT to be transparent described below:

I receive two copies of the mailer (both in my name and what a waste of paper) that is not clear about where we are with any of the previously proposed alignments.

There was a poor chap, staged as a local USPS office (in the midst of the pandemic and Hogan-mandated quarantine) with a project binder that could kill an elderly both trying to read it through all of it or if thrown at one. Who does that? Perhaps an organizations that wants to overwhelm the stakeholders that's who.

Your website, sleek and modern and useless (well, not so useless since I can pen in this form no-one will read) impossible to figure out the project details.

Bottom line: Which alignments are making the next cut and why? I am closely following this process ad don't know because MDOT is not clear about it.

Best regards,
Yuri Borovsky

Kristina Borrer

I am against beltway expansion because:

- MD should be supporting cost-effective, affordable transportation for all commuters, not expensive "luxury lanes" for the rich.
- Although CO2 pollution from cars and trucks is one of the primary drivers of climate change and has already caused millions of deaths, the DEIS does not take account of this future impact.
- The financing for the project does not include costs for required water and sewer infrastructure and for mitigating environmental degradation.
- Widening the highways would destroy many homes and small businesses and hundreds of acres of parklands.

Ethan Bowen

Our continued focus on expansion of interstates in the region is short sighted. As the region grows we will never support all the cars we want to support. It's just not realistic.

You should investigate spending the money on transit like BRT or other things that could have a much greater impact.

Re: I-495/I-270 Managed Lanes Study Draft Environmental Impact Statement Comment

Dear Secretary Slater:

As a Prince George's County resident who lives in the Suitland area I am very concerned about the financial and health impacts of an expanded I-495. My community is already deprived of many of the amenities of other parts of the state. Just a few years ago, a swath of trees that had provided beauty and cooling to my 98% concrete neighborhood were mowed down for apartment buildings. I was told an equal number of trees would be planted elsewhere. Where those trees are I still do not know. It is time that Governor Hogan and other officials give Prince George's a break. We do not need any additional projects that will increase noise, impact limited green spaces and subject our neighborhoods and kids to the admittedly not fully studied impacts on air quality in my predominantly African-American community.

At a time when so many are stressed, why does Governor Hogan want to bring greater stress. We need more green spaces, less noise and more studies of the environmental impact on already hurting Black and Brown communities. The impacts of on many levels of this expansion have not be fully studied. That needs to be the focus rather than ramming unnecessary expansion through.

Also, as COVID has resulted in many workers working from home, the need to address any congestion has significantly decreased. This all begs the question of who these "luxury lanes" will actually benefit because it won't be any one in my neighborhood.

Sincerely,
Tanara Bowie

Subject: Fwd: Comments on DEIS for I-495 and I-270 Managed Lanes Study

I am a resident/property owner in a neighborhood directly adjacent to I-270 and near I-495. I do not have expertise or resources to fully review and provide technical comments on the massive, complex DEIS. My comments therefore consist of 1) a link to information on Yale University research on non-combustion-related sources of chemical emissions from asphalt that should be taken into account in the air quality analysis, and 2) my own limited comments.

1) The link below provides information on a recent study by Yale University researchers which found that chemical emissions from asphalt in roads are a significant source of air pollutants, especially on hot and sunny days. Since the new lanes would add large amounts of asphalt paving, I urge that this study be included in the EIS's air quality analysis.

2) The new managed HOT and ETL "Lexus" toll lanes would benefit well-to-do people who can afford to pay tolls repeatedly, and the private "Developer." The environment and the general public — especially the thousands of people who live and/or own property near I-270 and I-495 — would bear the devastating, exorbitant costs of the proposed P3 project, including:

- major environmental and property damage;
- destruction of parkland and other permeable green spaces, including forested screening/buffer between the highways and homes — and loss of environmental benefits and physical and psychological recreational benefits these green spaces provide;
- significant increases in air pollution, noise, and stormwater runoff;
- seizure of private yards, homes, and businesses; and
- significant decrease in quality of life and loss of property values near the highways.

I am disappointed that Alternative 10 — which apparently would have the widest footprint and would cause the most damage affecting my neighborhood — has been retained.

Among preferable alternatives are:

- improving public transit;
- adding well-planned non-toll lanes, such as reversible lanes, within the existing highway footprints;
- using the Intercounty Connector (MD 200) to divert traffic;
- curbing up-zoning of Montgomery County property and stopping excessive population growth (and related increased traffic); and
- adding more parkland, not destroying existing parkland.

Subject: I support the NO BUILD OPTION

From Laura Boyer, Silver Spring, Maryland 20901

The plan to expand the Beltway and 270 is a very, very bad idea.

It is bad when looked at from almost any angle. Bad for the public, bad for the environment, bad for our communities, bad for Maryland's financial well-being, and indicators show us that it would be bad for Transurban. Because unless commuters are driven to desperation by severe congestion (or unless they are rich and don't mind a little extortion), they won't feel forced to use Transurban's toll lanes, which is what the Australian Corporation counts on to make its profits.

It was a bad idea before the Corona Virus, now it makes even less sense. People have shifted to telecommuting, and are likely to stay in that mode after Corona. Telecommuting is a time saver, and a money saver for workers and employers alike. It is likely to stay, and in any case, wouldn't it be smarter to wait and see?

It is a bad idea in that it is a waste of fossil fuel to drive a car if it is not needed to get to work. Please tell me where the DEIS analyzes this bad idea's impact on climate change.

Make no mistake, this is about not making a mistake. A very, very bad one.

Again, I support the no-build option

Do not build this project. I strongly oppose it.

Will worsen rush hour on i-270 north
Will impact 1500 homes and destroy 34
Will increase air and water pollution
Will cause 4-5 years of construction misery
Invade dozens of parks
Destroy nearly 1500 acres of forest canopy
Put taxpayers at risk for years

This project is un-needed given the radical shift in telecommuting and reduced traffic with COVID-19 that will continue in to the future
We don't need Luxury Lanes on I 270. We already have HOV lanes. Re-examine the data used to justify this project using current information.

William Boykin

Cecile Brach

I object to the plans to widen 495 and 270. I live in Silver Spring and work in Rockville and commute this route and would stand to gain from reducing congestion. However, I think this whole study was premised on the assumption that building roads was the best way to improve the quality of life of those of us who use them. The DOT should be exploring alternatives such as increasing telecommuting (which we've now proven is very viable) and greener transportation alternatives. Furthermore, I object to the ceding of a governmental function to a private developer. By definition a developer is only going to be interested in this project if it can make money. That is money coming from the taxpayers that are commuting on the roads - so we're not only paying for the roads, we're also paying for the developer's profits. I am affronted by the assertion that this is "no cost" to Marylanders. It would make much more sense to levy a larger fee on car registration to pay for the cost of road maintenance. But rather than risk being accused of raising taxes, you'd rather let us pay more to a developer. The "alternatives" are all shades of the proposition, and getting "public input" into them does not allow the public to express its support for other options that haven't been put on the table.

Oct. 17, 2020

Dear Ms. Choplin,

Hope you are doing well and staying safe during this difficult time.

We are writing to express our opposition to the widening of I 270 and 495, this is not the solution to the problem of traffic congestion.

We believe in a solution that eases the congestion and protects our environment, and preserves the homes that will be destroyed, and prevents the excessive commercial development that will certainly spring from this proposal. All of these costs seem far greater than the limited - short term - benefits this proposal promises. Widening I 270 and 495, will not solve the traffic problem.

We support a solution that does not contribute to global warming and air pollution, preserves homes and neighborhoods, while offering methods of transportation: like rapid transit buses, dedicated bicycle lanes, and tele-commuting, and walkable communities.

Thank You for your attention to our concerns,

Sincerely,

Lisa and Dennis Braden -
westend Rockville MD

Jessica Braider

I would like to express my opposition to the expansion of both 495 and 270. This is a short-sighted and environmentally irresponsible solution to the problem of congestion. Time and time again we have seen that when roadways expand the congestion is not improved, instead more cars fill the roadways. Instead we should focus on investing in public transit solutions to the congestion.

In addition, with the onset of the pandemic, we have seen that there are many jobs that can be successfully completed by working from home and many companies are already discussing shifting their work forces to work from home. This will very likely have an impact on congestion.

So I beg you to focus on mass transit, see how things change as more people continue to work from home, and protect our environment for future generations.

Name: Elizabeth Brandt

Date/Hearing: 8/25/20

Type/Session: Live/Morning

Transcription:

Hi, my name's Elizabeth Brandt. And, I'm so sorry. I think when you were calling Christy Taylor before, that was my other phone. So, so this is Elizabeth Brandt. [FACILITATOR SPEAKS]. Oh sure. No, of course. Sorry for the confusion. My address is [REDACTED] Grubb Road, Chevy Chase, Maryland, and I'm a member of Moms Clean Air Force and a Field Manager for that organization as well. And I'm concerned because I use transit and drive and walk in the areas that you would expect commuters coming off of the 270 expansion and the Beltway to use and I find those areas to be actually very dangerous at this point and I'm very very concerned about having additional traffic on roads like Connecticut Avenue where my daughter goes to preschool. We typically take the bus to her preschool and I walk to the Metro in Bethesda. It's about a mile away. I have to cross Connecticut Avenue several times on foot to make all of this happen and I've nearly been hit more times than I can count. I have completely stopped using crosswalks that don't have traffic lights and even still, people drive on these streets as if they are part of the Interstate. And, particularly since we are going to a preschool that is right on Connecticut Avenue, that's very concerning to me as a parent.

In addition to the pedestrian challenges that I'm concerned that this may present from my neighborhood and neighborhoods all around the Beltway. I'm concerned about the air quality and the climate impacts of expanding our highway system. Already 88 percent of people in Maryland live in counties that are in non-attainment of air quality standards set by the EPA. This can only exacerbate that problem. I feel as a parent that we have to be watching out for the air quality that causes asthma problems, heart problems, can contribute to cancer, and now at this point, air quality problems that may be contributing to Coronavirus. And I'm concerned that this, this plan puts commuters ahead of the needs of our families in multiple ways. So, I really appreciate your patience and your interest in listening today. And, and I thank you so much for your time.

Nancy Breen

The Rockville Bicycle Advisory Committee opposes the I-495 and I-270 widening project. We support the no build option. The proposed widening project would have significant deleterious impacts on the environment that the draft Environmental Impact Statement fails to take into account. In addition, its rationale is now outdated.

The construction period would present a major barrier to biking and walking in Rockville and beyond. Widening the interstate from 12 to 16 lanes could block the use of at least six bridges in Rockville, including a dedicated bike-only bridge. Having these bridges unavailable would compel bicyclists to cycle miles out of their way, making their trips less safe and less convenient. It would predictably reduce cycling and increase pollution from increased car traffic.

In the long term, expanding I-270 could have major negative impacts on bicycle safety and usage, which the draft EIS does not take into account. Adding exits at Gude Drive, blocking the Friendship Bridge, or interrupting Montrose Road would negatively impact bicycling routes for transportation and recreation throughout Rockville. I-270 already divides the city, making it difficult to walk and bike between key locations. The Rockville Bicycle Advisory Committee has worked with the city of Rockville to reconnect these areas. The proposed widening project threatens to disrupt these efforts.

Most importantly, there is now much less need to expand the highway. The COVID-19 pandemic has demonstrated the strengths and potential for extensive telecommuting. Numerous firms and agencies that previously did not encourage remote work from home have been able to adjust. It appears very likely that the number of telecommuters will remain high in the future as employers reduce costs related to office use by expanding telecommuting. Bicycling and walking have also increased during the pandemic. Although it was at first for exercise and recreation, increasing numbers of people are walking and biking for transportation. Both of these trends will reduce the use of automobiles and increase the need to support sustainable transportation. In short, our area is moving away from single-car use. Our policies and construction plans must reflect these changing priorities.

In conclusion, the plan to widen I-270 did not sufficiently consider the complete transportation environment or the environmental impact on Watts Branch. Recent events also appear to have rendered the plan out of date. Widening I-270 is costly and not necessary. Moving forward with widening I-270 would have widespread negative impacts for the City of Rockville, especially on more sustainable forms of transportation.

Sincerely,
Nancy Breen, Chair
Rockville Bicycle Advisory Committee

Subject: Strongly Against Proposal to Add Lanes to I-270 or I-495

Good afternoon,

I am a long-time resident of Rockville, MD, and I am writing to strongly state that I am against the proposal to add lanes to I-270 and I-495. I believe that added lanes will lead to greater traffic and congestion and have a very negative impact on the environment and the quality of life for residents of the cities near these two major highways. And I certainly do not think the project is economically feasible—especially given the pandemic, which has contributed to a decline in traffic. A much better use of taxpayer money would be further investment in public transportation and support for telecommuting.

Thank you,

Linda Brenner

I oppose this project and support the NO-BUILD option.

Anton Briggs

I oppose this project and support the NO-BUILD option. Increasing car usage is not a viable option to alleviating traffic. All efforts should be directed to finding environmentally sound and sustainable solutions to improving public transportation. When given the option, commuters will choose convenient, safe, and efficient public transport in lieu of inefficient and fundamentally unsafe travel by car. It is the responsibility of our government to provide good public transport.

Subject: Comment on the I-495/I-270 Draft Environmental Impact Statement

Hi,

I oppose this project and support the NO-BUILD option. I oppose widening I-495 and/or I-270 ("495/270"). During this time of climate crisis, it is the wrong time to encourage the use of private vehicles, including expanding highway capacity. Maryland should focus all its transportation resources on expanding and encouraging public transportation.

I live in a house I own two blocks from Montgomery College, near the I-270 interchange with Route 28. I am close enough to I-270 to hear the drone of its traffic. I am proud of my neighborhood and do not want to see its amenities (plan, parks, moderate traffic level) destroyed by widening the highway. Route 28 is already heavily congested and the metered access to I-270 that is being installed will push more stalled traffic into the neighborhood, lowering the quality of life and adversely affecting Montgomery College students, staff, and faculty who use I-270. When in session, Montgomery College traffic is already heavy periodically throughout the day.

I am a professional epidemiologist with **expertise in the effects of the environment on health**. I am also a **tax-paying voter**.

Even if it were true that private vehicles do not contribute to adverse environmental impacts, **there are many problems with the current plans and alternatives** for 495/270, and the current DEIS is inadequate:

- I have observed that when HOV lanes are in effect, the neighboring lanes are much more congested. The same thing will happen, maybe moreso, if a lane is dedicated to tolls. Increased traffic in the free lanes will increase congestion on local alternate roads. The increased congestion will increase the disadvantages of the current situation:
 - - more pollution from fossil fuel vehicles moving at slow speed. This pollution:
 - -- directly increases asthma rates among children. It is not ok to knowingly threaten the health of our children, whom we are charged to value and who are our future fellow voters.
 - -- increases the severity of other lung diseases among everyone who is exposed, thus increasing healthcare costs and shortening lives.
 - -- poisons the soil. If people eat plants grown in it anyway, their health suffers.
 - -- smells bad, thus reducing quality of life for the people who live nearby.
 - - more resident and rider irritation due to increased traffic and noise, leading to stress-related mental- and physical ill health.
 - - higher healthcare costs due to the above points. They are already high and Maryland can ill afford an increase in public and private healthcare costs.
- Increasing 495/270 will negatively impact neighboring green spaces and parks:
 - - Trees will be removed on over 1400 acres. We need those trees to mitigate the climate crisis by:
 - -- cooling the local area.
 - -- removing carbon from the air, which we know will increase with more cars on the road.
 - -- absorbing rain in increasingly severe storms.
 - - The increased run-off due to more pavement will threaten to reverse decades of efforts to clean up streams (including recent work to my neighborhood stream) that feed the Chesapeake Bay. The Bay is a major economic resource (fishing and recreation) for Maryland. Buying up streams in other parts of Maryland will do nothing to mitigate the damage from 495/270 to nearby streams and downstream waterways.
 - - The increased run-off will increase the risk of flooding the streams and thus destroying downstream wetlands. Those wetlands are crucial to mitigating damage from storms by protecting the coast and inland. The climate crisis is causing increasing numbers and severity of storms, so we need buffering wetlands more than ever.
 - - Green space buffers between 495/270 and neighboring parks and homes will be reduced, thus reducing the:
 - -- quality of life for residents
 - -- property values (thus reducing government revenues)
 - -- quality of parks for human visitors and wildlife.
- Taxpayers, including me, will pay more to expand 495/270.

- - At least \$1 billion is already in the plan.
- - WSSC estimates it will have to raise \$2 billion in extra fees to move water and sewer lines.
- - There is no safeguard against the private party incurring costs that we the taxpayers will have to bail out.

The State's efforts to reduce congestion **may be moot**; let's wait and see rather than rush to implement the project. Even if public transportation is not increased, congestion on 495/270 will likely stay decreased even after the pandemic ends. Many employers and staff have realized that commuting is no longer necessary for their productivity and will be reluctant to resume commuting as much as they had before the pandemic. Most work in this area can be done remotely.

In sum, I'm against paying (taxes, ill health, ruined air and water, poorer quality of life, reduced property value, reduced climate crisis resilience) to expand 495/270 to, in essence, cater to the few private vehicle riders who don't mind paying \$50 for a quicker trip. The rest of us think that toll is absurd and reflects how much this administration is out of touch with average Marylanders. If that price is what it takes to pay for the expansion, that should be a message that the project is not worth the costs, many of which aren't reflected in the toll price.

I close with a repeat of **my number one priority objection**: encouraging fossil fuel use throws good money after bad by making the climate crisis worse and prevents the use of that money for improving public transportation infrastructure. The climate crisis is upon us and we need to move Maryland away from fossil fuels as fast as possible to avoid major damage over the next decades. Norway is doing it; we can too.

Sincerely,
Roselie A. Bright, Sc.D.

The historic Moses Morningstar cemetery, located between the present I-495 alignment and Seven Locks Road, is threatened by the draft plan. As one of the very few vestiges of the Black community that grew in this area after the Civil War, the cemetery should be protected. Another Black cemetery off nearby River Road was callously destroyed, and the church adjacent to Moses Morningstar has fallen on hard times. Please do not take any portion of this last remnant of such a historically important community.

Subject: Draft Environmental Impact Statement for I-495/I-270 Tollway Expansion

My name is Mark Brochman, and I live at [REDACTED] Roanoke Ave, in Takoma Park. I am against the I-495/I-270 Luxury Lane P3 Expansion, and I support the no-build alternative for two reasons:

First, we need our local parks more than ever. I frequent Greenbelt Park, Rock Creek Stream Valley Parks, and the many others (86 total acres) that would be negatively affected or destroyed. This project will not benefit our local communities, and will only hurt them, and all so some people who don't even live in our area, "might" have a shorter commute? No way.

Secondly, this project will cost up to 1 billion in state subsidies. We do NOT NEED THIS PROJECT, and we CAN'T AFFORD IT!

Thank you,

Mark Brochman

I do not believe the environmental impacts are worth the tradeoff. Please choose the no build option. The purple line disaster makes clear that the PPPs do not work in these instances and are not in the best interest of the taxpayer.

Gayle Brooks

Please DO NOT widen 270/495 with luxury lanes. It will make traffic worse. It will disrupt too many homes and families. It will negatively impact the environment by destroying tree canopies, parks, air, and water. It will impact residents' pocketbooks. Learn from the unused luxury lanes in Virginia and their impact on the remaining, overcrowded lanes

On Jul 10, 2020, at 9:04 AM, MDOT SHA P3 Program <495-270-p3@mdot.maryland.gov> wrote:

Greetings.

The Federal Highway Administration (FHWA) and the Maryland Department of Transportation State Highway Administration (MDOT SHA) have completed the Draft Environmental Impact Statement (DEIS) and Draft Section 4(f) Evaluation for the Managed Lanes Study, with the Notice of Availability published in the Federal Register on July 10, 2020. The DEIS includes traffic, environmental, engineering and financial analyses of the Build Alternatives and the No Build Alternative. This DEIS provides an opportunity for the public, interest groups and other agencies to review and provide comment on the proposed federal action and the adverse and beneficial environmental impacts and proposed mitigation for unavoidable impacts.

FHWA, MDOT SHA, and the Maryland Department of the Environment (MDE) will conduct six Joint Public Hearings. The U.S. Army Corps of Engineers (USACE) will participate in one hearing on August 25 to meet the Department of the Army requirements. Comments will also be accepted on the Joint Federal/State Application (JPA) for the Alteration of Any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland. USACE is responsible for reviewing the JPA per the Clean Water Act, Section 404(b)(1) and MDE is responsible for reviewing the Application per Environment Article §5-503 and §5-906, Annotated Code of Maryland.

Public and agency comments on the DEIS and JPA will be accepted between July 10 and October 8, 2020.

[Provide Feedback on the DEIS and JPA](#)

James Brown

As a nearly 30 year property owner and Montgomery County taxpayer, this project is absurd. The fact that you are considering removing homes, damaging the limited parks that surround this area, and trying to satisfy a flawed idea of increased congestion is truly a lack of reality. This is not necessary and yet another example as to how the governments around this area operate. They are not here to serve the interests of the tax paying citizens, they are merely serving their own agenda and perceived personal needs. Rather than "widening" roads, why don't you spend the money in FIXING the current roads and highways. There is a reason why the population in the area is declining. Poor management, extraordinarily antiquated tax structures, inefficient fiscal decisions, and complete incompetence. This project is as bad as the "Purple Line" concept. Spend your time developing plans to allow the residents of these jurisdictions to provide a decent quality of life for their families rather than taxing them to a point whereby they leave the area. This is the worst example of poor decisions, which continues to exceed my expectations every year for the last 30 years of owning MC property. Once again, ignoring more basic governing issues to create unnecessary chaos in the lives of the current residents. Terrible idea, terrible plan, driven by self serving individuals.

Hi, my name is Lauren Brown (L-A-U-R-E-N). Brown like the color and I, I live, [REDACTED] Glenmoor Drive, Chevy Chase, Maryland, and I've lived here my whole life. Ok, so I believe that the proposed I-495 & I-270 Beltway expansion Draft Environmental Impact Statement, DEIS, presents incomplete and inadequate analysis. The project will not be good for Maryland citizens and will cause harm to the environment. I support the No Build option. Instead of spending between \$482 to \$1 billion on state subsidies, we should be focusing on improving mass transit and public transportation like the Purple Line. There is not enough analysis on how the highway expansions will impact the environment, especially stormwater runoff and local waterways. We need a more appropriate analysis of how this expansion will pollute waterways and wetlands and how we can protect against these negative impacts.

The agencies plan to rely on water quality trading credits purchased from other MDOT SHA programs to meet permitting requirements instead of reducing water pollution where the project is located. Importantly, on-site and localized mitigation must be considered when addressing impacts to waterways and parklands. Also, the DEIS does not adequately show that there's no practical, practical, alternative with less severe impacts to wetlands and streams than the proposed expansion. Also, the DEIS does not do a good enough job of analyzing how the construction and footprint of the proposed expansion would increase flood risks because it may change the hydraulic function and elevation of floodplains. Also, very seriously, the proposed expansion will result in a lot of air pollution. We all know with fossil fuels and increasing that, so things like fine particulate matter, carbon monoxide, ozone, nitrogen dioxide, and all kinds of green gas emissions. The No Build Alternative, or the public transit alternative, will protect against these air pollutions, and as opposed to the expanded highway plan. So, just overall, the proposed expansion will further exacerbate climate change and impede Maryland's ability to reduce its greenhouse gas emissions by 40 percent by 2030, which is what we are pledged to do under the Maryland Greenhouse Gas Reduction Act. So rather than going forward with public [inaudible]. Thank you for your time. [FACILITATOR SPEAKS]. Yeah yeah-all right. Anyways, so the proposed highway expansion is not good for public health, especially those living close by the highway like me. I actually have [inaudible] right behind my, my next-door neighbor's backyard. So, these air pollutants - car emissions - are very harmful to Maryland citizens. This kind of fine particulate matter has been shown to cause all kinds of public health problems - from lung cancer, to cardiovascular, nervous system, and even mortality. That's even when the levels are below the national ambient air quality standards, but I just feel that- [FACILITATOR SPEAKS] Okay. I just I feel that the DEIS ignores these harms and completely fails to take a hard look at the impacts and they need to do more studies. Thank you for your time. I hope we can find public transit options that will be a much better alternative for Maryland. Thank you.

Lauren Brown

My name is Lauren Brown and I am testifying as an individual. I live in Chevy Chase, MD. The current Beltway is right behind the houses on my street (Glenmoor Drive, Chevy Chase, MD). As a resident living right next to the highway, increased air pollution could be a public health problem for me and others living in the North Chevy Chase community. I am currently a student in a masters' program at University of Maryland and John Hopkins, studying public health and social work. I studied environmental policy in my undergraduate and am a volunteer for many environmental advocacy groups. I am on the board for Conservation Montgomery. I strongly support the no-build option.

Due to COVID, many organizations are learning how to better organize teleworking from home, reducing the need for beltway expansion. We should recognize the effect of increasing work from home on transportation models. Teleworking may become more popular even after the worst of COVID is over. We need to consider these powerful trends.

We need to work towards smart growth and not increase sprawl. We should be providing access for citizens to use public transportation, rather than encouraging beltway use which will increase greenhouse gas emissions. Transit alternatives should be included in the DEIS, such as rail and public transportation. The air quality section needs to address environmental justice and communities that are disproportionately affected by increases in pollution. There is an issue with beltway expansion going through a historic African American cemetery. The DEIS needs to provide a full environmental justice review.

The expansion of the beltway would add 550 acres of impervious surfaces to the area. The DEIS plan does not have enough consideration of stormwater management, both right now and certainly in the future. Even existing highways are degrading lands near them, and this was not included in the DEIS. This is a major weakness of the DEIS which needs to be addressed as it will detrimentally affect the health of our waterways. The DEIS should focus more on mitigation methods, such as stream restoration, especially considering its plan to increase impervious surfaces. The path of the beltway expansion will impact our public park lands, including vulnerable wetlands, waterways, and wildlife. To be more specific, 1500 acres of canopy would be lost, as well as 50 acres of wetlands. Thirty miles of local waterways will be affected. For example, the portion of Rock creek that would be in the path of the planned expansion area includes vital wetlands, critical floodplain habitat, and homes. On appendix page 66, it shows 243 threatened species but there is not a clear plan as to how to protect these species were the expansion to take place.

DEIS does not show how induced demand will be included in the study. The high price of such a project needs to be underlined. It will take between \$500 million and \$1 billion in public revenue. The DEIS is not clear on exactly how much this expansion will cost taxpayers. Water and sewer relocation would increase water bills on residents. The Washington Suburban Sanitary Commission (WSSC) noted that it would take approximately \$2 billion to move all of Montgomery and Prince George's water and sewer pipeline and associated systems due to the highway expansion.

Widening the beltway would be a mistake because of the negative impact on the local environment and residents. We need to focus on transit alternatives that will reduce air pollution and provide a safer alternative for residents. In the context of climate change, we need to move forward towards a clean energy future with smart growth and away from sprawl and ever-increasing air pollution from additional vehicles on the highway.

My name is Lauren Brown and I am testifying as an individual. I live in Chevy Chase, MD. The current Beltway is right behind the houses on my street (Glenmoor Drive, Chevy Chase, MD). As a resident living right next to the highway, increased air pollution could be a public health problem for me and others living in the North Chevy Chase community. Subject: Opposed to widening of I-270 & Beltway

I am opposed to the plans for widening I-270 & the Beltway and adding toll lanes.

I've lived in the area since 1980 and it seems that construction on some part of the beltway or 270 has been happening almost constantly over the years. Every plan is supposed to ease congestion, instead it adds to the congestion while the multi-year project is underway. Once finished it has just seen an increase in the number of cars rather than an easing of congestion.

At this point we have seen the environmental harms created by more and more cars, even as they get more efficient, they still add to the pollution and the noise level. It is time to consider alternative transportation that may be better for both the environment and people. We need to be thinking in terms of moving people between destinations not cars.

What happened to considering the monorail next to 270, or increasing the MARC service so people who use MARC do not feel stuck?

We have already seen that the claim of no tax payer dollars would be required for the addition of toll lanes is not factual. I've had to commute into Virginia and see the relative use of the toll lanes between the Dulles Toll and Route 50, the toll lanes are not worth the toll.

Please stop this plan for widening the roads and consider plans for more intelligent travel instead.

thanks,
Wendy Brown

chris bruch

I fully support the I-495 and I-270 P3 project and urge you to move it forward as fast as possible. Maryland has fallen considerably behind Virginia and traffic congestion levels in Maryland are causing Montgomery County to lose businesses, jobs and high-net-worth individuals.

Matt Bruening

I oppose the I-495 and I-270 project. I support the no-build option.

Francine Bryant

My major concern is the area of 270 that is very near my house in the Rockshire area. Having lived in this house for 16 years and in a townhouse for the previous 14 years in Regent Square, the traffic pattern has only gotten worse. The result of this is the HUGE traffic jam going south every AM made worse by the fact that the road shrinks to fewer lanes as it joins into 495. There are BIG businesses on each side of that stretch as road shrinks. Cars are sitting and/or going VERY slowly so all that exhaust is unloading onto Rockshire and Regent Square. As important, the NOISE will only be hugely increased if the 270 roadway between the 2 communities is widened. I love Rockville and I hate to see any homes taken to do this widening. Respectfully submitted Joyce Bryant

Francine Bryant

As I have stated before, The congestion is not going to be reduced by the plan as I understand it. What will happen is increased congestion and exhaust as the traffic merges to go South on 495. That point is right by homes in Rockshire. Now with the Covid, traffic is light but when we are back up to full speed, the pollution will be awful. And taking anyone's home or townhouse is simply not acceptable.

Subject: Re: Comments on DEIS, Widening I-270 and I-495

Ms. Lisa B. Choplin, DBIA

Director, I-495 & I-270 P3 Office

Maryland Department of Transportation

State Highway Administration

707 North Calvert Street, Mail Stop P-601

Baltimore, MD 21202

Dear Ms. Choplin,

I am writing to express my opposition to widening I-270 and I-495 as proposed in the DEIS. I think the state should pursue the “no build” option as the project would carve up local parks, increase air pollution and water runoff, worsen noise pollution and detrimentally impact the finances of local jurisdictions and taxpayers.

I’m particularly opposed to increasing the size of the highways and decreasing the size of public parks. And the seizing a number of private homes and uprooting an African-American cemetery of historical significance is also problematic. We need our green space...both the residents and the environment. Paving over open ground expands the area of impervious surface, increases storm water runoff and contributes to the pollution of Maryland rivers and streams.

The pandemic has altered many residents' work habits. Many people will continue to work from home, thus reducing traffic. This needs to be part of the equation and I believe negates the need for the expansion.

Sincerely,

Barbara Bryniarski

Voicemail Testimony added to file on Oct. 23, 2020

Name: Robert Buchanan

Joint Public Hearing Date: 8/20/2020

Type/Session: Voicemail

Transcription:

My name is Robert E Buchanan. I live at [REDACTED] Springridge Road, Potomac, Maryland 20854. And I am speaking on behalf of myself as an individual as well as I am president of the 2030 Group, which is a regional organization comprised of Business Leaders throughout the Maryland, Virginia and DC area. My comments today are that this is an economic imperative and I appreciate the need for the formality of the of the various environmental impact statements, etc. But, if we don't have a sense of urgency on the need for these critical corridors to be improved and the requirement for the appropriate investment in the infrastructure improvements, our region will suffer greatly when it comes to the attraction and retention of the workforce that we've been so proud of over the years that have caused us to be one of the higher developed regions in the country. Unfortunately, we have not been tending to our transportation infrastructure and the tendency in the past to have transit be the be-all-and-end-all is going through a real transition now due to the pandemic and it will be sometime I feel before we truly know what the balance could and should be for our transportation system. But, in the meantime, we have to look at the key corridors such as 270 and the Beltway, especially in Maryland and I truly believe that we're in a period of limbo and no one really understands how we're going to, how the recovery is going to be resolved in a successful manner. There's a lot of doubt, a lot of uncertainty still and we're going through a major transformation, but no matter what, there will be three key elements of a recovery: transportation, housing, and workforce development. Transportation is first and foremost and we must be able to have people get from where they live to where they work. We must be able to have people feel that we're being proactive about the needs for economic development in the future. So I appreciate this opportunity to speak. I hope that you appreciate a sense of commitment to this and and please move with all due haste because this area needs to show how proactive it is in solving some of the issues that have been great challenge.

Subject: Beltway Expansion DEIS Comment

We are writing as concerned citizens and residents of Cabin John Maryland to express our concerns about the proposed Beltway expansion in general, and the draft EIS in particular. We do not believe that the DEIS has properly considered the property takings, noise and air pollution impacts, stormwater runoff, increased traffic on arterial roads, loss of parkland in the Cabin John park which we use on a regular basis, and the impact on cultural resources, including the C&O Canal and Moses Hall Cemetery site. The noise is of particular concern to us -- increasing the Beltway noise, on top of the increase in noise and frequency of air traffic would make living in our Cabin John home very stressful and almost unbearable. We also question the need for the Beltway expansion given recent trends and the projection that many more work from home options will be available to limit commuter traffic on the Beltway. Finally, we do not believe the DEIS fully examined alternatives, such as making the same \$10 billion investment into public transportation and other sustainable, long term solutions.

Thank you for your consideration of these comments.

Brad Buntten

I oppose the I-495 and I-270 project. I support the no-build option.

This project will have a significant impact well beyond that described in the study and acknowledged by the state. This process has been rushed, not completely transparent, and incomplete/inaccurate. The environmental and financial impacts were grossly underestimated and misrepresented. Virginia's "Lexus lanes" are an example of why this should not be approved. The lanes only serve to create more congestion in the non-pay lanes and surrounding surface roads. Only those who can pay (and pay they do) use the lanes. The average worker who can't afford to pay the lanes daily will suffer the most as they tend to live the furthest away. I strongly urge you to reconsider this effort and consider other options. Do not make the same mistake as Virginia. This P3 will put taxpayers and WSSC customers at risk for the next 50 years.

Susan M. Burbage

My home is 1/2 mile from 270. My neighborhood has worked for years to plant trees and to help the watershed area and the environment. We have 3 schools in our neighborhood- we are definitely concerned about the quality of our air and the noise Please don't destroy what we have taken years to build.

Question - are you a human or just a data machine? Please care for your people not your machines
Don't widen 270/495

Andrew Burke

Dear MDOT,

I write to express my strong opposition to the I-270 expansion. I support the "no build" option.

My family and I live in the Rockville West End neighborhood which abuts I-270. We, like many of our neighbors, are a young family who specifically sought out the West End/ Woodley Gardens neighborhood for its tight-knit, inclusive nature, excellent schools, walkability and proximity to great parks (e.g. Woodley Gardens Park). Nelson Street is the unifying thoroughfare of our neighborhood; providing ready access to the parks, pools and Carmen's Italian Ice. Under any of the retained proposals which envision expansion of the I-270 physical footprint, it is inconceivable that these could be implemented without fundamentally altering Nelson Street and the joint neighborhoods it sustains. As an I-270 commuter I feel the pain caused by its current degree of congestion; however, destruction of the West End/Woodley Gardens neighborhoods is too great a price to pay for modest traffic relief.

Moreover, traffic growth projections for I-270 which undergird the State's case for expansion utterly fail to account for the large-scale shift to telework by our region's major employers in response to the global pandemic. This broad transition to remote work has removed such a large share of former I-270 commuters (myself and my wife included) that traffic on this freeway now flows freely at all hours. Indeed, according to statements made by Maryland I-495 and I-270 P3 Program spokesman Terry Owens, traffic volume on both roads decreased 50% in large part to adoption of these telework flexibilities. Given the demonstrated success of maximum telework over the past eight months, it is expected that most positions which previously required one's physical presence in a DC office building will either convert completely to remote work or offer the option of majority remote work for the long-term. In either case, traffic growth on I-270 slows significantly or retreats outright such that the need for additional capacity goes away. Given the years of disruption, destruction of established neighborhoods and allocation of billions of dollars of MD taxpayer monies inherent in any of the "build" options on I-270, the rationale for expansion must be unimpeachable. For at least the reasons discussed above, the I-270 P3 Project fails this crucial test. This is why I support the "no build" option.

Sincerely,

Andrew Burke

Pamela Burke

Please let me tell you why I oppose the I-270 and I-495 project, and support a no-build option. As someone who has spent time in Europe and South America I always come home wishing we had anything close to the transportation systems I find there. I can easily and inexpensively travel without a car. Biking is especially safe and enjoyable. The transportation network available in other parts of the world serve those populations to not only provide alternatives to the use of automobiles, they allow much less continuing construction that destroys homes, businesses, and nature, they keep revenue available for other uses (such as pandemic preparedness and supplies), and keep greenhouse gas emissions lower than they otherwise would be. They make those places enjoyable and accessible for tourists as well as residents. This determination to continually try to build our way out of congestion has long been demonstrated to be a fool's errand. I understand that there are powerful interests involved that have a huge financial stake in building and maintaining these boondoggles, but we would all be better served if the focus was on maintaining what has already been built and finding alternatives that are less harmful to the environment, more cost effective in the long run, and more likely to address the very real threat of climate change. You don't really need a Managed Lanes Study Draft Environmental Impact Statement to know this, you just have to look at what so many other states have done. Please use this link to learn why, as a taxpayer, I've had enough <https://t4america.org/maps-tools/congestion-con/>

Jane Burner

I oppose the I-270/I-495 P3 project. I oppose the widening and support the no build option.

Why? Because it will have a negative impact on me as a taxpayer- - think of the Purple line collapse.

In addition, expanding I-495 into Rock Creek, Sligo Creek and Greenbelt Park will affect quality of life for nearby residents and cause further environmental degradation.

In addition, don't we have enough of a challenge with storm water runoff? Why compound this consequence of urban infrastructure by adding hundreds of acres of impervious road surface?

Jane Burner

Debra Butler

I oppose the 495/270 expansion. I support the no build option for a multitude of reasons.

This enormous DEIS is both much too long for proper comprehension

This DEIS is deficient in the information that is really important to the public who, please be reminded, are the ones the project is ostensibly meant to serve.

This DEIS is written for another period that we may never again see in our lifetimes. Covid itself has made the DEIS irrelevant to current conditions, but the DEIS is being pushed ahead right now, in a time of unprecedented uncertainty. What, after all, is the point of a study based on traffic models that no longer apply?

The people on the ground who live here will be collateral damage in what amounts to a war on our communities.

We will lose precious woods, playgrounds, open space, fields, recreational facilities, fields and open space, firehouse, wildlife, and much more. The air will become dirtier, our health will become worse. There will be more flooding than ever.

That is why we support the no build option, and ask that you face up to the need to start over. Don't continue on this path to misery for us. We matter. The environment matters. Our economy matters. Stop now and don't waste any more.

Chaula Butterworth

I would like the State to come and address my community. Private/public projects would seem to benefit the private company first and foremost. If they didn't know they would make money why do it? What happens during a pandemic when travelers will stop or reduce driving? Will the private company be paid with tax dollars directly instead of toll revenue? If the private entity is the primary concern what does that mean for us, the people who will live directly next door to the construction and hear the traffic noise?

Also, I really do not understand why we aren't expanding our mass transit options. Why not extend RideOn buses to the edge of the county, or extend Metro trains? I feel like building more highway lanes for the exurbs only adds to pollution, and burning of fossil fuels, and takes away from a true benefit to living in this area - mass transit.

Bryant Cabo

I propose a bicycle and pedestrian path that is the same curve radius as the freeway similar to the ICC Trail from Georgia Ave. to Norbeck Rd. The proposed path should go under bridges and over roads to minimize crossings, should have the same gradient as the freeway and no sharp curves and built along all of I-270 & I-495 including the rock creek section to reduce travel times on bicycling on the rock creek trail. Travel times from Forest Glen Metro to Rockville by bicycle would be slashed from 70 minutes via Rock Creek Trail to 35 minutes via I-495 & I-270 Trails during non-peak trail hours for a fit bicyclist.

Clare Callaghan

I oppose the I-495 and I-270 project. I support the no-build option.

This analysis is flawed because its underlying demand assumptions ignore the coronavirus impact on work habits. Also, this analysis does not include the effects of the most recent mitigation measures, such as on-ramp lights.

The project is flawed because its impact on our schools and student-athletes will exacerbate health issues among our most vulnerable citizens. Nothing like ruining their health and sticking them with the bill (because the project costs will linger for years) just to satisfy one term-limited person's edifice complex.

Very truly yours,
Clare Callaghan

Dylan Cambier

As a resident of Maryland all my driving life (8years) I have found myself constantly battling rush hour traffic all day long on both Highways listed (495 and 270). Aside from making public transportation in the DMV infinitely more effective and affordable, I genuinely believe that the only potentially option to reduce horrendous traffic would be to turn both highways into 6lanes going each way and to limit trucks to only 2 or 3 of the lanes.

Cc: aklase@marylandtaxes.gov; treasurer@treasurer.state.md.us
Subject: Public Comment for: I-495 and I-270 Expansion Draft Environmental Impact Statement (DEIS)

Good Afternoon,

I would like to offer my comments on the DEIS for the i-495 and I-270 expansion. **I oppose this project and I support the no-build option.**

I live in the Indian Springs neighborhood, at [REDACTED] Clearview Place, and am very close to the beltway already. Our Indian Springs Local Park, the YMCA, and the greenery that serves as a buffer to the beltway will be partially destroyed, and that is unacceptable. I am a bicycle commuter to my job as a teacher in DC, and I believe we can do more to get cars off the road and offer options for others, like the bike lanes that now make my commute much safer and more pleasant.

Since I live here, I am fully aware of how this expansion project would increase the headaches, pollution, noise, and frustrations of everyone nearby. Every year when I wash my windows, I clean layers of pollution from the beltway from them. I hear beltway noise 24 hours a day. I occasionally smell the pollution. It is disheartening and criminal to continue to expand this project and continue to take control of nature, when we so desperately need to step into an environmental stewardship role.

This project will not achieve the goals it is setting out to achieve, and will harm communities and the environment along the way. Expanding roads leads to more traffic and congestion, it does not ameliorate it. A clear majority of transportation studies show this. There is no clear evidence that this project will achieve what it is setting out to do. And yet it is being considered as a viable project. Without knowing the true negative - and positive - impacts of this study, but knowing for sure that the positives are slim and paltry, it defies belief that we would consider moving forward with this proposal.

Estimates of Maryland subsidies would be upwards of \$1 billion, not to mention the \$2b required for the WSSC catalogue of work needed to assist the project, I am concerned that this project is fiscally irresponsible and cavalier. In light of the partnership that has now stalled the Purple line construction, which has torn up our roads and inconvenienced many for many years, this new project amounts to a handout for contractors and toll fee operators, at the expense of the very people it would expect to serve, the surrounding environment, and local communities. Maryland needs to endorse smart, green projects rather than unseemly, outdated, and polluting ones. Maryland has also not shown an ability to follow through on major green infrastructure projects, and this is unacceptable.

The environmental concerns alone are staggering: Increased particulate matter, carbon monoxide, ozone, nitrous dioxide, and greenhouse gas emissions in local communities is not acceptable, especially since there is no mention in the proposal to deal effectively with any of it. I am a proponent of finding new solutions, rather than expanding polluting solutions. More surfaces leads to more traffic, as every analysis of traffic and construction as shown, and we do not need more traffic. Indeed, in an era when climate change is going to dramatically enhance the force and volume of water flow, these surfaces will be impediments to community management rather than assist in them.

In general, I believe that Kyle Hart's analysis from the National Parks Conservation Association is absolutely correct when he points out that the short review time for 19,000 pages is an incredibly devious maneuver that attempts - like the

emperor and his clothes - to brazenly shield its impropriety with bluster and cavalier disrespect for our environment and all the living creatures within it.

I oppose this project and I support the no-build option. Please consider my opinion as a community member, a staunch conservationist, a bicycle commuter, and a voter.

Sincerely,

Scott Camillo

Andrew Campbell

I am in firm support of widening 495 and 270. After seeing the success that similar projects are having in Virginia, I can imagine why Maryland would risk falling behind in community and economic develop by allowing our roads to further and further slow to a crawl. If the goal of the state is to grow our communities and economy, especially in reference to competition from across the river, then it is critical that these projects move forward.

Toby Capion

Please do not approve tolling. Please keep it a freeway available to all drivers. Add extra lanes as necessary without the need to shift traffic in and out of lanes with tolls. Concentrate on expanding traffic flow over the Potomac River. Add a second bridge if necessary or a double decker bridge.

Sent: Monday, November 9, 2020 11:17 PM
To: MLS-NEPA-P3
Cc: pfranchot@comp.state.md.us; Joanna Kille
Subject: statement in opposition to the draft I-495/I-270 expansion Environmental Impact Statement (DEIS)

To the Maryland Department of Transportation--

We are Ross and Louise Capon and have lived 24 years at [REDACTED] Shelton St., Bethesda. Among the "choices" presented in the Draft EIS, we support only the no-build option. We strongly oppose expansion of the highways with or without toll lanes, and are appalled at the Draft EIS's cavalier treatment of climate change.

We support the comments of the Maryland Transit Opportunities Coalition, including the supplemental comment issued today regarding important information MDOT failed to release until this morning, and the "improper segmentation" of I-270 into separate studies even though "the current study involves major capital construction extending 7.4 miles into the" northern segment.

We also support the technical and legal comments released today by 50 organizations which conclude that the toll lane plan is harmful and legally vulnerable.

(1) It is increasingly likely that the pandemic has permanently changed commuting habits such that (a) a significant share of the population will be telecommuting two or more days per week, and (b) it is at best premature to seek further expansion of capacity aimed largely at peak hour travel. The old rush hours may never be the same. In Virginia, toll revenue is down significantly on both I-95 and I-66. [Transurban announced last month it was selling stakes in the I-95 express lanes.](#)

(2) "Build it and they will come" is a well-established phenomenon, as is the threat to the planet posed by continued highway construction based on that phenomenon. The additional vehicle travel induced by capacity expansion increases GHG emissions as well as other negative environmental effects, including air, water and noise pollution. Quality of life also will be harmed permanently due to significant land takings, including those affecting parks and an historical African-American burial ground. It is time to focus investment on transit which has been badly neglected in Maryland. Toll lane construction itself would be a nightmare and a considerable source of noise and air pollution.

(3) The completed Purple Line will help relieve Beltway traffic. Two of our sons graduated from UMD College Park while commuting mostly by car and only occasionally by the slow buses. The Purple Line, had it existed, would have replaced many of their vehicle miles. It is appalling that the state has allowed construction to stop -- not just for the indefinite harm done to communities and businesses along the route, but also pushing further into the future the opportunity for improved transit across two counties. This project must be completed and its benefits understood before any further consideration of Beltway lane additions. It is disappointing that MDOT apparently is leaning against the cheapest and quickest completion solution -- reaching agreement with the consortium that walked.

(4) This project was advertised as imposing little or no costs on taxpayers, but that clearly is not true. WSSC and its ratepayers are liable for up to \$2 billion to relocate water and sewer pipes. Beyond that, it seems clear that the state will have to shoulder a considerable amount of the risk; private contractors are not Santa Claus. More generally, a recent report states, "P3s are often mentioned as a solution to [the roughly \$1 trillion shortfall over the next decade facing U.S. surface transportation]. This idea is simply wrong...As the U.S. Treasury Department notes, 'All infrastructure investments ultimately depend on either user fees, government tax revenues, or a combination of both.'" Particularly in

light of the pandemic, any private consortium is going to insist on significant insulation from risk -- with both taxpayers and toll payers shouldering unadvertised risk.

<https://www.americanprogress.org/issues/economy/reports/2018/02/15/446720/public-private-partnerships-fail-look-southern-indianas-69-project/>

Please shift your focus to transit improvements.

Thank you for considering our views.

Julianne Cardemil

To whom it may concern,

I oppose the I-495 and I-270 project. I support the no-build option.

I am concerned about the environmental impact of this project on our city. The construction process will take years and negatively impact the quality of life of those who live near it between noise and increased construction related congestion. Increased emissions will pollute our air where our children play at parks adjacent to 270, the seniors gather at the Rockville senior center and where our kids learn at Julius West Middle School. We already experience a lot of noise pollution from 270 in part because there is no noise wall next to our neighborhood.

The pandemic will permanently change work, commuting, and development patterns. The pandemic's long-term effects on traffic are unknown. It seems imprudent to spend millions of dollars widening an already huge road when we do not know what traffic needs will be a year from now.

Additionally, I am concerned about the project's burden to taxpayers and the length of time construction will require. I am also very concerned about neighborhood businesses, parks, and houses will be taken down to accommodate a plan that has highly uncertain projections underpinning its effect on traffic and commuting patterns and could actually make the situation worse.

I support the consideration of reversible lanes on I-270 after more is known about the long term effects of the pandemic on traffic, and I support increased use and support of public transit.

Thank you for your consideration.

nina cardin

Dear MDOT and SHA, I am against the I-495 and I-270 expansion for so many reasons. First and foremost, it will cause irreparable environmental damage including destroying 50 acres of essential wetlands and 1500 acres of forest canopy. As if that isn't enough - at this very time that we must seek every way possible to reduce our carbon emissions, both the traffic and the environmental loss brought about by this expansion will increase GHG emissions to the detriment of all. In addition, the placement of the highway expansion would add to the amount of environmental pollution already experienced by over-burdened communities. This in the very summer of America's awakening to the impact of COVID to low-income communities and communities of color because of historic environmental burdens placed upon them. In addition, the DEIS does not take into consideration external costs of upwards of \$1 billion of taxpayer dollars needed to fund the required relocation of water and sewer infrastructure, nor does it account for the cost of adequate environmental mitigation. This is only the tip of the iceberg. And to cap it all off, it is not even clear that - given our changing work and commuting habits that COVID 19 is creating - we will even need this expanded roadway. Estimates are that a 5-15% reduction in rush hour traffic would end congestion - a projection certainly within reach given the new world we live in. Widening these lanes is building for yesterday and contributing to a damaged tomorrow - we need to build creatively for an environmentally vibrant and economically healthy tomorrow. Do not build that road.

Susan Carlin

I strongly oppose I-495 and I-270 project. I support the no-build option. Reasons for are noise levels are already awful for affected neighborhoods, the cost will be tremendous given the current pandemic and overruns on Purple Line that still isn't finished, Along with air quality and environmental impact too for the region. I also believe given extended work at home options from pandemic could change the number of cars on the road. I believe businesses will allow work from home from now on and this impact will take a few years to study.

3 MR. CARLISLE: My name is George
4 Carlisle, G-E-O-R-G-E, C-A-R-L-I-S-L-E. My
5 primary residence is at [REDACTED] Manor Stone Lane
6 Columbia, Maryland, 21044.

7 I'm grateful for the detailed information
8 that has been provided by MDOT to help the public
9 understand the dimensions of this potential
10 project. I've browsed and read over 20,000 pages.

11 After reading these documents I have
12 decided to vote for the No Build option. My
13 summary decision comments are based on the
14 following concerns: One, the solutions presented
15 are temporary fixes. We will never have enough
16 roads in Maryland as long as we keep developing
17 homes and apartments.

18 No. 2, Trans Urban. I'm unsettled about
19 their business practices with the current Maryland
20 Administration, and whether they should be given a
21 monopoly on Virginia and Maryland roadways.

1 No. 3. In my opinion this project has
2 too many hidden costs and the project costs are
3 too low.

4 No. 4. This project is too big and long
5 for true accountability. No. 5. Due to COVID-19,
6 I think the traffic models in the reports are
7 questionable now.

8 No. 6. Due to COVID-19 I have watched
9 the Purple Line construction, another big Maryland
10 Project, enter a period of near collapse due to
11 delays.

12 What if this happens on the 270 and 495
13 P.3 and the cost balloon. Ultimately I feel the
14 most practical solution is to reduce the number of
15 cars on Maryland roads.

16 We need to take a page from Virginia's
17 Transit Playbook and boldly expand the Metro
18 Subway Line to Frederick County, Maryland.
19 Expanding will allow accelerated wealth creation
20 in ease commuting to Frederick, Carroll,
21 Washington, Allegany, Western Howard Counties, and

1 parts of West Virginia.

2 I have given a three-minute summary of my
3 detailed comments. I will submit detailed
4 comments before the new deadline. Thank you for
5 taking my comments.

To Board Members and Secretary,

I-495 & I-270 Managed Lanes Study Detailed Comments

This letter is an addition to my summarized one-on-one testimony given at the Rockville Hilton on September 10, 2020.

I'm grateful for the detailed information that has been provided by MDOT to help the public understand the dimensions of this potential project. I've browsed and read almost 20,000 pages. I've learned how Virginia and Maryland Public Works are created, managed and implemented.

I want to take this moment to recognize an MDOT employee, Marion Harris (Executive Admin Assistant), who went the extra mile to ensure discussions, arrangements, and questions about the P3 moved forward to resolution. She took my calls late nights weekdays and weekends. She did follow-up too. I was impressed that a Maryland state employee could show such dedication to her tasks. I look forward to seeing the final environmental impact statement (EIS).

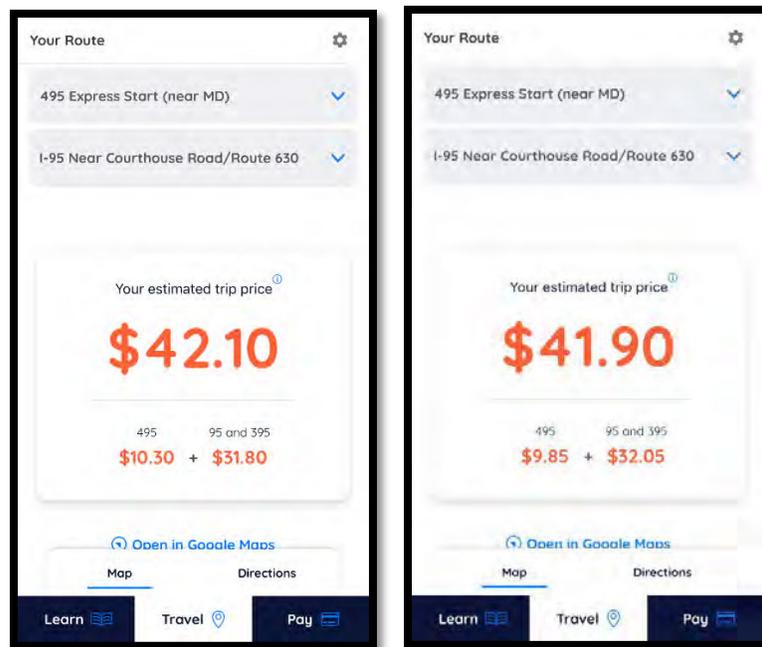

After reading these documents, I have decided to vote for the “No-Build” Option.

My detailed decision comments are based on the following concerns:

1. The solution(s) presented are temporary fixes and not comprehensive – We will never have enough roads in Maryland if we keep developing home and apartment communities. I think a solution(s) needs to better detail coordination with other options (Metro and local county transportation solutions). Fundamentally, the 270 & 495 P3 just encourages more driving.

Should we not have a comprehensive solution for 11,000,000,000+ dollars?

Should Montgomery and Prince George’s Counties be the principle toll revenue source?

(Pictures were taken from Transurban’s Virginia ExpressLanes mobile app during the weeks of October 12-23, 2020)

2. Can we trust Larry Hogan? He's been wrong on so many things lately. Last year, Gov. Hogan visited Australia and had meetings with Transurban, WestConnex (51% owned by Transurban), Macquarie (Together they are the "Accelerate Maryland Partners LLC") and exchanged gifts but he didn't visit any of the other bidders who had projects in Australia. Why???

Is this how you create a CREDIBLE public private partnership competition?

3. In my opinion, this project has too many hidden costs and untested solutions

First, I looked at the ICC Toll Road Project and reviewed the details and it cost almost double what was originally specified. If this holds true for 270-495, could we be looking at 18-21 Billion for construction? The ICC roughly generates \$60,000,000+/- per year. If we multiply that by 50 years that's 3 billion dollars.

How much revenue annually will need to be generated for the 270-495 bidder(s) to make it viable?

270-495 P3 Low end estimates -> \$200,000,000 per year x 50 years = 10 billion (roughly)

270-495 P3 High end estimates -> \$500,000,000 per year x 50 years = 25 billion (roughly)

Second, the Innovative Congestion Management Project uses a progressive design-build with VERY ROUGH Estimates. There are sections that have the details omitted and say simply "TBD." I know this is a "Progressive" project but I question the simulation & assumptions data and the expert opinions about the duration of product and software lifecycle in the field. As of today (November 9th, 2020), the project is currently 68% complete and is scheduled to be fully complete by late summer 2021 pushed back from the originally date.

Can MDOT SHA give any examples nationwide of anyone else using MDOT's "innovative" congestion management solution?

In closing, we need more details put into the DEIS. This proposition is simply unacceptable in its current form.

We need a structured Maryland P3 office similar to what Virginia has, <http://www.p3virginia.org/>, but with the ability to process FOIA(Freedom of Information Act) to show where the money goes when the public has concerns. Example, Virginia denied my request to look at any financial information related to P3 toll road revenues or what the state took from the P3 supplier(s) income. Our state government should work differently to ensure that citizen's confidence in their government is maintained.

When the Government gives up \$1,000,000,000+ in toll revenues since 2015 and then wants to give away key highways to private industry to charge unlimited amounts of tolls on the basis that it won't "cost" them anything...I don't have a lot of confidence in that strategy.

George Carlisle

Peter Carlson

I am a Rockville resident and voter and I strongly oppose the plan to widen 270 and put in luxury lanes. I don't think this plan will help to alleviate traffic on 270 at rush hour. In fact, it might make the traffic problem worse. (A better plan might be to widen 270 further north, where it narrows to two lanes in each direction, causing a bottleneck.that backs up for miles.) I believe the current plan would result in massive air pollution, cause the destruction of many local houses, and countless trees, and result in years of construction noise and tie-ups. It will cost taxpayers lots of money and benefit only the private company operating the for-profit toll lanes. It is a bad idea and I urge you to reject it.

Mariana Carrese

Hello,

As a lifelong resident of Montgomery County and daily driver of I-495 and I-270, both North to Frederick and South to Tyson's Corner Virginia, I am writing to you today to voice my opposition to the I-495 and I-270 project. I support the no-build option.

Even in my lifetime, I have seen how traffic patterns can worsen all the time. This proposed expansion and toll lanes, however, is not a solution. If we are to learn anything from 2020 and this pandemic, it is that working from home has done wonders for both traffic management and environmental quality (reduced air pollution especially). 2020 has shown us that changes such as these are not only possible, but necessary. Without a vaccine available for everyone until deep into 2021 and the potential for other global crises such as COVID-19 to occur with a greater frequency than once every century, now is the time to think about better solutions. The answer is to not strain the local or state economy right on the heels of a global pandemic. Nothing in life is "free" there is no such thing as a cost-free solution.

Reversible lanes and greater support for flexible hours and telecommuting will put our current resources and roadways to better use. These solutions will be better for individuals 'schedules, personal health, economy, and environmental health. Building more impervious surfaces, creating more runoff and erosion, how is this ever a responsible option? The time and money that will be lost on another bandaid solution will neither encourage economic growth, nor assist the many now struggling in light of the events of 2020.

Now is the time to look towards a more socially and environmentally responsible future, making smarter usage of the lanes we have and learning from the experiences of varied workplaces and solutions this year.

Thank you.

Subject: Beltway widening

A few point:

1. We should finish the purple line first.
2. Work and travel habits have changed drastically because of the pandemic. More people are telecommuting, and companies say they will continue telecommuting when restrictions are lifted. We should take some time to figure out what this means for beltway traffic before making such an investment.
3. I know the party line is that this isn't going to cost the taxpayers any money. I just don't believe that. Our state and county already has one of the highest state tax burdens. I want to continue to live in Montgomery county, but as a retiree, it seems more impractical very year.

Subject: Support for NO BUILD option in Managed Lane Study DEIS

Dear MDOT,

I support the **NO BUILD option** in the I-495 & I-270 Managed Lanes Study DEIS. I concur with the analysis and comments sent by the **Maryland Sierra Club**.

Specifically, with global warming as the existential threat to the U.S. and the world, adding car travel lanes to a highway is exactly the wrong action to take if our goal is to reduce carbon emissions. Instead, MDOT should innovate on improving and aggressively marketing transit solutions, specifically buses which are flexible, low cost and faster to implement compared to rail infrastructure, with clean options available. DEIS does not address as alternative to adding managed lanes.

My family lives just south of the 29/Colesville Rd interchange with I-495. Preliminary design shows one of the two access points to the proposed managed lanes on the Montgomery County section of the beltway will be at Colesville Rd. **No analysis has been done on the impact of having a managed lane access point on a state highway that is one of the most congested roads in Montgomery County.** There will, no doubt, be additional traffic on Colesville Rd, but **no study has been done to inform residents about increased traffic** using Colesville, as well as local roads and neighborhood cut through traffic. I request SHA conduct such a study and inform impacted residents.

An environmental justice [map](#) from the Maryland Institute for Applied Environmental Health shows the area around the Colesville/495 interchange has the highest level of air pollution. I envision this getting worse with the added traffic utilizing one of the few proposed managed lane access points.

Thank you for considering my comments.

Rebecca Chapin-Ridgely

I'm commenting to express my support for the no-build option. 270 congestion is a real problem, but express lanes are an entirely insufficient and short sighted solution. If we were willing to invest the infrastructure to support it, there is demand for public transport solutions. It's truly a shame to see Maryland invest in the out dated express lane concept instead.

As a taxpayer, the amount of money the state would spend for a marginal gain is just shameful. The DEIS identifies multiple serious concerns, the most serious of which being the 8 to 2 lanes bottleneck that will congest traffic. Please for all that is decent try something different. Do we want to use hostile toll lanes to solve every traffic issue like Northern Virginia does? Maryland should strive to be better to their citizenry than that.

We need more transit, not more lanes. Wake up to 2020!

Margaret Chasson

Howard CHAZIN

I live in Rockville near the Montgomery County Detention Center and can see and hear 270 out my back yard. The 12 lanes of highway at this point in Rockville are enough Adding more roads will not fix the problem of bottlenecks at the 495 splits. There is already enough noise in my neighborhood from 270 so if you build, you need to include sound walls for all abutting neighborhoods Also 270 North of 370 narrows to 4 lanes then 2 lanes - this slows traffic as well - so why not widen north of 370 first if you have to widen at all? Wider roads bring more development - look when 270 was first widened to 12 lanes in the 1980s - that just led to more development towards Boyds and Urbana. If you want to, use smart lanes that reverse in the morning and evening. With more people working at home, fewer people are on the road now. This is just a big waste of taxpayer money.

Janet Chiu

We moved permanently to Montgomery County from Georgia in 2012 after renting in Fairfax County for three years, mainly because Virginia has essentially been paved over. Now, when we enter Virginia, we feel engulfed in an endless sea of flyovers and concrete highways that we anxiously navigate. We find that entering and leaving express lanes is confusing. Ironically, until COVID, even with the expansions we could count on getting stuck in traffic.

We don't want this type of environment in Maryland. We value the quality of life and human scale of the roads in Montgomery County. More lanes, especially express lanes, will not solve the intended problems.

We hear I-270 from our house, as do thousands of others homeowners and renters. The proposal to widen it will result in deafening volume, thereby diminishing our quality of life and the value of our property. Sadly, it will also mean the irrevocable loss of green space and all that live there.

We implore you to drop the idea of express lanes and to continue good stewardship of the communities in Montgomery County.

Sincerely,

Janet & Alex Chiu

Triften Chmil

The last thing we need are more highway lanes. Realized highway capacity does not benefit from additional lanes past a certain point. What we need is better run public transit. Rail and bus lines carry far more people than personally owned vehicles.

The project intended to widen 270 and 495 is moving forward. I live in Maryland and am extremely concerned. Taxpayers and WSSC customers could be paying for this for 50 years according to DontWiden270.org and Citizens Against Beltway Expansion. **I OPPOSE THIS PROJECT AND SUPPORT THE NO-BUILD OPTION.** Please find better things to do with tax payer money.

Thank you,
S. Cholwek
Maryland resident

Ishani Chowdhury

Hello - As a homeowner, MoCo resident, taxpayer and concerned citizen, I oppose the expansion on 270/495. Increasing lanes, while not providing mass transit options, will only increase traffic jams, destroy the environment (land, water and air pollution), and impact 1500 homes, destroying 34. Take a look at Atlanta, GA - it has a 16 (sixteen) lane highway running through the middle of the city, that would get jammed daily (before COVID) - it did not solve ATL's traffic problem, but rather increased commuter frustrations.

Widening 270/495 is ATL in the making. It will be a self-feeding cycle, wherein the government will find excuses every few years to keep widening as the traffic increases, and giving the 'right' of eminent domain to uproot families and destroy communities in the process.

Consider mass transit options that will incentivize businesses to move along that 270 corridor. Doing so will bring more businesses to the area, increase existing home prices, and encourage developers to build more homes near the area. All in all, that will be a win-win. Widening 270/495 is a mistake And voters will remember.

Hello. Although I commute to my job in Bethesda using I-495, I am opposed to the expansion. In fact, I moved to my current neighborhood with the expectation of ending my car commute and taking the purple line when (and now if) it's completed. I would much rather see the funds for this expansion project put toward the purple line and other public transportation programs. There are a lot of beautiful homes around the beltway and you are lowering their home values and the quality of life for these Marylanders.

Julie Christensen
[REDACTED] Eton Rd
Silver Spring, MD 20901

Anthony Ciconte

Dear Ms. Choplin, SHA Board and Staff:

I do not support the I-495 & I-270 Managed Lanes Public-Private Partnership (P3) Program. I support the NO-Build option. Adding toll lanes to the beltway would only benefit wealthier drivers and whatever company that is managing the project. Toll lanes have done NOTHING to alleviate traffic in Northern Virginia. If you drive there (like I do) you would know that the toll lanes have actually made traffic worse. A better and far less expensive proposal would be to build a North-South truck bypass around Washington.

Anthony Ciconte
9/4/2020

Andrea Cimino

I am opposed to any expansion of I-495 and I-270. It is not responsible for our state government to provide a \$1 billion subsidy for this project, which is expected to destroy wildlife habitat, contribute to air pollution and climate change and make traffic in the region worse. Maryland should instead be investing \$1 billion in sustainable transit, transit-oriented development, better biking and walking infrastructure and more public parkland and habitat conservation. Especially as more employers move to telecommuting for the long-term, this project seems like a classic boondoggle and waste of tax payer funds.

Debra Clark

I oppose this project and support the NO- BUILD option. While I believe transportation options need to be considered in order to support the needs of the community, I don't believe especially with the increase in telecommuting since COVID that destroying acres of park land and homes in communities such as the Indian Spring neighborhood is necessary. It would be reckless and harmful to our community and the environment without any measurable benefit in transportation relief.

Jill Clarke

Please do not widen 270 and 495. As a resident of Rockville I oppose this project and support the NO-BUILD option.

Robert Clasen

I strongly oppose the the widening - if it were magically to happen without disruption to the neighborhood and the environment, it would still not help. A few years down the road the beltway would be just as jammed.

Patricia Clifford

I oppose this project and support the NO-BUILD option.

Subject: RE: DEIS and P3

Dear MDOT officials,

I write to you about the proposed P3 project and the recent released DEIS and it's impact on my household and community. I live in Woodley Gardens a neighborhood in Rockville, and my house is within 200 yards of I270. Traffic noise and pollution are a daily and nightly factor in my life, and I ask you not make it worse by widening this already behemoth highway. I do not support the project in any iteration and support a **no build** option. I ask that you wait, give the project a rest until we understand completely the economic and potential transit changes that will result from the COVID-19 pandemic. I commute into WDC and have already seen a change in the traffic volume. The traffic flow lights installed on the 270 ramps have not been activated yet and maybe all that is necessary to mitigate congestion. I read and hear daily about offices and companies that are and will consider telework indefinitely for their employees. We still don't know the economic fallout yet and I don't think MD tax payers will be amenable to an increase in their taxes to pay for new WSSC pipes.

After reading section 4.3.3 Environmental Consequences CEA Analysis Area Communities, I have particular concerns regarding the new Gude Dr interchange and it's potential visual and audio changes for Hawthorn Court. The wording is quite vague on the visual changes and I am left to envision huge looming flyways like the 395/95 corridor in Springfield. The new addition of ramps and a larger bridge all create impermeable surfaces which will result in more waterflow and pollution directly into Watts Branch and adjacent streams. Additionally, the Senior Center will lose a portion of its acreage, a loss to the community that utilizes the green space, garden plots and playground equipment throughout the seasons.

Please slow this project down and add mass transit options. Installing more tarmac is simply antiquated thinking and ignoring any type of mass transit is environmentally irresponsible.

I appreciate your time and consideration.

Sincerely,

Judith Cline

Gentlemen,

I've attached a meme that is circulating on Instagram to illustrate the sentiment of many people who live in MC and PG counties. These residents will not benefit from the expansion of I270 nor 495 and will take the full brunt of construction noise, pollution, congestion on the back roads, and now we find out we will also be asked to pay for new water, sewer, fiber optic and gas lines. Appendix C of the DEIS shows that tolls will be ridiculously high and even higher during peak hours only to profit an outside company and not the MD tax payers. I support a **NO build option** and ask that you cease with this project.

Do not be the brunt of jokes made by your constituents, think outside the box.

Sincerely,
Judy Cline

Subject: Comments on the Draft EIS for the proposed Beltway Expansion

Dear Maryland Department of Transportation,

Thank you very much for extending the public comment period for the Draft Environmental Impact Study for the proposed Beltway Expansion. I do think the extra time is needed for the public to comment, given the considerable change and uncertainty that is taking place right now. I will most likely comment again, but I did want to submit comments now to communicate how this highway expansion will or could impact me and why adequate analysis of those impacts is needed.

With the current analysis, I do not support the expansion and support the No-Build option.

I live in Washington, D.C. Like so many residents in the District of Columbia and Maryland, Rock Creek and Rock Creek Park is our back yard. My living room window overlooks Rock Creek Park and, in the winter, we have a nice view of Rock Creek. Even though I do not live in Maryland or Virginia where the actual beltway expansion will take place, I want you to know that this expansion could impact us and needs proper analysis.

The Draft Environmental Impact Study does not properly analyze the additional stormwater runoff the beltway expansion will cause. Analysis should be done to determine the impact of increased stormwater not only during the design and construction of the project, but also the impacts due to increasing the amount of impervious surfaces. In this country today, in our nation's capital, what continues to amaze me is that Rock Creek essentially turns into an open raw sewage channel during periods of rain when there is increased stormwater runoff. We have had this problem for a long time. But we have also made a lot of progress in solving this problem. In fact, in 2005, Montgomery County and several other organizations in Maryland teamed with the District of Columbia government to mitigate this negative impact. There has been considerable effort and millions of tax payer dollars spent to decrease stormwater runoff. It is very disappointing that this highway expansion could reverse much of the progress that has been made. Proper analysis of increased stormwater runoff should be done to provide decision makers to sufficient information they need to make a decision regarding options and possible mitigation.

What unites most tax payers is that they do not like to see their taxes wasted. They also do not like to see unnecessary negative impacts to their property values that increased raw sewage in Rock Creek may cause. This is not something they want to see or smell.

Please do the necessary analysis of the increased stormwater runoff before any decision are made.

Thank you,

Ken Cluskey

I strongly oppose the proposed luxury lanes on I-495 and I-270.

I am very troubled by the impact this proposal will have on our neighborhoods, parks, and streams: stormwater runoff; destruction of forest canopy; increased traffic on local roads; homes taken and neighborhoods destroyed; an increase in water, air, and noise pollution; years of construction leading to additional traffic and delays for the multiple neighborhoods affected. The toll lanes will have an impact on local road networks, where there may be no excess capacity or potential for expansion.

This doesn't even take into account the fact that traffic congestion will not be resolved by this approach, and that taxpayers will ultimately end up paying for this boondoggle for years to come.

I believe a more innovative and less destructive solution can be achieved. Please consider the no-build option.

Subject: Comments on Draft EIS on I-495 and I-270 plan

I support Alternative 1: No Build for the project to widen/expand I-495 and I-270, for the following reasons:

1) Poor Management Model

Purple Line construction is currently in peril and management of this public private partnership has been tenuous. To initiate a similarly modeled project for highway widening while the Purple Line project has yet to be proven puts the financial security of the state and local jurisdictions in jeopardy.

2) Lack of Transparency

The quiet, unannounced addition of 1,600 pages to DEIS documentation post submittal in mid-July leaves serious concern about state accountability measures in place. MDOT extended the period for comments only when this secret insertion was called out and pressure was put on.

3) More cars, worsening environmental impact

The views of the long list of regional and national environmental groups who have lent considerable expertise to this impact should be heeded. As these experts have attested, and multiple long-term studies have demonstrated, expanded roadways bring more cars, and more cars in concentrated areas trigger compounded negative effects on the environment.

4) Telework is here to stay

The pandemic brought a massive and quick onboarding of telework, which many companies and agencies have permanently adopted. This will likely impact drivership across the region as MD and the DMV include large numbers of employers whose work can function remotely.

5) Better mass transit options

Less drivers plus stronger transit options coming on line (including Purple Line) lessen the need for this project and paint its advocates as relics of a past, not in tune with today's transportation realities.

6) Public subsidy will be unavoidable

It is impossible that the project will not contain a large public subsidy, despite what Governor Hogan has promised. WSSC work alone has been quoted at \$2 billion.

7) Virginia's examples

It would be foolhardy to enter into this project, with clear knowledge of the realities of express toll lane projects in our region. Virginia's projects have suffered with their lack of transparency. Furthermore, it is also highly worth noting that from 2018-2019 for VA's I-66 Express lane morning commutes were down 9.2%.

8) Burden on residents (voters)

The cost of the tolls themselves will rest with drivers, a portion of whom may be traversing from non-local regions. But a significant number will be local drivers and even those who opt out of using the express lanes will be burdened by the logistical, environmental and ultimately financial toll of the highway project as a regional resident. Additionally, the DEIS report shows that northbound traffic in the afternoon on 270 will actually become SLOWER between the Beltway and I-370!

Summary: This project is a bad deal for residents, tax-payers and the region; it won't deliver on its promise to relieve traffic congestion, and will reap tremendous financial and environmental destruction in its wake. We shouldn't be using state resources to turn profit for potential project team partners, instead of caring for our residents and environment.

Thank you,

Subject: objection to 495/270 expansion--Support No Build Option

Hi,

I am writing to express my opposition to the proposed 495/270 expansion for the following reasons. Please do not allow the project with its current scope to move forward. Please support the No Build Option.

1) Poor Management Model

The Public Private Partnership model of the Purple Line is a failure. Construction is currently in peril. To initiate a similarly modeled project for highway widening while the Purple Line project has yet to be finalized puts the financial security of the state and local jurisdictions in jeopardy.

2) Lack of Transparency

The quiet, unannounced addition of 1,600 pages to DEIS documentation post submittal in mid-July leaves serious concern about state accountability measures in place. MDOT extended the period for comments only when this secret insertion was called out and pressure was put on.

3) More cars, worsening environmental impact

The views of the long list of regional and national environmental groups who have lent considerable expertise to this impact should be heeded. As these experts have attested, and multiple long-term studies have demonstrated, expanded roadways bring more cars, and more cars in concentrated areas trigger compounded negative effects on the environment.

4) Telework is here to stay

The pandemic brought a massive and quick onboarding of telework, which many companies and agencies have permanently adopted. This will likely impact drivership across the region as MD and the DMV include large numbers of employers whose work can function remotely.

5) Better mass transit options

Less drivers plus stronger transit options coming on line (including the eventual Purple Line) lessen the need for this project and paint its advocates as relics of a past, not in tune with today's transportation realities. The new transit options have not been calculated in the needs assessment for driver rates.

6) Public subsidy can't be avoided

It is impossible that the project will not contain a large public subsidy, despite what Governor Hogan has promised. WSSC work alone has been quoted at \$2 billion.

7) Virginia's examples

It would be foolhardy to enter into this project, with clear knowledge of the realities of express toll lane projects in our region. Virginia's projects have suffered with their lack of transparency.

It is worth noting that from 2018-2019 for VA's I-66 Express lane morning commutes were down 9.2%.

Connected to that, Transurban announced last month that they are now selling their stakes in the VA roads they built, following their \$111 million loss last fiscal year.

8) Burden on residents (voters)

The cost of the tolls themselves will rest with drivers, a portion of whom may be traversing from non-local regions. But a significant number will be local drivers and even those who opt out of using the express lanes will be burdened by the logistical, environmental and ultimately financial toll of the highway project as a regional resident.

Thank you,
Claire Cocciolo
Silver Spring, MD

Abigail Cohen

As a citizen of Maryland who is deeply concerned about the environment, I urge you to reject this plan. Maryland has a serious traffic problem, but more and bigger highways are not the solution. We need incentives for people to carpool, and most of all we need a robust public transportation system that really serves ordinary Marylanders who need to get to work. Previous highway expansion schemes have not helped. Destroying green space is not the answer. We need incentives for there to be fewer cars on the roads, not more. Thank you for considering my views.

I do not support the I270 expansion. It is a large enough road from exit 16 down to i495. Moreover, toll lanes will only make the cost of living around here more unaffordable for those that already struggle to make ends meet. I do however support fixing the American Legion bridge, and potentially expanding lanes up by Frederick where they actually need the additional capacity.

As a taxpayer, I oppose the I-495 and I-270 expansion. The DEIS shows that this project may require a state subsidy to be paid to the developer even without the DEIS study taking into account all of the likely budget or usage/driver demand shortfalls. The projected possible state subsidy does not take into account tax dollars needed to fund relocation of water and sewer infrastructure or account for the negative health and environmental costs which taxpayers ultimately will bear. And because the study segments the project into stages, all of which are integrated parts of a road building P3 solution to our traffic problems, the study does not show the full integrated cost of this solution. It also just moves the bottleneck up I-270. A better integrated solution and wiser use of taxpayer funds is increasing Metro and BRT. BRT would need to run from upper Montgomery County down I-270, integrating with I-95 and with the American Legion Bridge. We taxpayers also need to invest in a Metro circle line around the beltway, with a Bethesda Red Line link over the American Legion Bridge to the Orange Line and Yellow/Green lines. These links are the obvious next inner circle segment after the Purple Line. This public transit approach will reduce environmental and health costs which we taxpayers pay for anyway. Any higher taxes I may need to pay are better spent on (i) bike and public transit, and protecting against more stormwater runoff and forest degradation than on (ii) yet one road construction project to accommodate ever increasing individual cars. Even if all of those cars are EV's, we simply need to invest in moving away from a suburban, car-dependent unsustainable system into sustainable, pragmatic solutions to unacceptable traffic congestion. Thank you.

Jacob Cohn

I am concerned about both the environmental and fiscal impacts of the proposed managed lanes plan. I don't think the study adequately explores the full financial impact/costs associated with the plan, particularly in the context of falling revenues due to CV-19. Additionally, it does takes too narrow a focus on the land effected by the plan and thus underestimates the environmental impact. Finally, it does not adequately explore alternatives, such as increased funding for public transportation.

Rhea Cohn

I am opposed to the proposed Beltway Expansion project. I am a resident of Silver Spring and live in close proximity to the beltway and Sligo Creek Park in zip code 20910. I support the no-build initiative. Not only will this proposed beltway expansion be ultimately have a financial penalty to the citizens of Maryland, it will:

- Cause community members to lose their homes.
- Adversely impact the environment (wetlands, parks) because land will be needed for the project and more cars will cause more toxic harmful emissions.
- Cause increase in noise pollution for those living near the beltway.
- Cause worse air quality for those living near the beltway, thereby increasing problematic pulmonary conditions like asthma. (see research that supports increased asthma incidence near highways: <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3556611/>)
- Cause more storm runoff and increase the incidence of flash flooding

The Purple Line expansion delays and cost overrun is a good example of why public-partnerships with the state do not work.

A first step would be to consider making the Intercounty Connector toll-free, or at the very least, reduce the toll amount. This would increase use of that road which is underutilized, and thereby reduce traffic on the 495-Beltway.

More community involvement and alternatives need to be considered. There is no reason to rush this decision. Last, the financial risk to the citizens of Maryland is huge, since many highway public-private partnerships have resulted in taxpayers having to ultimately support the projects.

Gary Cole

I oppose the I-495 and I-270 project. I support the no-build option.

I live in the Woodley Gardens neighborhood of Rockville and my house is just a few houses away from the I-270 sound wall. I am therefore vehemently opposed to this project. I believe that the widening of 270 will have a direct impact on the value of my home. My friends and neighbors will lose their homes. It is hard to fathom that this project is even being considered. I believe that the real problem is the bottleneck that is created further north where the lanes go from 6 lanes down to 2. No solution will ever work until these north lanes are widened. Widening of these lanes should occur first or this is just a massive waste of money.

The cost of this project is astronomical, and I feel like this will put huge burden on taxpayers----now and for many, many years to come. Due to these huge costs, the proposed toll lanes will be far too expensive for the average driver to use. I have seen and experienced toll lanes in Virginia and they seem to be very under-utilized and I don't believe they have had the impact to traffic as promised. I don't believe that Maryland should ever try to emulate what Virginia has done in terms of their roads and highways---Virginia is a complete disaster when it comes to traffic. Maryland should learn from Virginia's mistakes---unless one of the real motivations is to help a company rake in large sums of money for years to come by charging outrageous toll amounts to drivers trying to get to their jobs.

Further, being so close to 270, I do not want to live through the construction for the next 4-5 years. Not to mention the environmental impact of this project due to increased air and water pollution as well as the impact on parks and on trees.

I believe that there are other options that are not nearly as expensive or disruptive that could help with the traffic congestion---such as reversible lanes. Please kill this project as proposed and go back to the drawing board to explore less costly and more environmentally friendly options.

Thank you.

Gary M. Cole

I-495 & I-270 Managed Lanes Study DEIS/ Draft Section 4(f) Evaluation

I would like to express my opposition to the expansion of the Capital Beltway in light of the findings of the Draft Environmental Impact Statement. **Also, I would like to support the no-build option.**

As a homeowner who lives less than a mile from the Beltway, I'm greatly concerned about the additional congestion on local roads such as Georgia Ave and Colesville Rd, both of which are just as congested as the Beltway and will only become more so if the Beltway is expanded. In addition, I worry about increased vehicle emissions and environmental damage to our local parks, which serve an integral role in stormwater runoff. By reducing the stormwater runoff area and adding miles of impervious surfaces, our neighborhoods and local roads will experience an increase in flash flooding, which has become more frequent in recent years. I'm also upset about the process under which this project has proceeded without sufficient cooperation from local officials and citizens. Finally, from an economic standpoint, adding additional lanes to the Beltway will only serve to encourage residents of Prince George's and Montgomery County, among other Marylanders, to commute to jobs in Northern Virginia. Why would Maryland make it easier to commute to and encourage growth in Northern Virginia when we should be investing in smart and pro-transit development in our own state? Expanding the Beltway will harm the environment and our quality of life while doing nothing for economic development in our state, and thus I strongly oppose it.

I urge you to oppose expansion of the Beltway as it is a short-sighted project that will cause untold damage to our local communities with little long-term benefit.

Thank you for your consideration.

Jacquelyn Coleman

Subject: NO LUXURY LANES ON I-270/I-495

Gentlemen:

I oppose the project of widening and adding luxury lanes to both I-270 and I-495.

I support the NO-BUILD option.

Thank you,

James and Gail Colen

Darlene Combs

I strongly oppose the widening of 270. Please do not ruin our property values and encourage MORE traffic in our area

Jennifer Combs

I strongly oppose destroying green space and forest canopy for such an ephemeral goal. The small amount of extra car capacity would be immediately overcome by new influx in commuters, as studies have repeatedly shown.

Additionally, toll lanes do not solve the area's actual transport problems but only improve the convenience of the wealthy.

I support no-build.

Linda Comilang

I oppose this project and support the NO BUILD option.

Ashley Conboy

As a lifelong Montgomery County resident that commutes to DC, I find the possibility of expanding 270 to include luxury lanes appalling. We do NOT want to look like Virginia; furthermore, the environmental impact of disturbing trees and other natural habitats if 270 is widened.

Ashley Conboy

I vehemently oppose the I-495 and I-270 project. I support the no build option.

Ashley Conboy

I oppose the toll lanes on I-495 and I-270; I support the no build option

Shannon Conlon

This is an unnecessary, irresponsible project. We should be building public transit and encouraging teleworking, not kicking the can down the road by building more highway lanes and acting surprised when congestion returns to the same levels in just a few years. I support the no build option.

Date/Hearing: 8/25/20

Type/Session: Live/Afternoon

Transcription:

Hi, my name is Matthew Conte (C-O-N-T-E). I live at [REDACTED] Jutland Road, Kensington, Maryland 20895. And this is about a mile or two from 495. Thank you for letting me voice my disapproval of the I-495 & I-270 Managed Lanes proposal and voice my support of the No Build Alternative. These lanes have, do have the potential to provide a small benefit to my family and neighbors by saving us a few minutes if and when we ever returned to our normal commutes. However, it is not clear that the toll road will support itself financially, especially with so many people currently and likely to work from home in the short-term and long-term future. As others have stated, the project takes a very, very iffy bet where the financial and environmental risks far outweigh any potential minor benefits to congestion and commute times. The likely failure of this project would then leave Maryland taxpayers on the hook for decades to come and we would still be right where we are now with our traffic problems. We currently have a public transportation option in the Purple Line that will hopefully be completed soon. It is not clear what impact the Purple Line will have on traffic once it is hopefully completed. A reassessment of the impact the Purple Line on the area's traffic should be studied and it seems necessary to do so before investing tens of billions of dollars in this project. In addition to the environmental impacts, displacement of housing, and many other concerns the fellow citizens have raised, the uncertainty of the current economy further reinforces what a risky proposition this project represents. We should be saving these taxpayer dollars for the likely assistance that our schools, public universities, and many other industries are going to need to [inaudible] the pandemic. Luxury lanes on the Beltway and 270 are not the thing we should be spending our money on. Thank you for your time.

Subject: In opposition to Beltway expansion ("managed lanes")

Lisa Choplin,

Dear Ms. Choplin,

I am vehemently opposed to the plans to expand the beltway and build toll lanes.

What the DMV needs is more transit-oriented solutions, including teleworking (which clearly is possible as we can see from the pandemic shutdown), that reduce greenhouse gas emissions, and reduce sprawl instead of adding more air and water-polluting expensive toll lanes.

Considering the dire nature of the climate crisis and public health crisis we are facing today, adding more air-polluting cars will not solve traffic congestion but instead, exacerbate our existing crises. I ask that you read the Harvard study linking air pollution and higher Covid-19 rates.

The expansion would impose a significant financial risk to people in the region. The Washington Suburban Sanitary Commission (WSSC) earlier this year said that it would take approximately \$2 billion to move all of Montgomery and Prince George's water and sewer systems due to the highway expansion.

Please reject this terrible proposal.

Thank you,
Kristin Cook

David Cooling

I oppose the I-495 and I-270 project. I support the no-build option. Adding additional lanes will increase traffic, increase pollution, exacerbate climate change, destroy historic African American heritage sites, rip up trees, increase travel times, and do absolutely nothing to alleviate congestion.

In light of the failure of the current Purple Line public-private partnership, I encourage a no build option to conserve resources and deploy them in transportation options with higher ROIs that focus on moving people rather than vehicles.

From: Ian Cooper [REDACTED]
Sent: Thursday, October 15, 2020 6:57 PM
To: MLS-NEPA-P3
Subject: I-495/I-270 Luxury Lane Expansion!

I oppose widening and I support the no-build option. I do not support the alternatives that would add lanes to both highways.

Luxury lanes do not ease traffic congestion. Two years in, we'll be looking at more money wasted on road widening. This is a massive boondoggle and an environmental nightmare in the making. We should be making it harder for people to drive polluting cars, not trying to make it easier.

--
Ian Cooper
Rogart Road

Grant Corley

As a resident of Central Maryland, I am opposed to the Governor's plan to expand the Capital Beltway and I-270 with private toll lanes.

We cannot afford this project, which may require a government subsidy of up to \$1 billion, according to a July 2020 report from the Washington Post. It also may lead to a substantial increase -- a near tripling -- in water bills for residents of the region, according to recent report from WAMU. How are we going to pay for all of this additional infrastructure?

Just as important: we cannot afford to continue to encourage sprawl and carbon emissions, which is exactly what these projects do. We are already seeing the effects of climate change, with intensifying storms and flooding in our region. Maryland and Virginia are in the bullseye of rising sea levels, which are only getting started, and are the result of our continued burning of fossil fuels.

If we are going to spend government funds on transportation infrastructure, I want to see the money go to public transportation and developments that encourage walking and transit use. Over the long term, that is going to be more sustainable -- financially, economically, and environmentally -- than more expensive asphalt ringing our state.

Maryland needs to lead on sustainable public infrastructure and planning. Unfortunately, these proposed highway projects are a definite step backwards.

Denyse Corrado

My strong vote is not to widen 270/495, because of the following most important factors: Disrupt wildlife habitat, increase in greenhouse gases, impact a minimum of 1,434 acres of forest canopy (not including wetland trees), adverse effects that will occur on historic properties, will negatively impact 16 Mont. Co. parks and 16 PG Co. parks. In addition, moving water pipes for this project could cost up to \$2 billion dollars, at taxpayers expense. These are just a few of the negative impact factors. Do not widen 270/495. My house and yard will be negatively impacted by this project. I am a 60 year resident of Mont. Co. Please listen and abandon this project. Thank you. Denyse Corrado, [REDACTED] Park View Road, Chevy Chase. MD.

Philip Cotterill

I am outraged by the State of Maryland's actions in ramming down our throats this ill-conceived, misrepresented P3 project that will destroy the neighborhood where I have lived for more than 40 years. The destruction to the amenities that have made Silver Spring and its environs a wonderful place to live is extremely depressing. AND TO WHAT END? To keep up with Virginia (whose highways are a nightmare) – to further the presidential ambitions of this Governor? It's certainly not to provide a 21st century approach to address transportation issues in a world threatened by existential environmental problems.

The proposed I-495 and I-270 beltway expansion draft environmental impact statement ("DEIS") presents incomplete and inadequate analyses, but even the inadequate information presented shows that the project will harm Maryland citizens and their environment and cannot be justified.

Cost and Impacts to Public and Private Property

- Despite promises that the proposed expansion will pay for itself through managed toll lanes, the DEIS shows that the build alternatives might require a state subsidy paid to the developer ranging from \$482 million to more than \$1 billion. This subsidy does not include the billions of taxpayer dollars needed to fund the required relocation of water and sewer infrastructure, nor does it account for the cost of adequate environmental mitigation. No itemized budget has ever been shared and the only one mentioned in the DEIS was a calculation based on lane miles, not one that gave estimated costs for the I-70 bridges to be redone or any specific infrastructure or mitigation costs.
- Counter to project proponents' claims that the proposed expansion would not impact private homes, the DEIS shows that each of the build alternatives would require the government taking and relocating 25-34 homes. It would also destroy hundreds of acres of parkland and historic properties, and would directly affect nearly 1,500 properties.
- The decision to proceed with the project as a progressive pre-development public-private partnership ("P3") hides the project's true monetary and environmental costs and prevents meaningful public engagement until after the DEIS and Final EIS are released. A preferred alternative should not be picked without understanding and analyzing these costs.

Problems with the NEPA Analysis

The DEIS fails to take the required hard look at the human health and environmental impacts of the proposed expansion. It repeatedly excuses cursory reviews by noting that many project details remain unknown. This is insufficient and contrary to the purpose of the National Environmental Policy Act. By failing to appropriately study the available information, the DEIS prevents the public from understanding and commenting on the consequences of the proposed expansion. It will also prevent the U.S. Department of Transportation, Federal Highway Administration and the Maryland Department of Transportation, State Highway Administration from reaching a decision on the proposed project that is based on a complete consideration of environmental impacts and that utilizes all practicable measures to avoid harms.

Name: Barbara Coufal

Joint Public Hearing Date: 8/18/2020

Type/Session: Voicemail/Morning

Transcription:

Hello, my name is Barbara Coufal, C-O-U-F-A-L. I live in Bethesda near Rock Creek Park and the Beltway at [REDACTED] Park Drive in Bethesda. I oppose the project to add private toll lanes to I-495 and I-270. I support a No Build option. I agree with the Maryland-National Capital Park and Planning Commission that the limits of disturbance in the Draft Environmental Statement do not adequately address the likely impacts of the project.

The limits of disturbance in the draft statement are minimized compared with the limits of disturbance shown in earlier maps prepared by the Maryland Department of Transportation because the final design and engineering won't be prepared until a later stage by the private contractor, it appears that the LODs in the draft statement are optimistic. For example, earlier maps showed a much wider limit of disturbance in Rock Creek Park between Rockville Pike and Stony Brook Drive. Previously, MDOT even anticipated that parts of Rock Creek would have to be moved. Since MDOT does not know what the design will be, how can we trust that the limits of disturbance are realistic and the contractors won't widen them. Since the start,

Governor Hogan and MDOT have stated that there would be no costs for taxpayers for the project. Then we learned that it will cost WSSC customers up to two billion dollars to move water and sewer lines. And now the DEIS states that the State will provide subsidies of up to one billion dollars to the contractor. Given the likelihood that there will be more telework in the future, which will reduce traffic and therefore total revenues, it seems likely that the contractor will seek additional subsidies in order to ensure a profit. But the impact of telework is not considered in the DEIS. Finally, I'll comment on the environmental justice review. Appendix P shows that MDOT did not successfully engage environmental justice populations in Prince George's County at any stage of the process. The entire length of the Beltway in Prince George's County borders communities of color and low-income communities, yet attendance by Prince George's County residents was low at public meetings at each stage, compared with Montgomery County. On pages 14, 28, 46, and 47, MDOT shows the number of participants at public events. In total, participation by Prince George's County residents was just one fifth of the participation of Montgomery County residents. MDOT simply failed to engage the environmental justice population in Prince George's County. Thank you.

Subject: Comment on DEIS

Dear Ms. Choplin:

I'm writing to comment on the draft environmental impact statement (DEIS) for the proposal to add private toll lanes to I-495 and I-270. I oppose the project to add toll lanes to these highways and I support the no-build option.

I urge the Maryland Department of Transportation to heed the lessons of the Purple Line P3. Despite lengthy study and preparation, the Purple Line is in disarray because the private partner abandoned the project. MDOT should not rush forward on an even larger P3 before the contractual failure of the P3 for the Purple Line is fully understood.

I agree with the Maryland National Capital Park and Planning Commission that the limits of disturbance in the DEIS do not adequately address the likely impacts of the project. The limits of disturbance (LOD) in the DEIS are minimized compared with the limits of disturbance shown in earlier maps prepared by the Maryland Department of Transportation. Because the final design and engineering won't be prepared until a later stage by the private contractor, it appears that the LODs in the draft statement are not realistic and may significantly understate the ultimate area of disturbance along both highways. For example, earlier MDOT maps showed a much wider limit of disturbance in Rock Creek Park between Rockville Pike and Stoneybrook Drive. Previously, MDOT anticipated that parts of Rock Creek in this area would have to be moved. Since MDOT does not know what the design will be, how can we trust that the limits of disturbance are realistic and that the contractor won't decide to exceed them? Since the vendor will be seeking to minimize construction costs, we cannot count on the vendor to limit disturbance when it is cheaper to expand them.

Since the start, Gov. Hogan and MDOT have stated that there would be no cost to taxpayers for the project. But according to the DEIS, the State will provide a subsidy to the vendor ranging from \$485 million to \$1 billion. Moreover, the DEIS does not include estimates by the Washington Suburban Sanitation Commission that its customers will pay \$1 billion to \$1.8 billion to move water and sewer lines. Nor does the DEIS provide estimates of the cost of moving other utilities buried under the construction zone, including gas, oil and electric lines, internet and cable.

Given the likelihood that there will be more telework in the future, which will reduce traffic and therefore toll revenues, it seems likely that the contractor will seek additional subsidies in order to ensure a profit. But the impact of telework is not considered in the DEIS.

The National Environmental Policy Act (NEPA) requires consideration of how a project impacts Environmental Communities (EJ). The DEIS does not compare the impact of the project on EJ communities with the impact on non-EJ communities, in order to determine whether the negative impacts of a project fall disproportionately on EJ communities.

Nearly the entire stretch of the Beltway in Prince George's County runs through EJ communities. We know that those living near highways are exposed to increased vehicle emissions which have a

harmful impact on health. But the DEIS fails to identify or evaluate how pollutants from increased traffic will impact these communities.

Furthermore, Appendix P shows that MDOT did not successfully engage environmental justice populations in Prince George's County at any stage of the public process. Attendance by Prince George's County residents was low at public meetings at each stage, compared with Montgomery County. On pages 14, 28, 46 and 47, MDOT shows the number of participants at public events. In total, participation by Prince George's County residents was just one-fifth the participation of Montgomery County residents. MDOT simply failed to engage the environmental justice populations in Prince George's County.

The myriad flaws and deficiencies of the DEIS have created substantial uncertainties which put Maryland residents at significant risk if MDOT moves forward on any lane expansion.

Sincerely,

Barbara Coufal

Joe Covey

I am a resident of Rockville and have lived in the Regents Square development for over 40 years. The current I-270 right-of-way borders our community, the sound barrier coming within yards of our houses in some places. I admit I have not read the majority of the voluminous environmental impact report. But a wider I-270, perhaps coming even closer to our townhouses, will create more noise, dust, and fumes. I oppose I-270 options other than reversible lanes built within the existing footprint. I am not sure we can trust government statements that no actual houses will need to be removed. This whole boondoggle also fails to consider the risks of P3s to taxpayers (see the VA Beltway losses and the Purple Line fiasco. It's not even clear if the current traffic projections will apply in a post-COVID world. Please understand my opposition is based more on considerations of need and mechanism than on a knee-jerk NIMBY concern about changes in my neighborhood.

Phil & Judy Covich

My husband, Philip, and I oppose the I-495 and I-270 project and support the no-build option. We have lived in Woodley Gardens, Rockville for almost 50 years. We are close to I-270 and hear the traffic day and night. We dealt with the previous construction and saw how long it took to build and how quickly traffic reached and surpassed earlier levels. That despite all the impact construction had on our neighborhood.

The state's project is backward thinking environmentally. The expansion of roads has been shown both locally and nationally to NOT resolve traffic problems and to cause pollution of air and water and reduction of public green areas.

While focusing on a plan that has proven record of failure the State has sidelined future thinking public transit solutions. Further, it has been pushed through plans without the transparency that the public deserves. We do not know how the contracts are formed and what protections there are for taxpayers and residents. This process has been a travesty on the public and public trust in good government.

We live and work in these neighborhoods that border this highway. We have to use it and know that there are real solutions:

- Telecommuting works and is being utilized on a large scale in real time during the pandemic. Telecommuting a few days a week would contribute to less traffic along with other options.
- Reversible lanes on I-270.
- Rapid transit, commuter bus lanes

I am hopeful that these comments will be taken into consideration in making future decisions regarding this project.

Respectfully,
Judith R. Covich
10.19.20

David Cowles

I oppose this project and support the NO-BUILD option. I do not support for profit toll lanes that benefit the wealthy.

Kenneth Crager

I fully oppose the plan. Countless studies indicate the only way to reduce traffic congestion are to improve mass transit and bicycle access/safety. Increasing the number of lanes, especially when those lanes are pay-to-use, only make things worse.

Instead of spending \$11 billion on expanding I-270 and I-495, let's instead build and maintain protected bicycle lanes throughout the area to encourage people to cycle to work. This will have far less impact on the environment, reduce traffic congestion, decrease air and water pollution, eliminate the need to exercise eminent domain, and make the population healthier overall. I would rather bike an hour to/from work in the Capitol, than sit in traffic (regardless of the cause, e.g. construction, collisions, etc.). As a cyclist, I would rather feel safe on the state and local roads than lose 25% of my property and watch as our parks and forests are destroyed during construction.

Please do not move forward with the interstate expansions. Instead, explore using this money to improve bicycle and mass transit infrastructure. Thank you.

To: MLS-NEPA-P3
Subject: DEIS

Having observed the increasing traffic congestion approaching the American Legion Bridge,, I think improving the bridge with perhaps two decks, or an additional span, should be a priority. Maybe have an Easy Pass toll option for using the bridge.

As for adding toll lanes on I270 and expanding the highway this seems to be a 20th century solution not a 21st century solution. More lanes bring more cars, more noise and more air pollution. Destroying forests and reducing parkland space would add to the environmental damage.

Also, the huge cost should really be taken into account at a time when even funding for the Purple Line seems in jeopardy. We need to think about public transportation options used in Europe and Japan such bullet trains which are quiet and don't contaminate the air. Failing that, even more non-stop buses might help.

Louise Crissman [REDACTED]
Bethesda, MD 20817

Jacqueline Crocetta

I oppose the I-495 and I-270 project. I support the no-build option. A preferred alternative should not be chosen until the true monetary and environmental costs are known.

My home is located about two blocks away from I-270, and one block away from Bullards Park, on the corner of Roxboro Road and Adclare. I have lived here since 2002. The noise from I-270 is already so loud that, at times, it wakes me in the middle of the night. I'm deeply concerned that I will not be able to tolerate an increase in noise pollution due to construction and additional lanes of traffic. Exposure to loud noise increases risk for sleep disturbances, heart disease, stress and hearing loss and I am already suffering from some of those health issues.

I'm concerned about the 1,500 acres of forest canopy that would be lost trees that help clean the air, reduce noise, filter water, and are integral to storm management, among other benefits. An increase in air pollution is another one of my concerns. This will have an especially negative impact (increased risk of asthma and lung infections) on everyone living close to I-270 and I-495, as well as students attending outdoor gym class and team sports at Julius West Middle School (and other schools close to I-270 and I-495), and families frequenting Bullards Park, as well as other parks close to the project. The project would harm more than 130 acres of park lands.

An increase in impervious surfaces will exacerbate flash flooding incidents, erode stream banks, and lead to more stream pollution (gasoline, fertilizers, etc.) and a more polluted Chesapeake Bay. The proposed widening of I-270 and I-495 would add 550 acres of impervious surfaces to the region. My studio is located in an industrial area of Kensington, Maryland, overlooking Rock Creek Park, near Beach Drive. I have worked at this location for eight years. Recently, we have experienced higher rates of flash flooding in the area and the depth of water on roads has increased. If flash flood incidents and the volume of water continue to increase, there will be more stream damage and pollution, and more roads will become impassable and dangerous.

The DEIS was created pre-COVID and doesn't consider the substantial increase in telecommuting since the pandemic. Global Workplace Analytics estimates that 25% 30% of the workforce will be working-from-home multiple days a week by the end of 2021.

Additionally, the economic crisis is another reason I support the no-build option. The price tag for the project is estimated to be about \$10 billion, plus \$2 billion to move water and sewer pipes. The proposed public-private partnership is a business model that has failed around the globe, putting tax payers at risk of footing the bill. It would be fiscally irresponsible to go down this path.

I'm also opposed to the I-270/I-495 widening project because there has been no environmental justice review. The historic Moses Morningstar Cemetery is threatened by this project.

Thank you for your consideration.

Sincerely,

Jacqueline Crocetta

To: MLS-NEPA-P3
Subject: Capitol Beltway and I95 expansion project.

TWIMC,

The impact study and alternative approaches is highly flawed.

1. Improvement of Legion bridge is needed; but we need more major bridges between Legion Bridge and Point of Rocks bridge.
2. After additional bridges built, then connect MD 200.

Observations:

1. A solution that works with Virginia is needed to connect and make an outer beltway with multiple crossing bridges (North and South).
2. The traffic congestion is mainly due to the amount of traffic that funnels from I270, I66, and Dulles Access onto the beltway because there is no alternative ways to cross the Potomac.
3. Again, as done in the 1950's, Montgomery County, with its wealthy elite and the Virginia side of Great Falls, want to see all citizens treated badly by blocking bridges and new highways.
4. As usual, nothing good comes from studies where the obvious solution is ignored in favor of the most costly and punitive solution.
5. It should be noticed that MD 200 was done and has little traffic because there was no funneling relief needed due to industrial demand between PG county and Montgomery County. Whereas the Rockville and Northern Virginia industrial demand is big and the cost of homes / taxes between MD and VA are significantly different.

Conclusions:

1. Do nothing until MD and VA both decide to act in concert.
2. Do not repeat the 1950's mistakes where VA built a 2-lane beltway and Montgomery County elites forced a 3-lane ROLLER COASTER beltway in their section.
3. More Bridges, highways, and an Outer Beltway are needed!
4. Stop wasting money on pointless surveys when real solutions are not being examined.

Sandra Crowe

Given the reduced traffic volume as a result of COVID, the need for traffic remediation and I 270 expansion is no longer necessary. Many people will continue working from home and traffic congestion even after COVID will be diminished. Let's not spend our tax dollars or private money on something that is no longer necessary.

Sandra Crowe

Please do not widen 270. Now that people are teleworking and will continue to telework traffic is much lighter and widening is not necessary nor will it be in the future. This is not a project we need to take on.

Josephine Cruz

I oppose this project and support the NO-BUILD option

Subject: I-495/I-270 Luxury Lane Expansion

Dear MDOT.Maryland,

I am opposed to the Lane Expansion mentioned above. If it goes ahead, it would cause upheaval among neighborhoods, with people losing their homes, and the same would happen to countless other inhabitants, including birds and animals that will lose their habitats. This is unethical and unacceptable. Though driving has become more desirable under COVID, the long term use of public transportation is where we should be investing scarce public dollars. Another side effect of Covid will be more people working remotely, so more lanes will become less and less useful. There is no need for this expensive project that will ruin lives.

Sincerely,

Laurette Cucuzza

To whom it may concern

I'm using time I don't really have. To let you know how incredibly narrow minded, short term focused and irresponsible I think this project is.

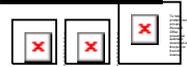

- Especially NOW (Not that it wasn't before) that Covid is very likely going to re-shape the way we work and commute in suburban America.
- Especially now, that an environmental crisis is upon us and we should be pushing more efficient ways of transportation
- Especially now, that we've seen so many other similar projects fail across the country (and the world)
- Especially now that there's so much pain out there and we're going to use our money more wisely than ever.

Hope you listen to the voices of the citizens

Thanks

Alfonso Cuesta

You are going to need an agency like this.

Katherine Culliton-Gonzalez

I am completely against the beltway widening. I live in the area and have a family of 5. We are a Latino family and believe we would be disparately impacted. Other families not so lucky as us would be hit even harder. My husband works in construction and he is also against the widening because it would not help his commute and he might not be able to afford the private lanes. Further, we are against the obvious increase in air and noise pollution, the walkability of our neighborhood, and our neighbors losing their homes. We moved to Silver Spring because it has great PUBLIC transportation. I take METRO to work and our older sons use public transportation as well. We don't need additional investment in cars and private partnerships, but instead we need more public transportation.

Gary Cummings

Widen 270 from Clarksburg to Frederick. It should be four lanes in each direction. There is bumper to bumper traffic barely moving even on Saturdays and Sundays. Time to widen it both ways. Don't waste time and money on more mass transit.

Name: Kara Cunzeman

Joint Public Hearing Date: 9/3/2020

Type/Session: Live Testimony/Afternoon

Transcription:

Hello, my name is Kara K-A-R-A, C-U-N-Z-E-M-A-N. I live at [REDACTED] Cypress Grove Lane in Cabin John, Maryland. Thank you for providing me an opportunity to express my concerns today about the 495 270 expansion. I appreciate your full attention in these three minutes. The highway expansion, as proposed, is continuing to encourage 20th century transportation. A hundred years later, and we are still proposing more lanes and little other solutions to fix congestion issues. I view this proposal as a complete failure of innovation of our government. There have been numerous studies citing that expansions don't really solve the problem in the long run. What we should be focused on is a more comprehensive approach to alleviating congestion, helping reduce the impact on the environment, and providing cost effective and diverse solutions that can uplift our communities and personal lives. How might clean energy, autonomous vehicles, public transportation, and telecommuting play into a more holistic addressing of the problem at hand? Are there ways we can incentivize employers, for example, at more telecommuting, giving the ongoing situation with the pandemic? The current plan, if we are lucky, if the 5 to 10 year fix and those in office making decisions today won't have to face the realities of the near future, that we aren't really addressing the root of the problem. The world is moving towards clean energy. We know climate change is an issue, and what do we create? More lanes. What messages are we sending to our kids by encouraging and worsening behavior we know is not playing well for our planet. Where is the leadership? We are also concerned that such models have been used with data that it is two over two decades old. They do not accurately reflect today's conditions, let alone account for the disruptions we are experiencing today from the pandemic that could totally change the future outlook. In what world are important decisions made with data over 20 years old? In addition, we expect real answers to how the pandemic might change outcomes of an initial study. Perhaps it's a new opportunity for us to reevaluate our activities and incentivize meaningful changes. Without answers to these questions, how can we [INAUDIBLE] project that is going to cost the taxpayer millions of dollars? I'll move on to my last point. I live in the Evergreen community in Cabin John, and we will be gravely impacted by the expansion. We are glad to see the construction of the noise barriers included in the plan, but we are really concerned about the extensive and enduring disturbance. We asked that a more detailed plan be put together that mitigates negative consequences to our properties, local wildlife, and the environment, during and after construction. Thank you again for your time and consideration. We look forward to having the community's concerns addressed in the team's revision.

Beltway widening will promote climate change. Better to get cars off the road than to put more on it.

From: Paul Daisey [REDACTED]
Sent: Sunday, November 8, 2020 7:08 PM
To: MLS-NEPA-P3; akase@marylandtaxes.gov; treasurer@treasurer.state.md.us
Subject: Comments on the I-495 and I-270 Tollway Expansion

My name is Paul Daisey. I grew up in Four Corners (which Rt 29 expansion ruined), spending childhood summers in the Silver Spring YMCA.

I graduated from Northwood High School in 1968. Except for time away for higher education (BA Sociology, BS Business, MBA Finance), I am a lifetime Montgomery County resident. I have lived in Colesville at [REDACTED] Overton Lane, Silver Spring MD 20904 for the last 34 years. I am also a lifetime bicyclist, contributed to the 1978, 2005, and 2018 Montgomery County Bicycle Master Plans, and served on the Maryland SHA Bicycle Advisory Committee.

Bottom line up front: I oppose widening I495 and I270 and support the no-build option. Based on my one-year experience as an Urban and Regional Planning master's degree student at GW, I think the other alternatives are incomplete yesteryear designs based on past economic conditions and planning models.

The DEIS acknowledges that the project will lead to increased air pollution and additional impervious surfaces, increasing storm water runoff and water pollution, negatively impacting local streams, creeks, rivers, wetlands, parks, trails, recreation facilities and wildlife. It will entail the loss of both public parkland and private facilities like the Silver Spring YMCA that currently contribute to the quality of life in Silver Spring. For what?

Building more highways has been demonstrated to create more traffic congestion through induced demand. The DEIS finds that in many cases the Managed Lanes perform only marginally better than the General Purpose Lanes; in some stretches they perform worse, and the General Purpose Lanes suffer worse congestion in most segments. The dramatic reduction of traffic volumes this year due to the Covid 19 pandemic as more people work from home and rely on home delivery instead of in person shopping throws into doubt the forecasts of future motor vehicle traffic on which this project justification is based.

The collapse of the Purple Line construction project demonstrates Maryland's inability to accurately estimate transportation infrastructure costs or to successfully manage cost effective public / private partnership projects. The proposed project will require billions of additional public dollars to move water and sewer lines, to provide adequate environmental mitigation, and to subsidize the developer. I do not want my tax dollars used for those purposes if there is a better alternative. I think there is.

Start over. Read Thrive Montgomery 2050 so you recognize the future opportunities and challenges we face. Envision a new solution. Support smart growth for a more urban future. Plan to address climate change and other environmental impacts. Plan on carbon taxes. Use congestion pricing. Use incentives for tele-work. Plan on less and more expensive parking, except for commuter lots. Plan detailed interconnections with existing transportation infrastructure to increase multi-modal transportation alternatives integrating bus and rail mass transit and bicycle, scooter, and pedestrian self transit facilities. Plan to spend taxpayer money wisely.

Attachments: COMMENTS ON PROPOSED EXPANSION OF I.docx

See attached comments.

COMMENTS ON PROPOSED EXPANSION OF I-495 AND I-270 IN MANAGED LANE STUDY

My comments will not cover the potential environmental impacts to communities, parklands and cultural resources from the proposed expansion of Maryland's two major interstate highways. Negative impacts to all three have been addressed by many individuals and organizations. What I would like to address is the other side of the equation. And this would be the premise on which the 10+ billion dollar expansion is based. The first premise is that traffic will continue to increase in the DC metro area at a steady if not exponential rate and the second is that major road building projects are the most viable solutions to easing traffic gridlock in the region. I think both of these premises should be questioned and reconsidered.

The coronavirus will cause some permanent changes in the way we live, work and travel about after immunization shots are available. One long lasting change could very well be the number of daily commuters driving to and from their offices. More and more employers are discovering that their operations have not suffered in productivity and efficiency when staff worked from home. Conducting operations from a central office may no longer be necessary for many employers. Why carry the high overhead expense of a central office when productivity can be maintained and sometimes increased from moving online. An example of this new mode of operating is the national coop retailer REI, headquartered in the Seattle area. REI's brand new and unused corporate headquarters in Bellevue, WA. is now up for sale. Seven months of successful on line operations convinced the retailer that shouldering the cost of brand new corporate headquarters is an expense they could avoid. So post pandemic traffic patterns may need to be rethought. Other factors reducing vehicle trips can come from how individual households have been navigating during the pandemic. Many if not most household purchases have been made on line. With stores closed and many households in quarantine, traffic almost disappeared from County streets during the spring months. Even after a coronavirus vaccine is available, you need to question how many vehicle trips to stores will be replaced by on line orders. There is even a question of how many stores will still be operating once the pandemic is over. There may well be a permanent reduction in occupied office and retail space.

The second premise that should be rethought is why major road construction or expansion projects are the necessary antidote to traffic gridlock. Rather than spending tens of BILLIONS of dollars adding toll lanes to I-495 and I-270 why not consider spending only tens of MILLIONS on solving hundreds of MD traffic bottlenecks in in the DC metro area. If one of the most densely populated places on earth can effectively and efficiently move its traffic through city streets than surely MDOT can do the same. Hong Kong with a population of almost 8 million (2 million more than the DC metro area) occupies 1,000 square miles, one fourth of DC's 4,000 square mile area. And the City is a master at keeping its traffic flowing with a minimum of gridlock. Rather than spending billions on expanding the lanes on two MD interstates why not spend millions on solving traffic bottlenecks on State and County roads in the region. I live off MacArthur Blvd. near the DC line. On four miles of MacArthur from DC north to Cabin John there are three traffic bottlenecks. During pre-pandemic times these bottlenecks often added an additional 10 minutes to the four mile drive. There use to be 4 bottlenecks on this stretch of MacArthur but one was fixed by a simple and effective solution. The improvement was made by creating a left turn lane onto Wilson just a couple yards after exiting a one lane bridge. Traffic during rush hours no longer gets stuck on the bridge behind cars trying to turn left onto Wilson Lane. Spending tens of millions on correcting these traffic gridlock points rather than tens of billions an adding lanes to two interstate highways with negative environmental impacts on communities, parkland, and cultural resources may be a better use of State and County funds.

Ms. Lisa B. Choplin, DBIA Director I-495 & I-270 P3 Office
Maryland Department of Transportation, State Highway Administration
707 North Calvert Street
Mail Stop P-606
Baltimore MD, 21201

Dear Ms. Choplin,

I am writing to comment on the proposer 495/270 project. My wife and I have lived in Cabin John for 25 years and we have seen the side effects of local growth first hand. I has not been for the better.

The biggest change we have seen is the increase in noise. It used to be we could hear 495 in the winter when the leaves were off the trees, now we hear it constantly. Sound walls will not help us as we live six tenths of a mile from 495. We also get a disproportionate amount of aircraft noise, which while it is outside your scope exacerbates the noise problem. How will you mitigate the increase in noise?

We are also concerned about air quality, my wife and two of our three children have repertory issues attributed to 'pollution'. How will you mitigate the decrease in air quality?

Cabin John is at a crossroads and we bear a disproportionate commuter traffic burden. Drivers use the primary streets in our neighborhood to circumvent traffic when 495 is congested. If there is an incident all hell breaks loose. We get gridlock and cars speeding down tertiary streets searching for a short cut. Putting more cars on 495 will not help this. How can you ensure emergency response vehicles can make it through the gridlock?

The economics of the public private partnership seem lopsided to me. Why should commuters be forced to pay tolls that enrich private companies because the State and Local Governments have FAILED to do their job? Yes, you should have been arranging funding for this type of work for years. At very least the partnership should end and revert back to public ownership at the time the private investment has been repaid, then no more tolls.

In general this seems like a mis-guided band aid to the big issue. Why do people have to drive from Leesburg through Bethesda to get to Frederick? What you should be building is more river crossings further out from 495. Has this been considered?

My personal issues above, combined with the impact on parks (32 negatively affected) homes and the potential for a Two Billion dollar bill to move WSSC Water lines make me support the No Build Alternative. We need and deserve a better solution. Thanks you for your consideration. I remain,

Sincerely,

Travers Daniel

Helen Darby

Absolutely OPPOSED. This is one of several mechanisms to move MD towards privatization of our roadways.

Miki Darling

I am a family physician who lives very close to the west sound wall of 270. I do NOT support the proposed expansion of 270/495 and support instead a NO BUILD or mass transit option. Although our house would probably be spared if 270 was widened, we would suffer from the effects of increased traffic noise and air pollution should the project proceed. The last widening of 270 was helpful for only 8 years before traffic again became just as congested as before. MDOT SHA must evaluate additional alternatives for detailed study including public transit, Transportation Demand Management telecommuting, that weren't considered in depth. Given the pandemic, it is unknown whether traffic will even return to previous levels given the increase in people realizing they can work from home very well. Also, financially it seems very unwise to commit vast sums of money given the uncertain financial future of states and counties. And, yes, I realize that this is a P3 and supposedly it wasn't supposed to cost the state anything but it has since become clear that the state and or county will end up needing to pay a significant amount of money for the project to be carried out. There is data in the medical literature that living in proximity to a major highway increases ones risk of heart disease most likely due to the heavy metals in the air pollution. Expanding these roads would only put more individuals at risk. Again, I do not support the proposed widening of 270/495 and support instead a no build option. I hope that more consideration will be given to those options.

Objections to Draft Environmental Impact Statement for Proposed I-495 and I-270 Toll Lanes Expansion

From: Liz Davenport, [REDACTED] Dartmouth Ave., Silver Spring, MD 20910

Date: October 17, 2020

Beltway Expansion Could Forever Fragment Ecosystem Services of Trees and Tree Canopy in I-495 Construction Zone Impacting Silver Spring and Adjoining Neighborhoods

Thank you for inviting public comments on the draft Environmental Impact Statement (DEIS) for the Maryland I-495 and I-270 toll lanes. The objections outlined are supported by research sponsored by Maryland or Montgomery County (see Addendum). The objections are consistent with those of the MNCPPC to the DEIS, which said that removal of public and private properties for Beltway expansion would need adequate planning for storm water management and protection of the environment in or near construction zones to keep area parks whole. These objections argue that the projected reach and scale of impact from construction in Silver Spring zone will be greater than that described by MNCPPC.

The DEIS begins its analysis using incorrect assumptions. Its baseline fails to take into account the impact of the recent clearcutting of trees and mature tree canopy for the Purple Line construction zone. The foregone economic and environmental benefits of those removed trees have not been mitigated under County Forest Conservation Law, and their replacement value will never be completely regained. The DEIS for Beltway expansion should therefore revise its baseline for analysis with an accommodation made for that zone. If toll lane construction proceeds, based on faulty analysis, an especially vulnerable segment of the 9.1 mile Sligo Creek, will be deeply impacted. A realistic baseline for the DEIS that accommodates the Purple Line-created tree deficit will more accurately determine how Beltway construction fragmentation of tree canopy could permanently change the watershed ecosystem.

Maryland and Montgomery County Research Validates These Objections

As home to environmentalist Rachel Carson, Silver Spring epitomizes “green” planning (see May 2010 *Silver Spring Green Space Guidelines*). Friends of Sligo Creek, Silver Spring neighborhood associations, local Sierra Club, Chesapeake Bay Foundation, government leaders and staff, and others have worked to improve stormwater management, air and water quality, and wildlife habitat for biodiversity. County Planning, in its Silver Spring and Adjoining Neighborhood Master Plan process, shared with this highly diverse community the impacts of likely population growth County-wide in the next 30 years requiring more middle income, multi-family housing, and expected extreme weather affecting temperatures, rainfall, and flooding. Both pressures will stress the health and functionality of this urban watershed.

County planners advocate parks to attract business investors and home buyers, given how parks increase property values. Silver Spring’s largest is Sligo Creek Park, described as heavily used, especially during the pandemic. When and if the Purple Line is done, the Dale Drive Station could likely increase the use of Sligo Creek Park. The Park itself is a narrow buffer for Sligo Creek; the true buffer includes the extended canopy of mature trees in adjoining Silver Spring neighborhoods. Preserving the extended canopy is critical to the people and wildlife that depend on it. The County’s strategic plan, *Thrive 2050*, in its *Issues Report* says experiencing nature—parks, gardens, trees, small landscapes, and natural areas—is important to human functioning, health, and well-being. Tree cover and integration of green space directly impact physical and mental health of residents. The *Thrive 2050 Issues Explainer* clarifies

that creating a healthy and sustainable environment means supporting our natural ecosystem, animal habitats, and human health.

Silver Spring's shade trees (many recently removed) and mature tree canopy are critical to the city's future livability. A tree canopy forms a "commons" of thousands of living organisms interconnected above ground and in fungal networks below, which maintain the health of the forest ecosystem anchored by virtually irreplaceable heritage trees. If nurtured, this urban riparian forest will continue to provide shade, buffer wind, and noise, create safe harbor for wildlife, and improve human health. To address declining urban water quality from the loss of trees and forests, the County must grow in a way that protects and improves the health of the natural environment. In a key role, trees aid stormwater runoff through evapotranspiration, a service that otherwise that must be replaced at great expense.

The County Planning Board in June 2020 voted to consider expansion of Silver Spring's commercial and residential zoning into single family zones to enable multi-family housing. Under current law, it is a tossup whether existing trees and tree canopy might be preserved, or lost, lot by lot, in a gradual removal of mature trees. County's 2013 "no net loss" of trees policy allows planting a sapling outside the region as mitigation for tree loss. To its credit, the County is seeking input on amending the Forest Conservation law to include "no net loss" of tree canopy. County Planning in its Silver Spring Master Plan update is getting strong stakeholder feedback to preserve existing mature trees and tree canopy to protect benefits already provided, and where needed, plant additional new trees.

Unfortunately, Downtown Silver Spring lacks sufficient shade, even though adjoining neighborhoods are beloved for beautiful mature trees that connect to Sligo Creek Park. In 2011, the University of Vermont study of 17 Montgomery County sites determined that Downtown Silver Spring was the 3rd worst urban heat island in the County with only 14% shade. The County's *Commercial Residential Zoning Guidelines* strongly recommends preserving trees, tree canopy, and planting street trees to reduce urban heat island effects, as well as using rooftop and cascade gardens. The County's *Shades of Green Program* responded by planting a total of 30 shade trees within the downtowns of Silver Spring or Wheaton. Sligo Park Hills recently secured the County to plant 67 trees in key locations in the watershed. Demand for trees has always seemed greater than the County's ability to supply them. These County plantings are laudable but cannot compare with the inherent value of preserving existing trees and tree canopy.

To accurately assess Beltway expansion impacts, the DEIS must reset its baseline by including recent clearcutting of trees and tree canopy in Silver Spring. An accurate baseline for analyzing the impacts of Beltway construction is critical, given expected climate change impacts that could be the tipping point for permanent degradation of the riparian forest...essential to Silver Spring's success. The economic and environmental wealth of these trees is what Maryland's *Clean Water Blueprint* demands to sustain the health of local waters and the Chesapeake Bay in its commitment to "reverse forest loss." The value of trees lost (Purple Line and Silver Spring Beltway construction) can be calculated using *USDA i-Tree* tools to quantify how and where these trees would add social, economic, and environmental benefits. For example, EACH RED MAPLE NOT CLEARCUT for Beltway expansion over 20 years of its life would:

- Remove 3,100 lbs. carbon dioxide from the atmosphere.
- Reduce 5,500 lbs. carbon dioxide emissions and 30 lbs. air pollution from a power plant.
- Save 570 kWh of electricity and 20 MMbtu of fuel for cooling and heating.
- Intercept 27,000 gallons of rainfall and 4,800 gallons of runoff.
- Filter 15 lbs. ozone, nitrogen dioxide, and sulfur dioxide from air breathed.

Protecting tree canopy is a proven market force with a calculable return on investment. In a *New York City Municipal Forest Resource Analysis, April 2007*, it was reported that city-wide, the average street tree intercepted 1462 gallons of stormwater each year, at a value of \$61 per tree, for a total savings of \$35.6 million each year.

In June, 2014, Virginia Tech University reported that best management practices for land use in the Chesapeake Bay watershed included conservation and maintenance of existing tree canopy to reduce future pollutant loads by reducing the loss of tree canopy. The report said that tree canopy can have a greater positive impact on local efforts and actions to address water quality than tree planting alone. The report recommended a cost-benefit analysis of planting trees be done to compare benefits of tree conservation. Similarly, the *Chesapeake Bay Program, Tree Canopy Outcome Management Strategy, 2015-2025*, says tree canopy needs must be assessed and a green infrastructure plan developed to protect remaining natural resources and riparian forest buffers in urban and suburban areas.

County Planning assesses tree value based on needed percentage of tree canopy; requirement for number of trees of a certain diameter and height and species; or tree basal area. *County Zoning Ordinance Citation, Section 4.7.3.F. Protection and Enhancement of the Natural Environment* states: "Protection and enhancement of natural systems, and reduced energy consumption help mitigate or reverse environmental impacts, such as heat island effects from the built environment, inadequate carbon sequestration, habitat and agricultural land loss, and air and water pollution caused by reliance on the automobile." Development plans receive points for protection, restoration, or enhancement of natural habitats, on-site or within the same local watershed, in addition to Forest Conservation Law or other requirements, and for protecting canopy at least 15 years old, amid other considerations.

Virginia's Prince William Forest National Park offers a cautionary tale. Its brochure tells how this secondary growth forest protects the last bastion of rapidly disappearing Piedmont habitat. It describes how forest loss in surrounding suburbs means that many bird species, like the Pileated Woodpecker and Scarlet Tanager, are now only seen in the National Park. Yet, in the Sligo Creek watershed, these species are regular backyard visitors. Sligo Creek Park should make the Bald Eagle photographed at Dartmouth and Dale in March 2020 the iconic, aspirational barometer for expected biodiversity in 2040 and beyond.

In summary, the scope of impacts to trees and tree canopy and the watershed ecosystem is exacerbated by climate change's projected impacts on our lives and the environment: extreme temperatures, extreme weather events, and more. The County must reduce our greenhouse gas emissions and prepare for these impacts. The *2018 Emergency Montgomery County Climate Change Mobilization Task Force Report* calls for "massive tree planting in the County by virtually every property owner to combat Climate Change." The DEIS must account for climate change as it researches impacts of Beltway expansion, resetting its baseline for trees and tree canopy deficits created by Purple Line construction in Silver Spring and adjoining neighborhoods. Some of Silver Spring's trees and tree canopy may be lost, but must not be forgotten by those who govern. In that vein, the DEIS must accurately assess this watershed ecosystem to ensure the right decisions are made for Silver Spring to thrive in 2050.

Wicca Davidson

██████████ Connecticut Avenue
Chevy Chase, MD
20815

28 August 2020

To whom it may concern:

My husband and I live on the corner of Connecticut Avenue and Leland, in the Town of Chevy Chase, 3 blocks south of East-West Highway.

We have lived here since 1998, so therefore have many years of experience living on 185 – a loud and active six lane highway.

Living here has been interesting.

There are accidents 3-4 times a year in front of our house, many of them quite serious.

There is never a time of day that traffic is gone, or Connecticut Avenue is quiet. It is impossible to have any quiet or private enjoyment of our large corner lot.

To give you some context to my comments - I am a full-time real estate agent who has worked for 20+ years in the metro DC area. Our updated 3000 square foot house, with a .40 acre beautifully landscaped lot, is worth approximately \$200,000.00 less than an equivalent house and lot in the Town that is on a quiet street. In fact, the smaller house next to ours on Leland, is - per square feet - worth more than ours.

Our house is approximately a mile from the site of the new Purple Line stop on Connecticut Ave. That will bring even more traffic.

The current plans I am sending in our comments regarding - inform me that you are planning on sending even MORE traffic down Connecticut Avenue.

Connecticut Avenue is one of DC's main arteries that runs from Virginia, through the District of Columbia, and onto the beltway in Maryland. Please consider the quality of life for those of us who already have a life compromised enough by the current state of the Avenue, and who will someday soon be dealing with the metro stop which is walking distance from our home.

Please, spare us and do not make the Connecticut Ave exits from 495 handle substantially more lanes of traffic, which will invariably lead to more noise, more congestion, even lower property values, and more accidents. Your plan is a bad one and will impact many more people than our family.

Sincerely,

Wicca Davidson

From Appendix B pg 148: "The construction costs used in the financial analysis were adjusted to reflect assumed efficiencies in costs for major items such as asphalt pavement and structural materials."

How were "adjustments" decided here? And what were the details of those adjustments? The document fails to describe these or how they were decided, calculated or even estimated.

Comments on the Draft Environmental Impact Statement for the I-495/I-270 Managed Lane Study August – September, 2020

For the last 25 years, I have lived in Rockville – a little over a mile from I-270 – where I raised my children. One of my daughters and her children live in Rockville, the other in Silver Spring near I-495. As a citizen, a taxpayer and a user of Maryland’s highways, I am deeply concerned by MDOT’s failure to address crucial issues of cost, effectiveness, and community and environmental impact in the DEIS.

I support the no-build option and oppose all of the options to widen I-270 and I-495.

As a regular user of both I-270 and Metro trains and buses, I am concerned that P3 tollways will increase congestion on I-270 and feeder roads such as MD-28.

I am further concerned that the proposed tollways will increase economic disparity in our region, which has already been worsened by the Covid-19 pandemic, and effectively punish lower-income essential workers (many of whom are minorities) who must use their cars to get to work but are unable to pay high tolls. This concern is heightened by MDOT’s conclusion that managed lanes will benefit minority and low-income communities without conducting any analysis of the impact of toll roads on these communities. This violates [Federal laws](#) and common sense notions of fairness and decency.

The Purpose and Need Statement for the Managed Lane Study is so narrow that it precludes any consideration of reasonable alternatives, contrary to Federal court decisions. By focusing myopically on expansion of toll roads, and by segmenting the study to exclude I-270 Managed lanes from I-370 to I-70, MDOT has failed to give fair and proper consideration to alternatives such as expanding MARC service and/or rapid bus lanes that would provide cheaper and fairer transportation to all residents of the I-270 corridor.

One of my grandchildren has asthma. I am very concerned about the health impact of increased pollution from I-270 and feeder roads on my family and other vulnerable people in my community. The heavy toll that Covid-19 has taken on people with respiratory problems in our community should make us even more concerned about increasing the amount and concentration of harmful emissions near residential areas.

I also oppose the expansion of I-495 into Rock Creek, Sligo Creek, and Greenbelt parks which will adversely affect wildlife and recreation. These are the parks that my grandchildren play in. The damage to our local parks and quality of life cannot be mitigated by acquiring land in other parts of the state.

Finally, the proposed widening of I-495 and I-270 is likely to be a disaster for taxpayers, at a time when our state and county treasuries are already stressed by the pandemic. The proposal as it stands will cost taxpayers a billion dollars directly, plus another two billion in water and sewer fees for pipeline relocation. And as the Purple Line debacle has shown, we could end up on the hook for billions more. This is money that could much better be invested in improving public transportation options for lower income workers and other critical needs in our communities.

Re: I-495 and I-270 Expansion Draft Environmental Impact Statement

Via First Class Mail, and via email to
MLS-NEPA-P3@mdot.maryland.gov

Dear Ms. Choplin:

This is to provide my comments on the above referenced draft environmental impact statement. For the reasons stated below, I oppose this project and support the No-Build option.

I reside in Potomac Maryland, about three miles distant from the Capital Beltway (I-495). I've lived here since 1987 at the address above. For approximately 25 years I commuted to my law office in Arlington, VA, usually via the Clara Barton Parkway in the mornings and via the George Washington Parkway and the American Legion Bridge in the evenings. I am all too familiar with the traffic congestion on these routes. If I'd known in 1987 that I would accept employment in Arlington, I would probably have bought a house there. But, my wife and I are happy where we live now, and we'd like to keep it that way.

My opposition to the proposed expansion of I-495 and I-270 is grounded on three considerations that the draft environmental impact statement failed adequately to address: (1) the climate crisis, and the urgency of curtailing the CO₂ emissions that cause global warming; (2) the "build it and they will come" phenomenon known as induced demand; and (3) increased opportunities to work from home, which have accelerated dramatically in recent days due to improvement in technology (e.g., Zoom) and the need for social distancing due to the coronavirus.

The Climate Crisis

The UN Intergovernmental Panel on Climate Change (IPCC) has determined that, if we are to avoid the worst effects of global warming and climate change, the world's economies must become carbon neutral by 2050. To achieve carbon neutrality, people need to stop burning fossil fuels for energy. Studies have shown that transportation in single passenger motor vehicles often has the largest impact on personal carbon footprints. For this reason, Montgomery County is working on a smart growth plan that concentrates future development along transportation corridors and encourages urban villages where people live near their offices, grocery stores, restaurants and other amenities. To develop our economy in a way that saves the planet, we don't need more roads; we need efficient public transportation and smarter development policies. Mid-twentieth century thinking (more roads and suburban sprawl) won't enable us to cope with the twenty-first century climate crisis.

Induced Demand

Induced demand is the name for the phenomenon that occurs when the opening of a new road, or the widening of an existing one, generates new traffic that causes the new road or new lanes quickly to fill up. Based on personal experience, the proposed I-495 and I-270 project is likely to have this effect. Having for years experienced the traffic these roads, I now use them judiciously, planning my trips for times when the congestion won't be too bad. Google Maps helps me do this. If the roads were widened, I'd use them more often – until the traffic gets bad again because more people like me decide to use the roads more frequently. If the proposed project goes forward, the new lanes will attract additional traffic, and we'll have back-ups on eight or ten lanes instead of six or eight. We'll have the same delays we do now, but we'll also have more CO₂ emissions, more ground level ozone, more pollution, and a diminished quality of life.

Working from Home.

The COVID-19 pandemic has been called “a massive experiment in telecommuting.”¹ Out of necessity, telecommuting has become increasingly common, and the practice is likely to continue after the pandemic abates. New computer applications like Zoom and Microsoft Teams facilitate virtual meetings where people collaborate much like they did in offices. A friend who is a manager at the Department of Commerce tells me that his team has been more effective now that everyone is working from home. The workers accomplish their tasks without wasting time or emitting CO₂ and pollution while commuting to work. The draft environmental impact statement failed adequately to address this paradigm shift in working practices.

¹ www.brookings.edu/blog/up-front/2020/04/06/telecommuting-will-likely-continue-long-after-the-pandemic/

Conclusion

Maryland should choose the No-Build option.

Sincerely yours,

A handwritten signature in black ink that reads "James Bruce Davis". The signature is written in a cursive style with a large initial "J" and a long, sweeping underline.

James Bruce Davis

cc: The Honorable Peter Franchot, Comptroller of Maryland
The Honorable Nancy Kopp, Treasurer of Maryland

Katelyn Davis

This entire project should be scrapped in favor of expanding the red line. The simple fact this project does not include an expansion of the red line defies logic. A 8 car metro train carries approximately 400 people (8 cars, 50 people per car). Metro runs the every trains 2-6 minutes during rush hour, which is 800-2400 people per 6 minutes. A car carries 8 people MAXIMUM. A bus carries 60 people. The ONLY way to reduce congestion, prevent future congestion and improve the environment is to expand trains. I don't need to an environmental impact to tell me expanding 270-495 which cause irreparable damage to our local and global environment, contribute to climate change and degrade our water quality, cause additional stream run-off and pollution, and harm air quality.

Name: Patrice Davis

Joint Public Hearing Date: 8/18/2020

Type/Session: Live/Morning

Transcription:

Hi, my name is Patrice Davis, D-A-V-I-S. I live at [REDACTED] Martins Lane, Rockville, Maryland, 20850. I have a child that attends Julius West Middle School, already too close to I-270. It will be even closer if this is allowed to proceed. I do not support any planned expansion of I-270. I support a No Build option. I do not support any plan that allows wealthier people to bypass traffic while low-wealth people are subject to more traffic and breathing, breathing in more exhaust fumes. In this case, social justice and environmental justice go hand in hand. I believe this project violates Title VI. I would like to see a plan that includes electric-only vehicle expressways and commuter lots to encourage carpooling and group ridesharing in electric vehicles. It should be planned in coordination with the new express lanes for busses on Route 355. This could benefit the environment and people of all income ranges.

Based on the current options, I think a preferred alternative should not be chosen until the true monetary cost and environmental costs are known. Since no one knows how much the for-profit company will charge, I asked people I know in Miami and Virginia where a similar for profit scheme took place. They usually pay between 5 to 20 dollars in tolls to commute one way to work. These for-profit highways have a reverse incentive to cause more traffic and more pollution in order to bring in more profit. The people in Virginia and Miami have only seen increases in traffic and commute times because no one is putting a cap on new construction or investing in other commuting options.

For the sake of argument, let's say it is five dollars one way to commute on I-270, commuting five days a week with two weeks off for vacation, you will pay two thousand five hundred dollars in tolls, also known as a commuter tax. I believe five dollars is a very low estimate. We don't yet know how much Maryland citizens will be required to pay for the privilege of sitting in traffic. If you can easily add two thousand five hundred dollars in tolls to your commuting expenses, good for you. But I ask you to step outside of your bubble for a moment. In 2018, 33 percent of Maryland's workforce earned less than fifteen dollars an hour. The income gap is projected to grow once the dust settles from this pandemic. The people that were determined to be essential workers during this pandemic, such as grocery store employees, janitors, and home health aides usually make minimum wage. You might have put a sign in your car window to thank them. But what they really need is for you to speak out against these unfair practices. This commuter tax is just another way to tax the poor and middle class for not being able to afford to live close to their jobs. Low-income workers can't afford to take a day off to participate in these type of hearings; it's just another luxury they don't have. If you care about Montgomery County and Frederick County, don't allow elected officials to sell us out for a quick buck.

Patrice Davis

I am a Psychiatric Nurse Practitioner in Montgomery County. I work with many minority and low income clients. Often clients have to decide if they can pay for a prescription or buy food or put gas in their car... Many of the staff I work with can't afford to live in Montgomery County and have long commutes. They can't afford tolls. I support the NO BUILD OPTION. There is the cost of the express lanes, lack of investment into public transportation, and the health consequences of people who can only afford to live close to the highway. I believe this is a violation of Title VI of the Civil Rights Act of 1964. I will explain why this project will have a disproportionately high and adverse impact in low-income and minority communities.

The plans released are woefully lacking in details about how much it will cost to commute. There is no detailed analysis of public transit/multi-modal transit alternatives. We don't know if there will be caps on how much the for-profit corporations can charge motorists. We don't know the income levels or race/ethnicity of the people who currently live close to the highway. From my limited research, there are some homeowners and some higher density housing which have minority populations.

We don't yet know how much Maryland Commuters will be required to pay or if there are any caps on how much they can charge. The MWCOG calculation on page 883 of Appendix C of the environmental report provides figures per mile, but it is hard to understand. Based on these figures, and what is being charged in Northern Virginia (for a similar for-profit highway scheme), estimates between \$28-\$48 seems reasonable. Commuting 5 days a week, with 2 weeks off for vacation, a commuter would pay \$7,000-\$1400 in tolls per year.

If this is not a shocking number to you, I ask you to step out of your bubble for a moment. In 2018, 33% of Maryland's workforce earned less than \$15 per hour. The income gap is projected to grown, once the dust settles from this pandemic. Most local food pantries require a car for pick up.

This is another way to tax the poor and middle class, for not being able to afford to live close to their job. That includes many in healthcare. At the start of the pandemic, we learned how much we need our "essential workers"; many of whom make minimum wage and have long commutes. One thing you could do to thank them, is to stop this discrimination. I do not support any plan that allows wealthier people to bypass traffic, while low wealth people are subjected to more traffic and more pollution. There is a disproportionately high adverse impact to low-income communities. This is probably also true of minorities, but no one has done comprehensive research.

Patrice Davis

I live and work in Montgomery County. I support the no build option because this plan will not improve congestion on 1-270, is going to cost me as a tax payers and is going to cause more pollution. The toll revenue is all going to a private corporation, and NOT into creating better transportation options. The current available plans are NOT GOING TO significantly REDUCE TRAFFIC. In some areas, like north of Montgomery Village, it is projected to increase commute times. Every day people will get stuck with the bill to move all of the drainage areas along the highway and some other construction costs. Local Jurisdictions will have to pay to rebuild the Bridges that go over the highway to accommodate the wider highway below). They will also be stuck with the bill to rebuild local road if there are changes to the entrance ramps, road signs, and lighting. All of this additional construction has a financial and environmental impact, which is not included in the environmental review. This process reminds me of a shell game of changing information and intentionally withholding of information to confuse commuters, tax payers, and Government agencies.

Patrice Davis

Governor Hogan has no right to give I-495 and I-270 to a private corporation for FREE. It belongs to the tax payers of Maryland. I support the no build option. Governor Hogan also agreed to spend additional tax payer dollars (\$2 billion to move WSSC pipes) before handing it over. In a public private partnership, the corporation does NOT have citizens best interests at heart. Their goal is NOT bring us less congestion, or worry about the environment. A corporations mission is to MAKE MONEY. For-profit highways have a reverse incentive to cause MORE traffic, in order to bring in more money. More traffic causes worse air pollution. The DEIS appears to discount projected increases in air pollution, despite a clear incentive on the part of the for-profit corporation to increase congestion. In conclusion, the State is paying for massive work on the highway before giving it to a for-profit company for FREE, this has environmental impact, then there will be massive impacts to the environment and health during the construction only to increases pollution after.

Subject: 497/270 Beltway Expansion I OPPOSE THIS PROJECT AND SUPPORT THE NO-BUILD OPTION

I OPPOSE THIS PROJECT AND SUPPORT THE NO-BUILD OPTION.

I live just two blocks inside the Beltway - off Route 29/Colesville Road. The Congestion on Rt 29 is already unbearable, this project will directly impact my ability to drive downtown Silver Spring or run up the University Blvd to the super market. Running a short errand will be slowed considerably with construction work on the Beltway and even worse if it is carrying more cars after the widening project.

This will contribute more air and noise pollution to an already stressful level.

We will lose the YMCA, where we swim and exercise.

We will lose the Golf Course where we have open green space and play golf.

The Sligo Creek will be destroyed by additional highway water run off.

My water bill will increase to an unaffordable level due to construction to move water and sewer pipes to accommodate the expanded beltway.

Regina Davis
[REDACTED] Lorain Avenue
Silver Spring, MD 20901
[REDACTED]

I OPPOSE THIS PROJECT AND SUPPORT THE NO-BUILD OPTION.

RICHARD DAVIS

I support the "No Build" option. Any and all efforts to relieve congestion should focus on methods that reduce the total number of vehicles on these thoroughfares. Greater emphasis on improved Mass Transit (To include Commuter Bus Lanes on existing roadways) would better serve the community as a whole, and the economically underprivileged, in particular. In addition, the insufficient study of the environmental impact of the proposed expansion leaves glaring gaps in our knowledge of the hazard posed to the general health and well being of those who live in vicinity of the project.

Robert davis

NO NO No..To use my tax dollars to create lanes for the rich and self-important is not acceptable.
We have needed additional lanes for 40 years for everyone.
THIS IS UNACCEPTABLE.

Name: Rory Davis

Joint Public Hearing Date: 8/18/2020

Type/Session: Live/Afternoon

Transcription:

Hi, I'm Rory Davis, and I have called multiple times and from multiple phones, have been in the queue, even though it claims there are no more speakers. My name is spelled R-O-R-Y D-A-V-I-S. I live on [REDACTED] Martin Square Lanes. I'm sorry, [REDACTED] Martins Lanes, Rockville, Maryland, 20850, and I oppose expanding Highway I-270. I was a student at Julius West Middle School last year and from researching over 700 studies done by the Health Effects Institute, they learned that if you live 300 to 500 meters away from a highway, you are at a higher risk of getting asthma as a child, and if you have asthma, it may increase asthma attacks. Also it causes impaired lung function, premature death, and deaths from cardiovascular diseases. Julius West Field is only 35 meters away from I-270. Before Corona, the students were required to run the track lap before PE. The school building is only 253 meters away from the highway. It is already too close. I believe that we should do air quality tests that are done outside, not just inside. Currently, they only do indoor air quality tests. Despite the lack of testing, they're telling us it is safe [inaudible] increased cars on the highway. This can only make air quality worse. This is a problem, especially since they are planning on expanding it and turning it into a for-profit highway that benefits an Australian corporation at the expense of American children and American families that live right next to the highway. Don't ruin the lives of children for the sake of profit. I yield my time.

Rory Davis

Last year I was a student at Julius West Middle School. It is located right on I-270. That is why I support a NO BUILD option.

Julius West Middle School is currently LESS THAN 300 meters from highway I-270. It is 258 meters from the highway to the media center, which is located in the center of the building.

Projections say if this project is allowed to proceed it could be even closer. After analyzing 700 studies, the Health Effects Institute concluded that less than 300 meters from a highway is considered the DANGER ZONE. Before the pandemic, children ran the track lap before PE class. The track lap currently is ONLY 35 meters from I-270. Montgomery Blair High school also has their athletic field right along I-495. Children and teens are taking deep breaths, where particulate matter is high. That is a major risk factor in developing asthma. This highway is being given away for free. All the profits go to a private company instead of going to Maryland for better transportation or better schools.

There are large minority populations at both Julius West Middle School and Montgomery Blair High. The make-up of Montgomery Blair is approximately 33.8% Hispanic, 23.7% African American, and 14.4% Asian. The Julius West student body is approximately 26.3% Hispanic, 17.5% Asian, and 16.4% African American. I believe the location of this project is discriminatory since it has a disproportionately high adverse impact on minority students.

Options that encourage electric vehicles or mass transit would decrease the risks for the 1300 students who attend Julius West Middle School and the 3000 students who attend Montgomery Blair High school. Please think about the next generation.

Subject: Opposition to Beltway Widening

To whom it may concern:

As a resident and voter living in Silver Spring, Maryland, I strongly oppose the widening of the beltway and I-270

1. We need all-day, two-way, frequent MARC train service between Frederick and Union Station, with stops including Germantown, Gaithersburg, Rockville, Kensington, and Silver Spring. This is the most cost-effective way to increase mobility in the 270 corridor, and it's better for the environment, too. Yet the state refused to study it or any other all-transit alternative.

2. The toll lane plan will increase traffic congestion. Nobody will pay high tolls to drive in the new toll lanes unless the "free" lanes are backed up. And all of those additional cars will end up in even bigger back-ups on local roads like Route 29, Connecticut Avenue, and Old Georgetown Road. **This will not benefit the average commuter who cannot afford the tolls and, in fact, will make things more difficult.**

3. The toll lane plan doesn't work financially. On the one hand, the private toll-lane operators must set high rush-hour tolls (\$2 per mile or more) to recoup their costs and make a profit. On the other hand, most drivers will be unable or unwilling to pay tolls that high. So where will the money come from?

4. Originally Governor Hogan said that the toll lane plan would not cost the public anything. But we keep learning about more things the public, not the toll-lane operators, will pay for. Who will have to pay a billion dollars to move water and sewer pipes? We will. Who will be left holding the bag if the toll-lane builders walk away from the job and demand more money? We will.

I am in favor of workable and pragmatic solutions - widening the beltway is not one of them.

Sincerely,

Jennifer Davison

JACK DAWSON

I-495 & I-270 Managed Lanes Study DEIS/ Draft Section 4(f) Evaluation

I would like to say that Governor Hogan's I-495 & I-270 Expansion Project does not have help the community as its primary goal. If it did, it would alleviate the already existing abundance of noise and pollution caused by current traffic conditions. The project's goal of reducing traffic congestion is a pie in the sky, it has not been fully proven, nor has its endurance over time.

In Montgomery County, residents need & want to maintain green space for physical & mental health. Living in Montgomery County is about a balance in the long run; here, that means what is best for our community is a balance between plenty of transportation choices and enough quality green space. Look, for instance, at the role Central Park plays in Manhattan in New York. That park is cherished and preserved by New Yorkers for the benefits it provides.

Invest more in making streets walk-able with bike lanes. In PG County, All Saints Rd. between Whiskey Bottom Rd. and Scaggsville Rd. is a great example of pedestrian-friendly conditions: wide streets, plenty of parking, sidewalk far enough away from traffic for a buffer to exist between pedestrians and traffic. Plus, no telephone poles to boot

Or the sidewalk in front of Blair High School is another example of a sidewalk - a wide one - somewhat away from traffic for a buffer to exist between pedestrians and traffic.

Why not increase use of MD-200 (ICC)? That is existing highway in need of more use.

Lastly, build up the walls of I-495 that separate that highway from residential neighborhoods. They are not sufficient as they exist for air & noise pollution concerns.

Judy Dawson

Re: 495 & 270 expansion toll hwy.....First and foremost, this project would increase the noise and traffic pollution already in normal capacity conditions on the roadways. The present expansion on the 495/95 tolls on VA side do not alleviate heavy traffic conditions. Why not utilize the current 200 toll roads to lessen the traffic away from 495? And decrease the actual tolls there to increase volume of usage.

Living nearby 495, the concrete walls do nothing to decrease or minimize noise level in an already urban dense traffic area. Increased public transportation would be helpful especially with increased frequency of service.

Aside from increased noise and traffic pollution, we do not need to decrease the green space in the current area for an unnecessary and invasive project to the current residential community in the impacted areas. Increased noise, traffic and emissions from cars would be harmful to the adjacent population for health issues as well.

This project is not about helping the current communities. This project is unnecessary and foolish on the whole. I as a current resident of Woodmoor (Montgomery County) do not want my taxpayer dollars to fund this project in any matter. If you truly want to help the communities of 495/270 corridor, as the residents and constituents who actually live in the areas what public services are needed or what needs to be improved on the whole for Montgomery County.

Molly Dean

Please preserve Rock Creek Park. It's one of few natural escapes in the city and should be protected.

Perry degener

I write in opposition to the potential changes to I-495 and I-270 due to the collateral impact it will have on the Capitol View Historic District.

--Perry Degener

Mary Deinlein

I am not in support of expanding 270 and 495. We need affordable transportation for all commuters, not "luxury lanes" for the rich. This project ignores the serious crisis we are all facing due to climate change—it will add to the problem rather than solve it. The environmental damage that will be done through clearing of hundreds of acres of parklands further contributes to climate change and diminishes the quality of life for all of us.

Herman DeLang

This PROJECT MUST BE BUILT the silent mahority of Hundreds of Thousands of people should supercede the minimal impacts to a couple of dozen homeowners or folks living adjacent to a major highway.

For one, when anyone buys next to a major highway, they already are buying into the noise and direct localized impacts form living next to a highway, as well as the possibility the highway may need to be expanded in the future. So no excuses please

This must be built for the quality of life of my Family, and everyone that I know - hundreds of people that travel these routes regularly.

Further, it is a major safety issue, as the overloaded current configuration is an increased danger to everyone that travels upon it - and including those people that live adjacent to the highway from the threat of crashes and release of toxic crash related pollution, whether from truckload or energy source fires.

Subject: I-495 I-270 - BUILD IT!

PLEASE BUILD THIS PROJECT, AS ADDED CAPACITY AND THROUGHPUT IS THE ONLY RATIONAL SOLUTION FOR A GROWING METRO AREA.

TRANSIT DOES NOT WORK IN A DISPERSED SUBURBAN COMMUNITY, WITH NO CBD AS THE BELTWAY AND I270 PROVIDE TRANSPORTATION TO!

PLEASE BUILD THE EXTRA LANES IN THE BEST AND RECOMMENDED OPTION - ADDING LANES!

THIS IS THE SILENT MAJORITY, AND VAST SUPPORT, WHILE IMPACTING PERHAPS A FEW DOZEN PEOPLE VIA PROPERTY BUYOUTS, EVERYONE ELSE WILL EXPERIENCE IMPROVED STANDARD OF LIVING - LOWER POLLUTION, MORE TIME WITH FAMILY AND FRIENDS.

Patrick Delfert

It is imperative that the American Legion Bridge be expanded, along with I-495. There is currently a severe bottleneck on the bridge for commuters that backs up traffic for many miles in both directions. This bottleneck adds 30 minutes to each commute. This is not only a terrible waste of time for many thousands of people, but it also causes a large amount of pollution in the area as cars sit in traffic.

Subject: Beltway Project

Dear Ms. Choplin:

I am writing with respect to the draft environmental impact statement (DEIS) for the proposal to add private toll lanes to the Beltway and I-270. I oppose the plan to add toll lanes and I support the no-build option.

The National Environmental Policy Act (NEPA) requires consideration of how a project impacts Environmental Communities (EJ), or communities primarily made up of people of color and people with low-incomes. NEPA requires that the DEIS compare the impact of the project on EJ communities with the impact on non-EJ communities, in order to determine whether the negative impacts of a project fall disproportionately on EJ communities. Yet the DEIS does not include such a comparison.

The Beltway runs through many EJ communities, especially in Prince George's County. We know that those living near highways are exposed to increased vehicle emissions which have a harmful impact on health. But the DEIS fails to identify or evaluate how pollutants from increased traffic will impact EJ communities.

I urge MDOT to address this deficiency in the DEIS and to examine how the project impacts EJ communities compared with non-EJ communities.

Sincerely,

Alejandra Delgado

Date/Hearing: 8/25/20

Type/Session: Live/Morning

Transcription:

My name is Emiliana Delgado. That is E-M-I-L-I-A-N-A. Delgado, D-E-L-G-A-D-O. I live at [REDACTED] Hannes Street, Silver Spring, Maryland 20901. And I oppose the Project to add private toll lanes to I-495 and I-270. I support a No Build option. Governor Hogan and the Maryland Department of Transportation have repeatedly stated that adding private toll lanes will cost Maryland taxpayers nothing, but the Washington Suburban Sanitation Commission estimates that the water customers will pay two billion dollars to move water and sewer lines for this project. Moreover, according to the Draft Environmental Impact Statement, as much as one billion dollars in taxpayer subsidies will be paid to the Tollway Developer, but the DEIS fails to consider whether more employers will adopt telework on a permanent basis in the future and whether reduced traffic will require more subsidies for the Developer. According to the DEIS, the Project will lead to increased particular matter. Par, yeah, carbon monoxide, ozone, nitrous dioxide, and greenhouse gas emissions. The Project will increase highway capacity putting more vehicles on the road and increase in greenhouse gases, but there is no plan to mitigate these emissions. This move, this moves Maryland backwards in our efforts to reduce global warming pollution. According to Appendix C of the DEIS, rush hour congestion will actually increase on I-270 North. So after enduring increased traffic congestion during the four or five years of construction on I-270, commuters and other users of I-270 North will be rewarded with worse traffic. Finally, I want to comment on the tolls. The DEIS provides average tolls, but does not tell us what the tolls will, what the tolls will be during rush hours when they will be at their highest. Obviously, you can arrive at an average toll if you have estimates for tolls during rush hour. Why doesn't the DEIS reveal how high rush hour tolls will be? What is MDOT hiding from the public? In closing, I repeat that I oppose this Project and I support a No Build option. Thank you so much.

Marc DelMonico

Overall, this effort seems ill advised. Creating toll lanes on I-495 and I-270 will only cause traffic to increase on non-tolled local roads for those that can't afford the tolls and will create a tiered "pay to access" for use of critical infrastructure funded by all residents taxes and which should be accessible to all.

A public-private partnership will not be a good deal for the state. Taxes should properly fund infrastructure.

Each of the build alternatives would require the government taking and relocating 25-34 homes. It would also destroy hundreds of acres of parkland and historic properties, and would directly affect nearly 1,500 properties. Widening the beltway to include even more traffic while doing little or nothing to enhance public transit options in that corridor is short sighted.

I do not support the proposed expansion or the addition of toll lanes.

Subject: Comments on Highway Expansion Project

Dear Maryland Department of Transportation,

My name is Michael DeLong, I live in Silver Spring, and I am writing to comment on the I-495/I-270 expansion and its draft environmental impact statement. **I oppose this highway expansion project and support the No-Build option-I believe it is a bad idea that will lead to more traffic and pollution, and not improve the quality of life in our communities.**

Expanding the highway will lead to more cars on the road, leading to more pollution and contributing to climate change. We should be pushing for better public transit and alternatives to cars-we already have too much traffic. Adding more cars is not the solution.

And the project will negatively impact a number of local parks. Numerous studies also show that expanding highways almost never result in the desired reduction of traffic and congestion. Finally, the draft environmental impact statement is seriously flawed, and does not examine other alternatives.

Thank you very much,

Michael DeLong

Name: Sandra Dembski

Date/Hearing: 8/25/20

Type/Session: Live/Morning

Transcription:

Sandra Dembski, S-A-N-D-R-A. Dembski, D-E-M-B,_like Beltway,_S-K-I. [REDACTED] Hamilton Spring Road, Bethesda. Um, I live in Carderock Springs, a community on the National Register of Historic Places. Because time is short, I will only focus my comments on issues that directly affect my community. But I must say that I support the comments of the previous speakers earlier this morning. I've reviewed parts of the Draft Environmental Impact Statement.

First, I strongly disagree with the findings of Appendix F that the Beltway expansion will have no effect on Carderock Springs. Carderock Springs is on the National Register as an example of situated mid-century modernism. This includes preservation of natural environment. A band of trees currently separates us from the Beltway and I firmly doubt that the Beltway can be expanded without destruction of trees. Trees are so important to the community that we have covenants that require permission from a neighborhood tree committee to take down mature hardwood trees. These trees also help mitigate the noise and pollution effects of the current Beltway. The preliminary design of the Beltway Project could require expansion into the backyard of some of my neighbors and presumably the destruction of their trees. It's difficult how this can be construed as having no effect on this historic community. There is no way to mitigate the destruction of 60-year-old trees. In addition, the disturbances into private property would lower property values. Of course, it's, if any Beltway expansion where to remain within that existing right-of-way, this would be an improvement. Appendix J notes its sound barriers along the boundary of Carderock and Carderock Springs Elementary School are both feasible and reasonable. Construction of sound barriers is critical for the community and especially from the brand-new elementary school. Almost four hundred children attend the school and the playground and playing fields abut the Beltway. These children need to be protected from Beltway noise and pollution.

I would recommend that the State include in any contract, as a cost of construction, the inclusion of all sound barriers found to be feasible and reasonable, not only in Carderock but a length around the length of the Beltway Project. In addition, [INAUDIBLE] the Beltway Project goes forward, that sound barriers be constructed early in the process to protect students and residents: county residents, community residents, from the noise and pollution which would accompany [INAUDIBLE] construction. Subject: No more lanes on beltway

Please do not even think more about widening the beltway and taking away park land (Sligo Creek) and neighborhood in Montgomery County. The beltway will only cause more congestion. The privately run toll lanes are an insult to the tradition of public transportation started by President Eisenhower and having a public-private partnership has not worked at all seeing the botched situation on the Purple Line now - all torn up and no place to go. Toll Lanes, even with Easy Pass will back up traffic and cause accidents and put more burden on our County for emergency services.

Please consider better mass transit such as making Marc train to Frederick more frequent daily and on weekends (it is ridiculous that people who work a half day in Rockville have to drive in) (people will take metro and Marc to visit Frederick as reverse tourism also) and monorails (on the I270 corridor) to save our air pollution and living environment and general well being of citizens of Maryland.

Paula J Desio
[REDACTED] Quincy Street
Chevy Chase MD 20815

Bryan Detchon

I think highway expansion is a bad idea when traffic patterns are changing due to the coronavirus, because I don't believe in cockamamie "partnerships" that allow the private sector to make money off our roads, and because we need to find new ways to move people that are more climate-friendly:

The study is premised on congestion and traffic patterns that pre-date March 2020. Tollway revenue in Maryland is down 40% and hundreds of millions of dollars due to COVID-19, and tollway operators across the country have sought billions of dollars in taxpayer bailout money.

Despite promises that the proposed expansion will pay for itself through managed toll lanes, the DEIS shows that the build alternatives might require a state subsidy paid to the developer ranging from \$482 million to more than \$1 billion.

The DEIS fails to take the required hard look at the human health and environmental impacts of the proposed expansion and omits analysis of public transit options that would be viable when considered against the entire project.

The DEIS does not analyze how increased stormwater runoff from the proposed expansion will impact local waterways or how the increase in polluted stormwater runoff will impact downstream waterways, and the DEIS fails to sufficiently address how degradation to waterways and wetlands will be mitigated.

For these reasons and more, I believe the project will harm Maryland citizens and their environment and cannot be justified.

Samuel Deutsch

I grew up just blocks away from the beltway. I had my first asthma attack when I was eight - I thought I was going to die. I was gasping for air and we had to rush to the ER in the middle of the night to get a breathing treatment.

I have lived with asthma for my entire life since. It has put me in the hospital multiple times. I have had to be especially careful during this pandemic to avoid contracting COVID-19 due to my high risk as an asthma sufferer.

I strongly oppose expanding the beltway and I-270. There is countless literature showing how proximity to large freeways drastically increases the risk of asthma, birth defects, and other dangerous health conditions. While it is impossible to know if living blocks from the beltway is what caused my own personal asthma, we do know that the increased emissions from expanding the beltway will increase the number of children who are forced to suffer as I did. The decision to potentially expand these highways will have lasting health impacts that will reverberate for generations. Please say no to this mistaken project and instead choose to invest in the future by building environmentally sustainable mass transit.

Thank you.

Subject: Letter supporting the I-495 No Build Option

My name is Erik Devereux. I reside in Silver Spring, Maryland. I am a registered voter who votes in every election local and national. I am a homeowner who resides within 1 mile of I-495. I have regularly used I-495 and I-270 for work commuting.

I strongly support the No Build option for I-495 and I-270. I strongly oppose any effort to wide either roadway including options that involve toll lanes.

Our world is coming to a juncture in which the transportation modes of the past simply must be replaced with new modes that do not add to the carbonization of the atmosphere and to reliance on single-passenger vehicles. The current effort by the State of Maryland to wide I-495 and I-270 harkens back to the 1950s not the 2050s. It is antiquated and short-sighted.

I do not believe there is any chance the proposed projects to widen I-495 or I-270 will be achievable under the budget currently proposed or without asking Maryland taxpayers to pay for more than \$1 billion in related construction. We have just endured four years of a presidential administration that systematically lied to its citizenry. Now the State of Maryland is embarking on this foolhardy project by also lying to its citizenry, further undermining basic trust in government. This simply has to stop if our democratic institutions are to survive. Anyone who faces the facts about I-495 and I-270 will see that widening these highways is a bad idea from the start. Please follow the facts.

Instead of this project, the State of Maryland needs to finish the Purple Line, invest in bus rapid transit, and restore the Red Line project in Baltimore. In the longer term, we need high speed commuter rail to link the major urban and suburban centers of the state and begin to move away from reliance on the automobile. We need to embrace a much better future for the residents of Maryland.

Sincerely,

Erik Devereux

Subject: comment on the Draft Environmental Impact Statement

Dear Sir or Madam:

I am writing to express my opposition to widening the Maryland section of I-495 and my support for the “no build” option. Any such scheme would have a disastrous impact on the homes and businesses in my community and would be unlikely to result in any real benefit for Maryland commuters. I am also particularly concerned about the environmental impact on our local parks.
